ARA Personal Server Log Stops Adding Entries (1/95)

Revised: 1/25/95
Security: Everyone

ARA Personal Server Log Stops Adding Entries (1/95)

=====

Article Created: 25 January 1995

TOPIC -----

My Apple Remote Access (ARA) Personal Server is able to dial out and users can dial in, but the log has stopped logging any activity.

DISCUSSION -----

Drag both the Apple Remote Access Preferences and the Apple Remote Access Log, in the Preferences Folder within the System Folder on the Server, to the trash, then restart the Server. Apple Remote Access should start logging activity.

WARNING: Be certain you throw away both files mentioned above. Dragging only one file to the trash will cause the server to crash when using ARA.

Apple Remote Access, PowerBook Duo 230, and Error -23 (1/95)

Revised: 1/25/95
Security: Everyone

Apple Remote Access, PowerBook Duo 230, and Error -23 (1/95)

=====

Article Created: 25 January 1995

TOPIC -----

When I use Apple Remote Access (ARA) on my PowerBook 230 with an Express Modem, and I attempt to open a connection; I get the following error message:

"The connection attempt has failed. An unknown error of type -23 has occurred.", or "The connection attempt has failed. An unknown error of type -20 has occurred."

What is causing this?

DISCUSSION -----

System 7.5 has the Extensions Manager control panel, which lets a user turn extensions and/or control panels on or off. The Express Modem control panel has been disabled through the Extensions Manager. Enabling the Express Modem control panel and restarting will correct the error.

System 7.5: The Print Shop ATM Errors and ATM GX (1/95)

Revised: 1/26/95
Security: Everyone

System 7.5: The Print Shop ATM Errors and ATM GX (1/95)

Article Created: 26 January 1995

TOPIC -----

Customers may call experiencing an Adobe Type Manager (ATM) error when using Broderbund's The Print Shop with System 7.5.

DISCUSSION -----

According to Broderbund tech support, customers using The Print Shop 1.0 and 1.1 may get an ATM error indicating that a certain font cannot be found, at which point the Macintosh may crash. This occurs when ATM is not installed.

Recently Broderbund tech support has erroneously been recommending that customers run a Custom Install of QuickDraw GX and install only ATM GX, without the other QuickDraw GX software.

However, QuickDraw GX enables fonts upon installation. Font enabling still occurs with the custom install of ATM GX making Type 1 fonts unusable if the customer does not have QuickDraw GX installed, thus creating other problems for the customer.

Broderbund tech support has been made aware of the issues involved with a QuickDraw GX installation and should be modifying their tech database and no longer instructing customers to perform a QuickDraw GX custom install.

The recently released Print Shop Deluxe CD Ensemble includes The Print Shop 1.1.1 and does not appear to exhibit this problem. The Print Shop Companion 1.0 (included on floppies with the CD Ensemble) also does not seem to exhibit this problem. The Print Shop 1.1.1 is not currently available on floppies for customers already owning 1.0 or 1.1. They do, however, have an upgrade path available to the CD Ensemble.

System 7: Network Control Panel Pre-Installed or Not? (1/95)

Revised: 1/26/95
Security: Everyone

System 7: Network Control Panel Pre-Installed or Not? (1/95)

=====

Article Created: 25 January 1995

TOPIC -----

Is the "Network Control Panel" pre-installed on all System 7 or later Macintosh computers? Please include Macintosh Performa models in this discussion.

DISCUSSION -----

The Network Control Panel is not normally pre-installed on a Macintosh system that only has LocalTalk capability.

On a machine, such as a Quadra or Power Macintosh that comes with built-in Ethernet, it will be pre-installed since there are two network interfaces to choose between: LocalTalk or EtherTalk.

In the Macintosh Performa line of computers, Ethernet is usually an optional capability. The exception to this rule is the Performa 61xx series which all have built-in Ethernet. However, unlike most Macintosh models, the Performa models usually will have the Network control panel pre-installed whether they have built-in Ethernet or not.

How to install the Network Control Panel:

- It can be installed from a Network Software Installer disk.
- It can be installed by selecting a Custom Install from the System Software disks.
 - If installing from System 7.0, 7.1, or System 6.0.x disks, choose EtherTalk from the custom install selections.
 - If installing from System 7.5, choose Network from the Control Panel options in the custom install selections
- It can also be installed by running the installer for any one of several Apple Remote Access products.

DOS Compatibility Card: LaserWriter Select Print Problem (1/95)

=====

Article Created: 26 January 1995

TOPIC -----

I have the DOS Compatibility Card for the Power Macintosh and when I try to print to the LaserWriter Select 300 from Windows, the Macintosh side freezes. I have to restart my Macintosh.

DISCUSSION -----

This is a known problem with the LaserWriter Select printer driver and Background printing. In order to print properly, turn off Background printing and do not use the QuickDraw GX printer driver.

DOS Compatibility Card: DOSClip Causes DOS Crash (5/96)

Article Created: 26 January 1995
Article Reviewed/Updated: 22 May 1996

TOPIC -----

I am using Harvard Graphics v3.0 on the DOS Compatibility Card and when I try to copy from the MS-DOS environment to the Macintosh OS, and then go back to the MS-DOS environment, the system crashes. The message I get is:

"Memory allocation error
Cannot load COMMAND, system halted"

DISCUSSION -----

This problem is caused by not loading the SmartDrive into high memory. To correct this you need to change your CONFIG.SYS and AUTOEXEC.BAT files.

In the CONFIG.SYS File
=====

Add the following line:

If you are using PC Setup 1.0.7 lines are:

DEVICE=C:\DOS\EMM386.EXE NOEMS X=C800-CFFF RAM=D000-EFFF

or

DEVICE=C:\DOS\EMM386.EXE X=C800-CFFF RAM=D000-EFFF

For PC Setup 1.5, the lines are:

DEVICE=C:\DOS\EMM386.EXE NOEMS I=CA00-CBFF X=CC00-CFFF RAM=D000-EFFF

or

```
DEVICE=C:\DOS\EMM386.EXE I=CA00-CBFF X=CC00-CFFF RAM=D000-EFFF
```

Also change the following line:

From - DOS=HIGH to DOS=HIGH,UMB

In the AUTOEXEC.BAT File

=====

Placed LH before C:\DOS\SMARTDRV.EXE /X in the autoexec.bat.

Article Change History:

22 May 1996 - Added new config.sys memory lines for PC Setup 1.0.7

DOS Compatibility Card: IRQ settings Hard Coded (1/95)

Revised: 5/24/95
Security: Everyone

DOS Compatibility Card: IRQ settings Hard Coded (1/95)

=====

Article Created: 26 January 1995

TOPIC -----

I have the option in a MS-DOS application program to change the Sound Blaster IRQ setting through the software. However when I do, I still hear music. Why?

DISCUSSION -----

IRQ settings on the DOS Compatibility Card for the Power Macintosh are hard coded. However, the Synthesis portion of the card still functions with the invalid IRQ settings. If you Select digital sound with the invalid IRQ settings, you will not hear anything. You need to select the proper IRQ settings for the card in order to use both part of the Sound Blaster card.

DOS Compatibility Card: Macintosh Must Have Some RAM (1/95)

=====

Article Created: 26 January 1995

TOPIC -----

I have a Power Macintosh 6100 with the DOS Compatibility Card and when I set the Shared Memory to 8 MB I get an error when I restart. The message explains that there is not enough memory to load all of the extensions.

DISCUSSION -----

The Macintosh OS needs enough memory to operate normally. If you assign a large portion of memory as shared memory, you need to make sure that you still have enough memory left for the Macintosh operating system (OS) to operate normally. The PC Setup control panel does not do any verification of how much memory you have assigned as shared memory. You must make sure that you are not assigning more memory than you have available as shared memory. For example, if you have 8MB of RAM installed in your Macintosh and set the PC Setup control panel to 4 MB of shared memory you could run into problems if the Macintosh OS takes up more than 4 MB of RAM. If you run into this problem, the best solution is to purchase additional RAM. You can also try to reduce the number of extensions and control panels. This reduces the amount of RAM the Macintosh OS requires.

DOS Compatibility Card: Cannot Convert Custom Clipboards (1/95)

=====

Article Created: 26 January 1995

TOPIC -----

I have a DOS Compatibility Card for the Power Macintosh and I am trying to copy Adobe PhotoShop clipboard contents to the Macintosh. But, when I copy the contents from Windows and switch over to the Macintosh there is nothing in the clipboard.

DISCUSSION -----

Adobe PhotoShop and a few other high-end Window paint application programs use their own clipboard instead of the Windows clipboard. Some applications have ways of setting the preferences so that they convert things into the Windows clipboard format. In applications like Adobe PhotoShop that do not allow you to change the clipboard settings, there are a couple of options.

- 1) Open the Window application Clipboard Viewer before you switch between the Windows and Macintosh platforms. This forces Adobe PhotoShop to convert the clipboard into a standard Windows format.
- 2) Minimize Adobe PhotoShop. This also forces Adobe PhotoShop to convert the clipboard into a standard Windows format.

AppleShare & GraceLAN: Network Trash Prevents Disconnect (2/95)

=====

Article Created: 26 January 1995
Article Reviewed/Updated: 1 February 1995

TOPIC -----

As the administrator of our AppleShare server, I'm using GraceLAN to limit the time clients can access the server. The users have discovered that if they put something in the trash from the server but not empty it, GraceLAN will not disconnect them. Is there a workaround to this problem?

DISCUSSION -----

Yes, do not give the client users write access to the root level. This will prevent the Network Trash from creating a folder. AppleShare needs write access to the whole volume to create the Network Trash Folder (which is invisible). When the client puts anything in the trash they will get the message: "Filename cannot be left in the trash. Do you want to delete it immediately?"

Security Lock Ports on Desktop Macintosh Computers (7/95)

Revised: 7/7/95
Security: Everyone

Security Lock Ports on Desktop Macintosh Computers (7/95)

Article Created: 27 January 1995
Article Reviewed/Updated: 07 July 1995

TOPIC -----

What type of security lock ports do the desktop Macintosh computers have and where are they located?

DISCUSSION -----

Security lock ports are used to physically lock desktop Macintosh computers to a desk or other stationary object using some kind of cable locking system.

Apple uses four different types of security lock ports on Macintosh computers. They are as follows:

PORT TYPE	DESCRIPTION
Large rectangular port	This is the original security port used on the first Macintosh computers. It is a rectangular port that measures approximately 6mm x 35mm at the opening.
Small rectangular port	This is a slightly smaller rectangular port that is used on the majority of Macintosh computers. It measures approximately 6mm x 22mm at the opening.
1/4" Mini-slot port	This is the most recent security lock port. This port is a small, 3mm x 7mm, opening without latches of any kind. It uses a different type of security device than the previous security lock ports.
Cable Slotted port	This is a plastic loop on the bottom of the unit that is intended to have a security

cable fed through it.

Use the following chart to determine which type of security device you need for your Macintosh computer.

NOTE Generally, security lock ports are located on the back panels of most Macintosh computers or, in the case of the cable slotted port, on bottom panels.

PRODUCT DESCRIPTION	PORT TYPE	LOCATION
-----	-----	-----
Compact Macintosh Systems		

Macintosh 128K	Large rectangular port	Right center
Macintosh 512K, 512Ke	Large rectangular port	Right center

Apple MessagePad 120: Specifications (4/97)

Article Created: 27 January 1995
Article Reviewed/updated: 9 April 1997

TOPIC -----

This article discusses the technical specifications of the Apple MessagePad 120.

DISCUSSION -----

Newton Intelligence

- Newton Recognition Architecture
 - Recognizes handwriting-printed, cursive, or a mixture of the two--with the assistance of a 13,000-word, built-in word list
 - Lets you add up to 1,000 words
 - Recognizes writing letter by letter or word by word
 - Allows deferred recognition: can store notes in handwritten form for later recognition
 - Includes three pop-up keyboards: typewriter, numeric, and phonepad
 - Recognizes graphics and symmetrical objects
- Newton Communications Architecture
 - Provides single interface for all communication services
 - Supports easy communications with minimum setup requirements
 - Supports new communications capabilities through its modular design
- Intelligent Assistance Architecture
 - Helps users complete repetitive tasks in multiple categories, including communications, scheduling, finding, and reminding functions.
 - Contains smart defaults to reduce complexity
 - Works in and between applications
 - Supports extensions by third-party developers

- Newton Hardware Architecture
 - ARM 610 RISC processor at 20 MHz
 - Apple custom system ASIC
 - Low-power, reflective LCD display (320 by 240 pixels)
3.8-in. by 2.8-in. (9.6 cm by 7.2 cm)
 - Telescoping pen and crisp, transparent tablet
 - 4MB of ROM, upgradable
 - 2MB of RAM version: 687K of system RAM; 1,361k of non-volatile user RAM
 - 1MB of RAM version: 639K of system RAM; 385k of non-volatile user RAM
 - One PCMCIA Type II card slot with 325 mA capacity
 - LocalTalk and RS-232-compatible serial port
 - Low-power, half-duplex, infrared transceiver works at up to 38.4 kbps within 3.28 feet (1 meter)
 - Protective removable lid

Communications Capabilities

=====

- Capable of communication with a variety of serial, parallel, and network printers
- Receive and store wireless messages using optional messaging card*
- Communicate by e-mail or tap into on-line information services with optional modem card
- Send notes, name card, and appointments at up to 38.4 kbps within 3.28 feet (1 meter) using high-speed "beaming" using infrared technology
- Handle telephone needs with assistance for intelligent auto dialing (DTMF or modem dialing)*
- Fax with optional fax/modem (automatic cover-page generation, post-formatting)
- Using built-in NewtonMail with optional modem, exchange electronic mail with other NewtonMail subscribers of on-line services

* Note: This service may not be available in all countries.

Size and Weight

=====

- Length: 8.0-in. (20.32 cm)
- Width: 4.0-in. (10.16 cm)
- Height: 1.2-in. (2.9 cm)
- Weight: 1.0-lb. (0.48kg) without batteries

Operating Environment

=====

- Temperature: 32 to 104 degrees F (0 to 40 degrees C)
- Storage temperature: -4 to 117 degrees F (-20 to 47 degrees C)
- Transit temperature: -4 to 149 degrees F (-20 to 65 degrees C) for up to 72 hours
- Relative humidity: 20% to 90% noncondensing

Power Requirements

=====

- Power adapter
 - Universal, 100 to 240 volts AC, 50/60 Hz
 - Four plug configurations: U.S., U.K., Europe, and Australia
- Battery Type: alkaline or NiCad Battery Pack
- Lithium cell: DL2032
 - Operating range: 3 volts (nominal)
- Built-in fast charger for optional NiCad Battery Pack
- Power sources: four AA batteries (included), optional Power Adapter, and optional Rechargeable NiCad Battery Pack

Computer Connectivity Requirements

=====

- Works with PC-compatible computers with 80386DX or better processors running Windows version 3.0 or later, using the Newton Connection Kit for Windows.
- Works with Macintosh computers with 68030 or better processors and system software version 7.1 or later, using the Newton Connection Kit for Macintosh

Printer Support

=====

- Built-in printer support for the Apple LaserWriter Plus (and other PostScript-equipped LaserWriter printers), the Personal LaserWriter LS, as well as the StyleWriter II printers
- Works with most popular PC printers including the Hewlett-Packard LaserJet II, DeskJet 500, Canon BubbleJet 10e, and Epson LQ and FX using the optional Newton Print Pack

Fax Machine Support

=====

- Supports Group 3 fax machines

Ordering Information

=====

Revised: 5/9/96
Security: Everyone

Apple MessagePad 120: Description (1/95)

=====

Article Created: 27 January 1995

TOPIC -----

The article provides a description of the Apple MessagePad 120.

DISCUSSION -----

Description
=====

The Apple MessagePad 120 puts easy-to-use communications, productivity, and desktop connectivity solutions in the palm of your hand so you can work away from your office.

Yet you'll find it far more useful than paper or electronic organizers because while it has a built-in notepad, to-do list, datebook, and address file for organizing personal and business affairs, with a modem it can also send faxes and gives you access to e-mail and on-line services.

The Apple MessagePad 120 can receive pages as well as electronic mail. And its built-in infrared communications allow you to instantly exchange information with other Newton devices.

The Apple MessagePad 120 lets you share and exchange information with either Windows-based or Macintosh computers.

Pen-based navigation and data entry make finding information easy and fast. And it allows you to capture and organize information in many forms: notes, sketches, schedules, lists, and letters. It also lets you enter information in many ways: digital ink, printed text, graphics, on-screen keyboard, or a combination.

The Apple MessagePad 120 has printing capabilities that make it simple to print your information the way it appears on its crisp, easy-to-read screen, or as full-page formatted letters.

Its built-in recognition software can even transform your written handwriting into typed text letter by letter or word by word.

But best of all-unlike paper and electronic organizers-your Apple MessagePad 120 can be expanded with software titles as well as accessories and on-line services that can keep you organized, efficient, and very well informed.

Features

=====

- Built-in functions
 - Calendar helps you plan monthly, weekly, and daily activities
 - To-do list helps you manage and prioritize your tasks
 - Includes name and address files for colleagues and friends using a familiar business-card format
 - Actively assists you in making phone calls, faxing, finding information, sending electronic mail, printing, scheduling meetings, and completing to-do lists
 - Offers an assortment of information and productivity tools such as time-zone maps, a calculator, currency exchange formulas, and measurement conversions
 - Allows free-form note taking
 - Can turn printed or cursive handwriting into typed text
 - Lets you beam notes, messages, schedules, or business cards using a built-in infrared communication capability
 - Can use a wired or wireless modem to send faxes or use built-in NewtonMail software to tap into electronic mail and on-line services
 - Using the optional Newton Connection Kit, lets you share information and back up and synchronize files with Windows-based or Macintosh computers
 - Prints formatted letters and notes directly using Apple printers or serial or parallel printers using the optional print pack
 - Maintains your business and personal information safely and securely even when your batteries are fully discharged
- Expandable functions
 - Offers a large selection of productivity, finance, time, billing, management, reference, and entertainment software
 - Lets you receive wireless paging messages with an optional messaging card
 - Works with a large selection of PCMCIA cards and external serial peripherals-modems, pagers, and wireless communications and storage products

PowerBooks: Scrolling Speed - Color vs Black & White (1/95)

Revised: 1/27/95
Security: Everyone

PowerBooks: Scrolling Speed - Color vs Black & White (1/95)

=====

Article Created: 27 January 1995

TOPIC -----

I have a PowerBook 170 which I want to replace with a PowerBook 280c. However, I cannot understand why the text scrolling in Microsoft Word 5.1 on the PowerBook 280c seems slower than on my PowerBook 170. On the other hand, I found that the performance of Microsoft Excel is faster on the PowerBook 280c than on my PowerBook 170.

I understand that the PowerBook 170 and the PowerBook 280c are each running at different processor speeds and operating on different system software, but could you provide a technical answer describing why the scrolling on PowerBook 280c seems slower?

DISCUSSION -----

The reason why scrolling may appear faster on a PowerBook 170 is due to the color, or lack thereof. A PowerBook 170 can only display black and white, so a pixel on the screen of a 170 is represented by 1 bit. A PowerBook 280c can display 256 colors, so a pixel on the screen of a PowerBook 280c is represented by 8 bits (16 bits in thousands of colors). This means that QuickDraw has to keep track of that much more information when scrolling which makes it slower.

A better comparison in performance would be to set the PowerBook 280c (or any PowerBook whose screen is set to display grays or colors) to black and white using the Monitors control panel, and then compare application performance. This will give you a truer comparison of the actual processing speed of each machine.

PowerBook: Wake on Ring Explanation (2/96)

=====

Article Created: 30 January 1995
Article Reviewed/Updated: 14 February 1996

TOPIC -----

What exactly is the Wake on Ring feature of my PowerBook and how do I use it?

DISCUSSION -----

The Wake on Ring feature is designed to wake the computer from sleep when a phone call is received by the internal modem. After the computer wakes up via this feature, it will not go to sleep again automatically. When a modem is set to receive a fax, the computer will not sleep because the serial port is busy monitoring for an incoming phone call.

All of the PowerBook 100 series computers (except the 150 and 190) support the Wake on Ring feature. This includes the PowerBook 100, 140, 145, 145B, 160, 165, 165c, 170, 180, and 180c.

All other PowerBook computer models (including the 150 and 190) do not have this same "Wake on Ring" feature. Instead they have a "Wake-up At" feature which wakes the computer from sleep at a specified time rather than when the phone rings.

Article Change History:
14 Feb 1997 - Reworded for clarity.
10 Feb 1997 - Added PowerBook 1400 series.
02 Jan 1996 - Added PowerBook 150, 190, and 5300 series information.

PowerBook: Hard Drive Spins Up After Spin Down Command (4/95)

Revised: 4/3/95
Security: Everyone

PowerBook: Hard Drive Spins Up After Spin Down Command (4/95)

Article Created: 30 January 1995
Article Reviewed/Updated: 03 April 1995

TOPIC -----

When I use the Control Strip on my PowerBook to "Spin Down Internal Hard Disk," my hard drive will spin up after a minute or so. Why does it spin up when I'm not actually saving or accessing the hard drive at the time?

DISCUSSION -----

There are two types of files that may cause this to happen.

1. If you are running any applications that automatically update a file or monitor activity, the hard drive may spin up to either read or save. Such programs include anti-virus, backup, spell checkers, and compression software.

The application may also need to load in resources which were not loaded when it launched. The same could hold true for system software resources that become needed after the drive spins down.

2. Some Extensions and Control Panels may cause the hard drive to spin up. When running on battery power, use the Extensions Manager to turn off as many Extensions and Control Panels as possible. This may help to eliminate spurious background activity.

Article Change History:
03 Apr 1995 - Additional reasons for spin up documented.

Apple MessagePad: System Update 1.3 Versions and Changes (1/97)

Revised: 1/17/97
Security: Everyone

Apple MessagePad: System Update 1.3 Versions and Changes (1/97)

=====

Article Created: 30 January 1995
Article Reviewed/Updated: 17 January 1997

TOPIC -----

There are a couple of different versions of the Newton System Update 1.3 available. Which version should I use?

DISCUSSION -----

Apple MessagePad 100
=====

If you have an Apple MessagePad 100, install System Update 1.3 (414313). This version installs over the earlier MessagePad 100 System Update version 1.3 (414059).

Apple MessagePad 110
=====

If you have an Apple MessagePad 110, install System Update 1.3 (345025). This version installs over the following earlier MessagePad 110 System Updates:

- Version 1.3 (344311)
- Version 1.3 (344052)
- Version 1.3 (344138)
- Version 1.2.0

System Update 1.3 Changes
=====

The Newton software no longer closes Notification Windows (such as alarms) when it goes to sleep, preventing you from missing notifications you receive when the Newton is left unattended.

You can now use the * (asterisk) and # (pound) characters when dialing phone numbers from the call slip. For example, you can set the dialing prefix to *70 to turn off call waiting if your phone system permits it.

A recognition problem, which could cause the accuracy of the MessagePad's handwriting recognition to gradually degrade for some users, was corrected. If you switch to guest mode then switch back to owner's mode, the MessagePad now restores the preferred Letter Styles settings when the writing style is set to Printed Only.

If the location is set to a city in Japan and you attempt to dial while using a modem, the Newton sends the correct modem initialization string: AT%J&P1. A problem that could require you to perform a soft reset before your Apple MessagePad would recognize PCMCIA cards was corrected.

The contents of flash PCMCIA memory cards are erased more reliably.

Availability =====

System Update 1.3 is available through the following methods:

- Newton System Update 1.3 available online
- Newton Bulletin Board Service
- U.S. Mail service

Online -----

America Online - keyword: applecomputer

CompuServe - GO APLSUP

Internet -
Worldwide Web: <<http://www.info.apple.com/swupdates>>
ftp: <<ftp://ftp.info.apple.com>>

Newton Bulletin Board Service -----

You can receive the Newton System 1.3 Update by calling the special Newton Bulletin Board Service and following these steps:

Step 1:
Connect your Newton to your Newton Modem.

Step 2:
Connect your modem to a standard phone line.

Step 3:
Tap Extras.

Step 4:
Tap In Box.

Step 5:

Tap Receive

Step 6:

Tap Enhancement

Step 7:

Enter 9, if needed, to reach an outside phone line, then enter:
1-800-NEWTON9 (639-8669).

Step 8:

Tap Call. Your Newton automatically receives the system update.

Step 9:

Tap the Restart button on the screen to complete the installation.

You can verify the new version number by tapping on Extras, then tapping on Prefs. At the bottom of the window the Apple MessagePad 100 should display 1.3 (414313); the Apple MessagePad 110 should display 1.3 (344311).

U.S. Mail Service

You can receive the Newton System 1.3 Update by calling the Apple Order Center at (800) 315-2246 and requesting the update.

IMPORTANT: There is a shipping and handling charge for the update if it is sent by mail.

These articles can help you locate software updates mentioned here:

- Where To Find Apple Software Updates
Lists online services for "free" Apple software updates
- Obtaining Apple Product Support in the USA
Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library

Article Change History:

17 Jan 1997 - Updated online references.
25 Sep 1995 - Added additional system version to MessagePad 110.
06 Mar 1995 - Added keyword; minor technical updates and clarifications.
06 Feb 1995 - Corrected MessagePad 110 System Update version number.

LaserWriter 16/600 PS: Disable NetWare If Not Needed (1/95)

Revised: 1/30/95
Security: Everyone

LaserWriter 16/600 PS: Disable NetWare If Not Needed (1/95)

=====

Article Created: 30 January 1995

TOPIC -----

If you are connected to a Novell network, and do not properly configure the LaserWriter 16/600 PS for Netware an IPX bindery request is broadcast every 30 seconds.

DISCUSSION -----

In order to prevent the bindery request, configure the printer for Netware or disable IPX using the Apple Printer Utility.

Disabling Netware

- 1) Place the Configuration switch in the UP position
- 2) Launch the Apple Printer Utility
- 3) Use Custom Switch option
- 3) Select Ethernet Port, NetWare, Mode, Off.

PlainTalk: Additional Files Installed Description (2/95)

=====

Article Created: 30 January 1995
Article Reviewed/Updated: 16 February 1995

TOPIC -----

After installing System 7.5 from my Upgrade CD, I noticed the following files were also installed in my Extensions folder; InlineFilter, CEToolbox, and QuicKeys.

What are these files?

DISCUSSION -----

These four files are installed when PlainTalk is installed. A description of each follows:

InlineFilter - Provides in line text editing for non arabic languages such as Kanji or Chinese. It is related to AppleScript.

CEToolbox - Is used by CE Software's QuicKeys.

QuicKeys - A keyboard macro utility.

VideoSync: Not Supported on Power Macintosh (3/95)

Revised: 3/28/95
Security: Everyone

VideoSync: Not Supported on Power Macintosh (3/95)

=====

Article Created: 30 January 1995
Article Reviewed/Updated: 28 March 1995

TOPIC -----

I have a Power Macintosh 6100AV and I want to tape the output of the screen. VideoSync is available for this purpose, but I cannot get it to work on the Power Macintosh 6100AV. Is there a newer version of this utility that works on the Power Macintosh AV computers?

DISCUSSION -----

There is no officially supported solution available for using VideoSync with a Power Macintosh AV system. But, there is a workaround that you may want to use.

You could use a third-party sense code adapter, such as the MacLiberty Adapter from Enhance Cable Technology. This adapter has an adjustable dial allowing it to send the Macintosh video card the correct sense codes for a variety of different screen configurations.

By selecting the appropriate setting for VGA or SVGA, a Power Macintosh AV system makes two video modes available, which will display at a 60 Hz scan rate. These video modes are the VGA resolution of 640x480, and the SVGA (also sometimes called VESA) resolution of 1024x768. These modes can be selected by clicking on the "Options" button in the Monitors control panel.

Because these video modes use a 60 Hz scan rate, these resolutions are suitable for filming and video taping. This enables you to use a sense code adapter as an alternative to the VideoSync software. Be aware that 60 Hz is definitely not suited for filming and that 60 Hz will create a visible, though slight, roll to the picture.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Article Change History:

28 Mar 1995 - Changed information on 60 Hz filming and taping.

03 Mar 1995 - Added information on using VGA and SVGA modes.

Using A Macintosh While Placed On Its Side (9/95)

Revised: 9/29/95
Security: Everyone

Using A Macintosh While Placed On Its Side (9/95)

=====

Article Created: 30 January 1995
Article Reviewed/Updated: 29 September 1995

TOPIC -----

I would like to position my Macintosh on its side. Will this cause a problem if I do this? I think as long as the air vents are not blocked and there is plenty of air flow, this would be OK. Also would there be some kind of mechanical problem, like the hard drive needing to be upright in order to spin properly?

DISCUSSION -----

Using a Macintosh on its side is not supported by Apple Computer. Thermal testing and safety testing were done with the unit in its intended position. Any variation on the intended use of the product is not supported.

If a customer decides to operate the unit on its side they would have to allow spacing for air flow from the fan(s) located inside of the case.

If the unit has an internal CD-ROM drive, it probably would not work because of the tray loading of CD discs. There would be no way of holding the CD in position when the tray moves back into the CD-ROM drive.

The operation of the hard drive assembly should not be affected by the change in orientation of the Macintosh.

Article Change History:
29 Sep 1995 - Made article more Macintosh generic.

System 7.5, Adjustable Keyboard, and Key Caps (1/95)

Revised: 1/31/95
Security: Everyone

System 7.5, Adjustable Keyboard, and Key Caps (1/95)

=====

Article Created: 31 January 1995

TOPIC -----

Using Key Caps in System 7.5 with an Adjustable Keyboard, I only see the keypad, not the keyboard. Does the original software for this keyboard need to be installed?

DISCUSSION -----

No, the software for the Adjustable Keyboard was included in the System Update 3.0, which in turn is in System 7.5. The Installer for the Adjustable Keyboard software will put up a warning dialog box indicating that newer software already exists. The solution is to press a key on the keyboard and Key Caps will switch its display to it. In other words, if Key Caps brings up the keypad, press a key on the keyboard and it will then display it, and vice versa.

Global Village Fax: Using Shortcuts Make Faxing Easier (1/95)

Revised: 1/31/95
Security: Everyone

Global Village Fax: Using Shortcuts Make Faxing Easier (1/95)

=====

Article Created: 31 January 1995

TOPIC -----

Each time I want to send a fax with my PowerBook 540c and Global Village Mercury modem, I have to open the Chooser and select Global Fax. Then when I want to print, I have to again open the Chooser and select my printer. Is there an easier way to do this?

DISCUSSION -----

When you make a selection between either Global Fax, or printer in the Chooser then close it, you save that setting as your default printer. By using this method you are changing the Default Printer every time.

An easier way would be to select your printer in the Chooser as the default printer. When you want to send a fax, first press and hold the Option key, then from the File menu select Print or Fax (Fax will appear if the application you are using supports this feature). After you have finished sending your fax, system software will automatically switch back to your default printer.

The Option key can also be changed to the Command key in the Chooser by selecting Global Fax and hitting the radio button Shortcut.

Global Village: GlobalFax 2.5 Software Upgrade (3/95)

Revised: 3/23/95
Security: Everyone

Global Village: GlobalFax 2.5 Software Upgrade (3/95)

Article Created: 31 January 1995
Article Reviewed/Updated: 23 March 1995

TOPIC -----

Global Village has upgraded their GlobalFax software to version 2.5. This upgrade includes many bug fixes, and also provides better support for System 7.5 and QuickDraw GX.

DISCUSSION -----

GlobalFax 2.5 began shipping with Global Village TelePort and PowerPort modems, and OneWorld Fax and OneWorld Combo servers in January 1995. GlobalFax 2.5 software was rolled into bundles that contain Global Village modems in February, 1995 for PowerBook, and is scheduled for March, 1995 for Performa computers. For current GlobalFax users, special low-cost upgrades are available directly through Global Village at 800-736-4821 (select menu option #2). GlobalFax 2.5 Upgrades are priced at \$24.95. GlobalFax Cover Sheets are available separately for \$24.95.

NOTE: The GlobalFax 2.5 software update is NOT available from Apple Computer; it is available only from Global Village.

The GlobalFax 2.5 upgrade for TelePort serial modems replaces the Performa Receive upgrade previously offered by Global Village. With the new software, owners of Global Village TelePort Bronze for Performa fax modems can now add the original receiving, group address lists, and scheduling capabilities of Performa Receive along with all the new features of GlobalFax 2.5 for one-half the price of the original.

Article Change History:
23 Mar 1995 - Made minor technical updates.
01 Feb 1995 - Changed a small piece of information for clarity.

DOS Compatibility Card: Printing is Slow in MS-DOS (3/95)

Revised: 5/24/95
Security: Everyone

DOS Compatibility Card: Printing is Slow in MS-DOS (3/95)

=====

Article Created: 1 February 1995
Article Reviewed/Updated: 1 March 1995

TOPIC -----

I have the DOS Compatibility Card for the Power Macintosh 6100 connected using Ethernet to a LaserWriter Pro 630. When I am printing from within any Windows applications, it prints without any problems. However, when I use MS-DOS applications, specifically FoxPro, it is extremely slow printing. It can take up to 10 minutes for something I send to the printer to start printing. I have changed settings in the Macintosh PC Spooler application from PCL to Epson emulation, but that has not increased the printing speed.

I am also concerned about the typeface used when printing from MS-DOS applications. The font looks like Geneva, and I need the font to be in a mono-spaced font like courier. How can I change this?

DISCUSSION -----

There are two possible solutions to increase the speed; connect the LaserWriter Pro 630 directly to the DOS Compatibility Card using a custom serial cable, or print from MS-DOS using a utility from LaserTools. Printing from MS-DOS to the LaserWriter Pro 630 over a network can be extremely slow.

Hardware Configuration
=====

In order to print to a LaserWriter 630 connected to the DOS Compatibility Card, a serial cable like the one below needs to be built.

Cable Pinouts No Handshaking

.	DB9	Din-8
(LaserWriter Pro 630)		(Macintosh)

```
-----
.   DCD 1----|
.   DTR 4----|-----1 HSKo (DTR)
.   RTS 7----|-----2 HSKi (CTS)
.   CTS 8----|
.   TxD 3-----5 RxD-
.   RxD 2-----3 TxD-
.   SIG GND 5-----|----4 SIG GND
.                   |----7 GPi
.   DSR 6 - No Connection
.   RI  9 - No Connection
```

This cable is a straight through connection without handshaking. Pins 1,4,7, and 8 on the DB9 are connected to pins 1 and 2 on the Din-8. Pin 5 on the DB9 is connected to both pins 4 and 7 on the Din-8. On this cable everything is grounded except for transmit and receive. The HSKo and HSKi on the Macintosh are not used, so a more straight forward cable like the one below can be used instead.

Alternate Cable Pinouts

```
-----
.           DB9                      Din-8
.           ---                      -----
DCD         1 No Connection           1 HSKo (DTR) No Connection
DTR         4 No Connection           2 HSKi (CTS) No Connection
RTS         7 No Connection
CTS         8 No Connection
TxD         3-----5 RxD-
RxD         2-----3 TxD-
SIG GND     5 No Connection           4 SIG GND No Connection
DSR         6 No Connection           7 GPi No Connection
RI          9 No Connection
```

Both of these cables work in Windows and MS-DOS. You can use these cables in Windows at either 19,200 or 9600 baud. However, you can only use 9600 baud when you are using MS-DOS.

Software Configuration

=====

Once the LaserWriter Pro 630 is connected to the Macintosh, you need to configure the printer port in the Macintosh OS as: COM1 for MS-DOS and Windows. Here is how to configure the printer port.

Mac Control Panel PC Setup

- 1) Open the PC Setup control panel
- 2) Change the Mapping for COM1 to Printer Port.

Note:

If you prefer you can use COM2 instead of COM1.

- 3) Click the Restart PC button
- 4) A dialog appears. Click OK to confirm you want to continue.
- 5) Close the PC Setup control panel

Printing From Windows

- 1) In Windows, double-click the Main Group icon
- 2) Double-click the Control Panels icon
- 3) Double-click the Printers icon
- 4) Install the appropriate driver for the LaserWriter Pro 630 printer. The printer drivers for Windows are provided with the LaserWriter Pro 630.

Note:

Consult the Windows or LaserWriter Pro 630 manual for driver installation.

- 5) After driver installation, click the "Connect" button in the Printers Control Panel.
- 6) Select the appropriate COM port, click the check box marked "Fast Printing Direct to Port"
- 7) Click the "Settings" button
- 8) Set the COM port parameters to:

- . Baud Rate: 19200
- . Data Bits: 8
- . Parity: None
- . Stop Bits: 1
- . Flow Control: Xon/Xoff

- 9) Click either "Set As Default Printer" or "Close" and Windows is setup to print to a DOS serial printer without having to go through emulation.

Printing in MS-DOS Using Printer Control Panel

=====

The best option printing in MS-DOS is to use a printer mode switching utility from LaserTools. The Printer Control Panel software was licensed and originally included in specific LaserWriters for Windows products. In LaserWriter printers not specifically marketed as Windows printers, this software was not included. If your LaserWriter Pro 630 did not come with the Printer Control Panel

software, you need to purchase a copy of it.

The product is a TSR (terminate and stay resident) called Printer Control Panel and works for both DOS and Windows environments. It supports the LaserWriter Pro 600 and 630, Personal LaserWriter NTR, and the LaserWriter Select 310.

The product checks all print jobs from the PC and downloads the appropriate emulation switching PostScript commands to the printer. Thus, the "automatic" emulation switching takes place at the PC-level and not at the LaserWriter, since the LaserWriter cannot automatically sense the type of jobs coming in.

Article Change History:

01 Mar 1995 - Corrected some of the pinout lables.

LaserWriter 16/600 PS: Setting the IP Address from Bootp (2/95)

Revised: 2/1/95
Security: Everyone

LaserWriter 16/600 PS: Setting the IP Address from Bootp (2/95)

Article Created: 1 February 1995

TOPIC -----

On the LaserWriter 16/600 PS printer an incorrect IP address (0.0.0.0) is printed on the start-up page. The printer can be printed too, and pinged but the IP address cannot be extracted with bootp (in one situation, the Ethernet hardware address from another device was being associated with the IP address of the LaserWriter). The only way to set the IP address was manually.

DISCUSSION -----

The following is a list of the configuration files that used to set up the IP addressing through BootP to the Laserwriter 16/600.

#Make sure the IP address is the same in the "/etc/hosts" file and the the #BootP server configuration file

```
grep printtest /etc/hosts
130.43.4.210    printtest
```

#Set up the BootP server configuration file

```
%more /etc/bootptab
```

```
test:\
    bf=bp.conf:\
    hd=/etc:\
    hn:\
    ht=ether:\
    vm=rfc1048:\
    ha=1000E02B4531:\
    lp=130.43.4.210:\
    gw=130.43.4.0:\
```

```
#Set up a configuration file with the printer's Ethernet MAC address
# and the intended Ip address:
```

```
%more /etc/bp.conf
# printer_name      ethernet_address      IP_address
  testprint         10:00:e0:2b:45:31      130.43.4.210
```

```
#To see whether BootP server takes its configuration file or not
%tail /usr/adm/syslog
```

```
Jan 25 15:42:31 hp715 bootpd[1341]: reading "/etc/bootptab"
Jan 25 15:42:31 hp715 bootpd[1341]: read 1 entries from "/etc/bootptab"
Jan 25 15:53:24 hp715 bootpd[1374]: bootpd 2.1 #1.16.193.3: Wed Jul 7

Apple MessagePad: System Update 1.3 Read Me File (2/95)

Revised: 2/6/95
Security: Everyone

Apple MessagePad: System Update 1.3 Read Me File (2/95)

=====

Article Created: 1 February 1995
Article Reviewed/Updated: 6 February 1995

TOPIC -----

This article contains the Read Me file for the Apple MessagePad System Update 1.3.

DISCUSSION -----

Newton System Update 1.3 for MessagePad 100 and MessagePad 110

=====

This document describes the feature enhancements of System Update 1.3 for the MessagePad 100 and the MessagePad 110, along with installation instructions. This System Update 1.3 is for all MessagePad 100 and MessagePad 110 owners in the United States and Australia.

Changes in This System Update:

=====

- Alarm windows are no longer closed when the Newton goes to sleep. This will prevent you from missing notifications that occur when your Newton is unattended.
- A recognition problem was corrected that may have caused accuracy of handwriting recognition to gradually degrade for some users.
- PCMCIA cards can now be recognized without a soft reset.
- You can use the '*' and '#' characters when dialing phone numbers while in the call slip. (For example, you can set the dialing prefix to '*70' to turn off call waiting if your phone system allows it.)
- If your handwriting style is set to "Printed Only" in Prefs, when you

switch to guest mode, then back again, your letter styles settings are restored.

- The PackageMover application is included to install the system update.

CHANGES TO THE MESSAGEPAD 100 SYSTEM SOFTWARE ONLY:

- When you have more than 30 items visible in the Extras Drawer, icons are displayed properly.
- The current date is at the top of all Calendar and To Do printouts and faxes.

CHANGES TO THE MESSAGEPAD 110 SYSTEM SOFTWARE ONLY:

- You can now dial a number using a modem if your location is set to a city in Japan.
- The reliability of erasing flash PCMCIA card memory has been improved.

Installing the System UPDATE 1.3

=====

- If you have a Newton MessagePad 100, install System Update 1.3 (414313). This version will install over the earlier MessagePad 100 System Update version 1.3 (414059).
- If you have a Newton MessagePad 110, install System Update 1.3 (345025). This version will install over the following earlier MessagePad 110 System Updates:
 - version 1.3 (344052)
 - version 1.3 (344138)
 - version 1.2.0

If you need to determine the system software version your MessagePad has:

- 1) Tap Extras to open the Extras Drawer.
- 2) Tap Prefs.

The system software version number is at the bottom of the screen.

Notes:

- Installing this system update will not affect your handwriting recognition and will not erase any information currently stored on your MessagePad.
- The Newton System Update 1.3 will not damage your MessagePad 110 if you have already installed it, and install it again, or if you install it on an original MessagePad or MessagePad 100.

If you have any questions about installing the System Update 1.3, contact the Apple Assistance Center at (800) SOS-APPL (767-2775).

If you have the Newton Connection Kit 2.0 for Macintosh or the Newton Connection Kit 2.0 for Windows, follow the instructions in "Using the Newton Connection Kit

2.0". If you have a Macintosh or a PC and a serial cable, follow the instructions in "Using a Serial Cable".

Using the Newton Connection Kit 2.0

=====

To install this update, you need the following:

- The System Update 1.3 for the MP100 and MP110 for Macintosh or the System Update 1.3 for the MP 100 and MP110 for Windows disk
- The Newton Connection Kit 2.0 for Macintosh or the Newton Connection Kit 2.0 for Windows
- One of the following:
 - a Macintosh computer with a 68030 processor or better, running system software version 7.1 or later
 - a PC-compatible computer with a 80386DX processor or better, running Windows 3.0 or later

If you have a Macintosh computer, see "Macintosh Users." If you have a PC running Windows, see "Windows Users."

Macintosh users

IMPORTANT: You should synchronize your MessagePad with the Newton Connection Kit or back up to a storage card (PCMCIA card) before you install this system update.

Follow these steps to transfer information:

1) Connect your MessagePad to your Macintosh.

Use the cable that came with your Newton Connection Kit. (It has mini DIN-8 connectors on both ends.) For more information, see the Newton Connection Kit 2.0 for Macintosh User's Guide.

2) Turn your MessagePad and your Macintosh on.

3) Insert the System Update 1.3 for MP 100 and MP110 for Macintosh disk into your Macintosh.

4) On your computer, double-click the disk icon to open it.

5) Click the PackageMover.pkg and drag it to the Newton Package Installer. The Newton Package Installer opens.

6) In the window that appears, select the type of connection you made, and click OK.

7) On your MessagePad, tap Extras to open the Extras Drawer, then tap Connection.

- 8) Select the kind of connection you made in the list of options.
The Newton Package Installer then installs the PackageMover.pkg.
- 9) On your computer:
 - If you have a Messagepad 100, drag the MP100 1.3(414313).pkg file to the Newton Package Installer.
 - If you have a MessagePad 110, drag the MP110 1.3(345025).pkg file to the Newton Package Installer.
- 10) In the window that appears, select the type of connection you made, and click OK.
- 11) On your MessagePad tap Extras to open the Extras Drawer, then tap Connection.
- 12) Select the kind of connection you made in the list of options.
The selected System Update 1.3 file is installed on your MessagePad.
A message appears saying "New system software has been installed.
Please tap Restart".
- 13) Tap Restart.
- 14) On your MessagePad, tap Extras to open the Extras Drawer.
- 15) Tap Prefs.
The version number at the bottom of the screen should be 1.3 (414313) if you installed the software successfully on a MessagePad 100, or 1.3 (345025) if you installed the software successfully on a MessagePad 110.

Windows users
=====

IMPORTANT: You should synchronize your MessagePad with the Newton Connection Kit or back up to a storage card (PCMCIA card) before you install this system update.

Follow these steps to transfer information:

- 1) Connect your MessagePad to your PC.
Use the cable that came with your Newton Connection Kit. (a 9-pin serial connector at one end and a mini DIN-8 connector at the other.)
If you have a 25-pin serial port, use the adapter that came with your Newton Connection Kit. For more information, see the Newton Connection Kit 2.0 for Windows User's Guide.
- 2) Turn your PC and MessagePad on.
- 3) Insert the System Update 1.3 for MP 100 and MP110 for Windows disk into your PC.

- 4) On your PC, double-click the File Manager icon to open it, and select the A or B drive, depending on which drive the disk is in.
- 5) Double-click the NEWTINST.EXE icon. The Newton Package Installer opens.

Note: Follow steps 6-9 exactly as stated. You must always select Install Package on your PC first, before tapping Connection on your MessagePad.

- 6) From the File menu, choose Install Package.
- 7) Select PCKGEMVR.PKG to install, and click OK.
- 8) On your MessagePad, tap Extras to open the Extras Drawer, then tap Connection.
- 9) Tap DOS or Windows PC in the list of options, then tap Connect. PCKGEMVR.PKG is installed on your MessagePad.
- 10) From the File menu, choose Install Package.
- 11) Select a System Update 1.3 file to install, and click OK.
 - If you have a MessagePad 100, select the MP100.pkg file.
 - If you have a MessagePad 110, select the MP110.pkg file.
- 12) On your MessagePad, tap Extras to open the Extras Drawer, then tap Connection.
- 13) Tap DOS or Windows PC in the list of options, then tap Connect. The selected System Update 1.3 file is installed on your MessagePad. A message appears saying "New system software has been installed. Please tap Restart".
- 14) Tap Restart.
- 15) On your MessagePad, tap Extras to open the Extras Drawer.
- 16) Tap Prefs. The version number at the bottom of the screen should be 1.3 (414313) if you installed the software successfully on a MessagePad 100, or 1.3 (345025) if you installed the software successfully on a MessagePad 110.

USING A SERIAL CABLE =====

To install this update, you need the following:

- the System Update 1.3 for MP 100 and MP110 for Macintosh or for Windows disk
- One of the following:

- a Macintosh computer with a 68030 processor or better, running system software version 7.1 or later, and a serial cable (mini DIN-8 connectors on both ends.)
- a PC-compatible computer with a 80386DX processor or better, running Windows 3.0 or later, and serial cable (a 9-pin serial connector at one end and a mini DIN-8 connector at the other, if you have a 25-pin serial port, use an adapter).

If you have a Macintosh computer, see "Macintosh Users." If you have a PC running Windows, see "Windows Users."

Macintosh users

IMPORTANT: You should synchronize your MessagePad with the Newton Connection Kit or back up to a storage card (PCMCIA card) before you install this system update.

Follow these steps to transfer information:

- 1) Connect your MessagePad to your Macintosh.
Plug one end of a serial cable (mini DIN-8 to mini DIN-8) into the communication port on your MessagePad and plug the other end into the printer or modem port on your Macintosh.
- 2) Turn your Macintosh and MessagePad on.
- 3) Insert the System Update 1.3 for MP 100 and MP110 for Macintosh disk into your Macintosh.
- 4) On your computer:
 - If you have a MessagePad 100, double-click the System Update 1.3 for MP 100 for Macintosh disk icon to open it.
 - If you have a MessagePad 110, double-click the System Update 1.3 for MP110 for Macintosh disk icon to open it.
- 5) Drag the Apple Modem Tool icon to your System Folder.
A message appears telling you that the file will be placed in the Extensions folder.
- 6) Click OK.
Apple Modem Tool is placed in the Extensions Folder within your System Folder.
- 7) Click on PackageMover.pkg and drag it to Newton Package Installer.
The Newton Package Installer opens.
- 8) In the window that appears, select the serial connection you made, and click OK.
- 9) On your MessagePad, tap Extras to open the Extras Drawer, then tap Connection.

- 10) Select the kind of connection you made in the list of options.
The Newton Package Installer then installs the PackageMover.pkg from the disk.
- 11) On your computer, select a System Update 1.3 file to install, and drag it to Newton Package Installer.
 - If you have a MessagePad 100, select the MP100 1.3(414313).pkg file.
 - If you have a MessagePad 110, select the MP110 1.3(345025).pkg file.
- 12) In the window that appears, select the type of connection you made, and click OK.
- 11) On your MessagePad, tap Extras to open the Extras Drawer, then tap Connection.
- 12) Select the kind of connection you made in the list of options.
The selected System Update 1.3 file is installed on your MessagePad. A message appears saying "New system software has been installed. Please tap Restart".
- 14 Tap Restart.
- 15 On your MessagePad, tap Extras to open the Extras Drawer.
- 16 Tap Prefs. The version number at the bottom of the screen should be 1.3 (414313) if you installed the software successfully on a MessagePad 100, or 1.3 (345025) if you installed the software successfully on a MessagePad 110.

Windows users

IMPORTANT: You should synchronize your MessagePad with the Newton Connection Kit or back up to a storage card (PCMCIA card) before you install this system update.

Follow these steps to transfer information:

- 1) Connect your MessagePad to your PC.
Use a cable that has a 9-pin serial connector at one end and a mini DIN-8 connector at the other. (If you have a 25-pin serial port, use a 9-pin to 25-pin adapter, along with the above cable.) Choose an available serial port on your PC and connect the end of the cable with 9 holes to the appropriate port. Plug the other end of the cable into the MessagePad's communication port.
- 2) Turn your PC and your MessagePad on.
- 3) Insert the System Update 1.3 for MP 100 and MP110 for Windows disk into your PC.
- 4) On your PC, double-click the File Manager icon to open it, and select

the A or B drive, depending on which drive the disk is in.

- 5) Double-click the NEWTINST.EXE icon.
The Newton Package Installer opens.

Note: Follow steps 6-9 exactly as stated. You must always select
Install Package on your PC first, before tapping Connection on
your MessagePad.

- 6) From the File menu, choose Install Package.
- 7) Select PCKGEMVR.PKG to install, and click OK.
- 8) On your MessagePad, tap Extras to open the Extras Drawer, then tap
Connection.
- 9) Tap DOS or Windows PC in the list of options, then tap Connect.
PCKGEMVR.PKG is installed on your MessagePad.
- 10) From the File menu, choose Install Package.
- 11) Select a System Update 1.3 file to install, and click OK.
 - If you have a MessagePad 100, select the MP100.pkg file.
 - If you have a MessagePad 110, select the MP110.pkg file.
- 12) On your MessagePad, tap Extras to open the Extras Drawer, then tap
Connection.
- 13) Tap DOS or Windows PC in the list of options, then tap Connect.
The selected System Update 1.3 file is installed on your MessagePad.
A message appears saying "New system software has been installed.
Please tap Restart".
- 14) Tap Restart.
- 15) On your MessagePad, tap Extras to open the Extras Drawer.
- 16) Tap Prefs. The version number at the bottom of the screen should
be 1.3 (414313) if you installed the software successfully on a
MessagePad 100, or 1.3 (345025) if you installed the software
successfully on a MessagePad 110.

Article Change History:

06 Feb 1995 - Corrected version number for the MessagePad 110.

Security Lock Ports on Apple Displays (2/95)

Revised: 2/1/95
Security: Everyone

Security Lock Ports on Apple Displays (2/95)

Article Created: 1 February 1995

TOPIC -----

What type of security lock ports do the Apple displays have and where are they located?

DISCUSSION -----

Security lock ports are used to physically lock Apple displays to a desk or other stationary object using some kind of cable locking system.

Apple generally uses four different types of security lock ports on their hardware products. They are as follows:

PORT TYPE	DESCRIPTION
Large rectangular port	This security port is a rectangular port that measures approximately 6mm x 35mm at the opening.
Small rectangular port	This is a slightly smaller rectangular port. It measures approximately 6mm x 22mm at the opening.
1/4" Mini-slot port	This is the most recent security lock port. This port is a small, 3mm x 7mm, opening without latches of any kind. It uses a different type of security device than the previous security lock ports.
Cable Slotted port	This is a plastic loop on the bottom of the unit that is intended to have a security cable fed through it.

Use the following chart to determine which type of security device you need for your Apple display.

NOTE Generally, security lock ports are located on the back panels of most Apple displays or, in the case of the cable slotted port, on the bottom panels.

PRODUCT DESCRIPTION -----	PORT TYPE -----	LOCATION (View From Rear) -----
12-Inch Monochrome	Small rectangular port	Lower Left Corner
12-Inch RGB	Small rectangular port	Lower Left Corner
Performa Display	No Security	No Security
Performa Plus Display	No Security	No Security
Hi-Resolution Monochrome	Small rectangular port	Between power & video
Hi-Resolution RGB	Small rectangular port	Between power & video
Macintosh Color Display	Cable slotted port	Security On Base
Portrait Display	Small rectangular port	Lower Right Corner
16-Inch Color	Small rectangular port	Lower Left Corner
Two-Page Monochrome	Small rectangular port	Lower Left Corner
21-Inch Color	Small rectangular port	Lower Left Corner
Apple Basic Color	No Security	No Security
AudioVision 14-Inch	Cable slotted port	Security On Base
Apple Color Plus	No Security	No Security
Multiple Scan 15-Inch	Cable slotted port	Right Side-Middle
Multiple Scan 17-Inch	Small rectangular port	Lower Left Corner
Multiple Scan 20-Inch	Cable slotted port	Security On Base

Apple Mobile Messaging System: Description (7/95)

Revised: 7/6/95
Security: Everyone

Apple Mobile Messaging System: Description (7/95)

=====

Article Created: 1 February 1995
Article Reviewed/Updated: 06 Jul 1995

TOPIC -----

This article provides an overview of the Apple Mobile Message System.

DISCUSSION -----

Overview

=====

The Apple Mobile Message System is an easy-to-use wireless messaging system that lets users of Apple PowerBook computers, Apple MessagePad units, and DOS Windows-compatible notebook computers manage, while mobile, the following types of communications:

- Telephone
- Voicemail
- Fax
- Paging
- e-mail

This all-in-one-box solution helps mobile computing professionals stay in touch and informed by providing all of the necessary hardware, software and service components in one package.

The contents of the Apple Mobile Message System include:

- The Apple Notification Service, a "one-stop" activation, billing, and support program
- A PageCard wireless message Type II PCMCIA card receiver with LCD screen from Socket Communications
- Update! receive software and Notify! send software from Ex Machina

- DateBook and TouchBase Pro Bundle software from Adobe Systems
- Message transmission via the PageNet nationwide wireless network
- Wireless gateway services by the National Dispatch Center (NDC)

How It Works

=====

Users of the Mobile Message System receive a PageCard dual-mode display pager from Socket Communications that lets them:

Multiple Sources

Receive and view wireless messages from multiple sources including the Internet

Use when Inserted in PowerBook

Receive, view, store, and transfer messages when the PageCard is inserted in their 500-series PowerBook, where they can:

- View and respond to messages on larger display
- Have their mail automatically uploaded to their PowerTalk universal mailbox
- Receive automatic calendar updates to Aldus DateBook via AppleScript
- Send pages via PowerTalk AppleMail and a modem

Use Integrated Send/Receive Application

Receive, view, and send messages with their Apple MessagePad (with a modem) using integrated send/receive application from Ex Machina

Use IBM PC or Compatible

Receive, view, and send messages on an IBM PC or compatible notebook computer (with a PCMCIA slot and a modem) running Windows using integrated send/receive application from Ex Machina

Notification Services

=====

To take advantage of the capabilities of the Apple Mobile Message System, users must sign up with a vendor that routes transmissions to them. Apple is offering its own low-cost service (as part of the Mobile Message System), the Apple Notification Service. The service is available for a basic monthly fee of \$19.95.

Information about how to subscribe to the Apple Notification Service can be found in two places: in the Apple Notifications Service guide and in the Activation flyer, both of which are included in the package.

As part of the basic Apple Notification service, customers receive a personal

800 number through which they can receive:

- Numeric messages
- Alphanumeric (full text) messages
- Voice mail messages
- Fax documents

The Notification Service routes the numeric and alphanumeric messages directly to customers' PageCards and notifies them that they have received voice mail messages and fax documents.

As part of the basic Apple Notification Service, customers receive the following:

Message Notification

- Nationwide roaming coverage
- Personal 800 number message center
- No separate PIN number needed
- Toll-free fax and voice mailboxes, 30 minutes of use
- 60 messages with 80 alphanumeric characters
- Internet, page send s/w or phone keypad access
- Appoint/calendar updates for DateBook
- Optional operator or on-line access

Internet Notification

- Address is your personal 800 number—e.g. 18008772961@NOTIFICATION.COM
- Message includes sender, subject and text up to 500 characters

QuickMail Notification

- Optional gateway software from Ex Machina: QM-Notify!
- Allows other QuickMail users to send wireless messages to your pager, PageCard
- Receive mail headers and/or body text of message

Users who purchase the Apple Notification Service also have the opportunity to subscribe to the following optional notification services for an additional fee:

Call Notification

All the features of Message Notification, plus

- Live call routing to any desk or cell phone
- Page notification of live call
- Optional outbound calling

Securities Notification (available April 1995)

- Personally selected securities (stocks, bonds, and options) quotes
- Current quotes based on chosen parameters (e.g., price delta, time, volume, high, low, close)

..TIL17104-Apple_Mobile_Messaging_System-Description_7-95_(TA33229).pdf

- Breaking news on selected companies
- Updates to portfolio applications are possible

News Notification (available April 1995)

- Five news categories: headline, business, weather, sports, entertainment
- Optional routing, via AppleScript to news folders on the PowerBook

Bundled Items

=====

Included in the Mobile Message System are the following items:

Physical Device

- Socket PCMCIA T2 Display PageCard
- Small carrying case for card

System Software

- System 7.5 with PowerTalk
- Send/Receive gateways for PowerTalk from Ex Machina
- Send/Receive software for Newton and Windows from Ex Machina
- Other gateways (CompuServe, FaxSTF, QuickMail, Internet)

Application Software

- PowerBook: Aldus/Adobe DateBook/TouchBase

Services

- Apple Notification Service
- Personal 800 number
- Toll free fax mail box
- Receive short messages from the Internet
- Optional nationwide roaming
- Calendar updates to DateBook

Other items in the bundle

- One Apple integrated manual to cover PageCard, software for three platforms
- System 7.5 Upgrade Guide, Apple Guide Help
- Apple Notification activation flyer, Services manual, Quick Reference Card
- Apple Notification Service manual

System Requirements

=====

To use the Apple Mobile Message System, users will need one or more of the following:

- An Apple PowerBook 500 series computer with at least 8MB of RAM and an Apple

PowerBook PCMCIA Expansion Module

- An Apple Newton MessagePad 100 or 110 personal digital assistant
- An IBM or IBM-compatible computer with Microsoft Windows version 3.1 or later, at least 4MB of RAM, a Type II PCMCIA expansion slot, and Card Services software version 2.0 or later
- A Hayes-compatible modem (if you want to send messages)

Availability & Pricing

=====

The Apple Mobile Message System may be purchased only at authorized Apple Value Added Resellers and select Apple authorized resellers.

The ApplePrice for the Apple Mobile Message System (M3516LL/A) is \$549. The basic monthly fee for the Apple Notification Service is \$19.95.

For more information and/or a list of authorized resellers, customers should call the Apple Mobile Message System fax-back number 1-800-510-4955.

Part Number	Description	ApplePrice
M3516LL/A	Apple Mobile Message System	\$549.00
.	Apple Notification Service	\$ 19.95/month

Article Change History:

06 Jul 1995 - Corrected typos.

SCSI Manager 4.3: Purpose of Extension File (9/96)

Revised: 9/4/96
Security: Everyone

SCSI Manager 4.3: Purpose of Extension File (9/96)

Article Created: 1 February 1995
Article Reviewed/Updated: 4 September 1996

TOPIC -----

I understand that the SCSI Manager 4.3 is part of the ROM in my Power Macintosh computer. After I upgraded to System 7.5, I noticed an extension called SCSI Manager 4.3 in the Extensions folder. What is this for?

DISCUSSION -----

SCSI Manager 4.3 is part of the ROM in all versions of the Power Macintosh computer. System 7.5, when installed from the upgrade CD-ROM disc, places the extension in your Extensions folder, but it is not required.

The absence or presence of the SCSI Manager 4.3 extension has no bearing on the performance of your Power Macintosh computer.

The extension normally provides the benefits of the new SCSI Manager to computers that do not have it in their ROM.

The SCSI Manager 4.3.1 extension from System 7.5 Update 1.0 contains software fixes needed only on 68040-based Macintosh computers and the PowerPC Upgrade Card. The 68040-based PowerBook computers do NOT need SCSI Manager 4.3.1 extension because PowerBook computers do not support SCSI Manager 4.3.

Mac OS 7.5.3 and later have the SCSI Manager 4.3 functionality included in the system software, so the extension is not needed.

Article Change History:

04 Sep 1996 - Updated article to include System 7.5.3.
30 Mar 1995 - Added information on System 7.5 Update 1.0.
22 Feb 1995 - Added keyword; made minor technical updates.

Intelligent Battery Recondition Software Troubleshooting (2/95)

Revised: 2/1/95
Security: Everyone

Intelligent Battery Recondition Software Troubleshooting (2/95)

=====

Article Created: 1 February 1995

TOPIC -----

When I run the Intelligent Battery Recondition application on my PowerBook 540c I get the message "Status: Please attach AC adapter." I already plugged in the AC power adapter, but the installer still will not go past this message. What could be the problem?

DISCUSSION -----

The Intelligent Battery Recondition application will not run if it cannot detect any AC power. The problem you describe indicates that your PowerBook 500 Series AC power adapter may be the reason you cannot charge your battery.

At this point, you may want to have the AC power adapter voltage checked by an authorized Apple Service Provider.

If you have another AC adapter, try to run the Intelligent Battery Recondition application again using this AC power adapter. If the Intelligent Battery Recondition application runs without getting the same error message, you will know that the problem is with your other AC power adapter, not with your battery.

Adobe PhotoShop: Determining Scratch Disk Size (2/95)

Revised: 2/2/95
Security: Everyone

Adobe PhotoShop: Determining Scratch Disk Size (2/95)

=====

Article Created: 2 February 1995

TOPIC -----

I am using Adobe PhotoShop 3.0 and when I open a file I get an error message that reads "The scratch disk is full". What is the problem?

DISCUSSION -----

When opening a file, PhotoShop creates a scratch disk three to four times the size of the actual file. For example, if you try and open a 10MB file, the scratch disk it attempts create ranges from 30MB to 40MB. There may not be enough acutual room on the hard disk to open large files. If you have an external hard drive, with enough storage space, you can set the prefrences in PhotoShop to create the scratch disk using a different drive with more storge space. If the problem persists you need to talk to Adobe Technical Support.

StyleWriter: Using Manual Feed With StyleWriter II Driver (2/95)

=====

Article Created: 2 February 1995

TOPIC -----

I am using a StyleWriter with the StyleWriter II printer driver. When I try to print an envelope, the manual feed option is dimmed. How do I use the manual feed option?

DISCUSSION -----

The StyleWriter II printer driver is backward compatible to support the original StyleWriter. Starting with System 7.1.2, the StyleWriter II printer driver is the only driver installed in the Macintosh OS. In order for the printer driver to activate the manual feed option, you must first print to the StyleWriter using the sheet feeder option. After this procedure, the printer driver recognizes that an original StyleWriter is attached to your Macintosh, and the next time you print the manual feed option is available.

DOS Compatibility Card: Bit-Depth Causes Slow AVI Movies (2/95)

Revised: 2/2/95
Security: Everyone

DOS Compatibility Card: Bit-Depth Causes Slow AVI Movies (2/95)

=====

Article Created: 2 February 1995

TOPIC -----

I have a DOS Compatibility Card for the Power Macintosh 6100, and I am trying to use AVI files on it. However, when I try playing these files, they drop both frames and lose sound. The same files work fine on a IBM 486 DX2-50 computer. How can I improve performance? Would performance increase using QuickTime for Windows 2.0?

DISCUSSION -----

The probable cause of the problem is that the AVI movie was compressed as a 16-bit (32,000 colors) or 24-bit (16 million colors) movie and you are trying to play it back on an unaccelerated 8-bit display (256 colors), and the on-the-fly conversion taking place is slowing down the movie.

You can try converting the movie to 8-bit Video for Windows or converting it to QuickTime for Windows 2.0 with the AVI converter, for better frame rate and audio performance. One application that works well for this type of conversion is Adobe Premiere for Windows.

QuickTime for Windows 2.0 is a for-sale product available from APDA, Apple Software Licensing, and online through ZiffNet/Mac and ZiffNet. ZiffNet/Mac and ZiffNet are the online information services all about computing, from Ziff-Davis Interactive, hosted on the CompuServe Information Service. Ziffnet/Mac members can type GO MACSTORE and ZiffNet members can type GO STORE to download the new version of QuickTime for Windows.

Color StyleWriter Pro: Changes in Printer Driver v1.5.2 (2/95)

=====

Article Created: 2 February 1995

TOPIC -----

This article describes the changes made in Color StyleWriter Pro v 1.5.2 printer driver.

DISCUSSION -----

Version 1.5.2 of the Color StyleWriter Pro printer driver fixes two problems found in version 1.5.

- Fixes a problem where Power Macintosh computers would freeze when trying to print to the Color StyleWriter Pro the very first time. The freeze would typically occur while printing the calibration page.
- Fixes a problem involving certain Macintosh computers with 32MB or more of RAM installed would generate an error type -39 when trying to print to a Color StyleWriter Pro.

The Color StyleWriter Pro v1.5.2 update can be found on the online services Apple publishes software updates on.

These articles can help you locate software updates mentioned here:

- Where To Find Apple Software Updates
Lists online services for "free" Apple software updates
- Obtaining Apple Product Support in the USA

Article Created: 2 February 1995
Article Reviewed/Updated: 7 August 1995

TOPIC -----

This article describes the MacX 1.2 product's features, benefits, system requirements, product details, and ordering and licensing information.

DISCUSSION -----

MacX is an X window System display server for the Apple Macintosh and A/UX operating systems. The server lets users in multivendor environments run network-based X client applications on the same Macintosh desktop.

Macintosh users can access X applications by choosing commands from a pull-down menu that displays the X applications in easy-to-use Macintosh windows, and the menu is easily customized. With MacX, users can cut and paste text and color graphics between Macintosh and X client applications.

The X Window System was developed by researchers from the Massachusetts Institute of Technology (MIT) and others from the computer industry.

MacX demonstrates Apple Computer's commitment to industry standards. It complies with Version 11, Release 4 standards and conventions set by the MIT X Consortium. This means that MacX is compatible with all X client applications that follow the X Window System standards.

MacX provides complete X Window system functionality combined with Macintosh ease-of-use for both new and experienced X Window System users. It allows MIS managers to integrate Macintosh computers into an organization that operates in a standardized multivendor setting.

Features and Benefits
=====

- An X Window System display server for Macintosh computers that complies with X Window System standards.
- Access to all Macintosh applications.
- Text and color graphics copy-and-paste capability.
- Ease-of-use including Macintosh windows.
- Support for Macintosh system software version 7 and later.
- Support for color and grayscale applications.
- Support for multiple monitors.
- Support for multiple networking protocols.
- Industry standard Backing Store/Save Under capabilities.
- Provides industry-standard X applications in a multivendor, networked environment.
- Allows users to choose from many easy-to-use Macintosh applications that run alongside X client applications.
- Allows users to move text and image data between Macintosh and X client applications, using familiar copy-and-paste commands and the Macintosh clipboard.
- Allows users to customize frequently accessed X client applications by using pull-down menus. Displays X applications in familiar Macintosh windows for easy moving and resizing.
- Allows MacX users to take advantage of System 7 features and its intuitive interface.
- Displays 256 colors or shades of gray from a palette of 16 million colors.
- Allows client applications to display on multiple screens.
- Permits full use of all major networking protocols including TCP/IP, DECnet, and AppleTalk.
- Allow users to regulate the frequency of window updates for improved performance.

System Requirements and Product Details

=====

Required Equipment

To use MacX you need:

- Any Macintosh computer
- At least 2 MB of memory (5 MB or more recommended)
- System software version 6.0.5 or later
- At least two floppy disk drives, one of which should be an Apple FDHD (for version 6.0.5 or later software)
- A hard disk (for version 7.0 or later software)
- A network connection, using the LocalTalk port or an Ethernet connection

Optional Equipment

You may also want to add:

- An Apple Ethernet NB Card or the equivalent
- A Macintosh 8•24 Graphics card
- An AppleColor High-Resolution RGB Monitor or the equivalent (multiscreen configurations are supported)
- An Apple 16 inch or 21 inch Color Monitor

- A three-button mouse (available from third-party companies)

Standard Conformance

MacX complies with the following standards:

- X Window System, Version 11, Release 4 (includes support for Version 11, Release 4 shape extension)
- X11 protocols
- X logical font description (XLFD) protocol
- ICCCM window management

Network Configurations

MacX takes advantage of the Macintosh Communications Toolbox, allowing many simultaneous connections over different transport protocols. MacX includes:

- MacTCP (Apple's implementation of the TCP/IP protocols)
- AppleTalk ADSP
- DECnet (offered by third-party companies)

MacX Window Manager

MacX includes a built-in window manager that complies with the ICCCM standard. Users can control client applications in windows on their desktops using Macintosh user interface capabilities. The window manager provides:

- Title bars
- Close boxes
- Other Macintosh window controls

Font Manager

MacX includes a font compiler that converts font files from bitmap distribution format (BDF) to the MacX server's internal format. In addition, MacX can access Macintosh TrueType and screen bitmap fonts resident in the Macintosh system. MacX includes the following font families:

- Charter
- Clean
- Courier
- Helvetica
- Lucida (Lucida Bright and Lucida Tupewriter)
- New Century Schoolbook
- Symbol
- Times

Foreign Window Manager Support

MacX includes the capability for use of foreign window managers such as mwm (by OSF/Motif) and twm. A special Macintosh window is dedicated to displaying client applications controlled by a foreign window manager. This window can share the desktop with other client applications controlled by the built-in MacX Window Manager.

Three-button Mouse Support

MacX emulates second and third mouse buttons through the keyboard. Three-button mouse devices are available from third-party companies.

DECWindows Support

MacX is fully compatible with DECWindows conventions for remote startup of applications and for copying and pasting between Macintosh and DECWindows applications. (See a Digital Equipment Corporation representative for more information on PATHWORKS, Digital's network communications package for Macintosh computers, which includes MacX.)

Color Support

MacX supports 8-bit color and grayscale video cards. Users have access to 256 distinct colors or shades of gray from a palette of 16 million colors. MacX supports the following Apple video cards:

- 8•24 Card
- The built-in video card on Macintosh computers (like the Macintosh IIfx)

Ordering and Licensing Information

MacX 1.2

Order Number M0108LL/D, you will receive:

- MacX software and fonts
- MacX Communications software
- MacX Installation Guide
- MacX User's Guide
- MacTCP Connection Tool Module
- MacTCP Administrator's Guide
- MacX Release Notes

MacX Right-to-Copy License

Order Number M8102LL/A

This license grants the right to copy MacX to one additional system.

MacX 1.2 Update Product

Order Number M01197LL/B

With your order you receive software and manuals to update any version of MacX to version 1.2

MacX Manual Set

Order Number M0602LL/C

With your order you receive additional manuals for licensed systems.

- MacX Installation Guide
- MacX User's Guide

- MacTCP Administrator's Guide

MacX Right-to-Update License

Order Number M8103LL/A

This license grants the right to update any version of MacX to one additional system.

ImageWriter II: Single Sheets of Paper Require Manual Feed 2/95

=====

Article Created: 3 February 1995

TOPIC -----

Whenever I try printing to my ImageWriter II using single sheets of paper, the top margin is not what I specified in my application. How can I get the proper margin in my document?

DISCUSSION -----

This occurs when you select Automatic in the Print dialog. Instead, select Hand Feed or Manual Feed depending on the printer configuration. You should Automatic only when you are using tractor feed paper.

Color StyleWriter 2400: Printing Problems with Print Shop (1/97)

=====

Article Created: 3 February 1995
Article Reviewed/Updated: 9 January 1997

TOPIC -----

I am having problems trying to print to my Color StyleWriter 2400 from Print Shop Deluxe.

DISCUSSION -----

If you having problems printing to the Color StyleWriter 2400, you need to upgrade your version of PrintShop Deluxe. Both Print Shop Deluxe 1.1.1 and Print Shop Deluxe CD Ensemble v1.0, by Broderbund, provide support for printing to the Color StyleWriter 2400 printer.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

StyleWriter II: No Background Printing With WordPerfect (2/95)

=====

Article Created: 3 February 1995

TOPIC -----

When I print from WordPerfect v3.0 to my StyleWriter II, it continues to spools my document until I run out of disk space. How can I correct this?

DISCUSSION -----

This problem occurs with Word Perfect v3.0 and any serial printer such as the StyleWriter II, Personal LaserWriter 300, and LaserWriter Select 300. To correct this problem permanently, contact WordPerfect for an upgrade.

Deleting Spooled Documents

=====

- 1) Open the System Folder
- 2) Throw the Print Monitor Documents folder into the Trash
- 3) Restart

Temporary Workaround

=====

- 1) Open the Chooser
- 2) Turn off Background Printing

Do not try printing the same document. If you do, the same thing will happen again. Sometimes you can copy the document and paste the information into a new document, then print the new document.

To locate a vendor's address and phone numbers, use the vendor name as the search string.

Macintosh Software Updates: Order for Installation (5/95)

Revised: 5/1/95
Security: Everyone

Macintosh Software Updates: Order for Installation (5/95)

=====

Article Created: 06 February 1995
Article Reviewed/Updated: 1 May 1995

TOPIC -----

I have System 7.1, System Update 3.0, Network Software Installer, and Express Modem Software to install on my Macintosh. What order should these products be installed.

DISCUSSION -----

Installation of Macintosh system software is pretty flexible. After installing the Mac OS System Software, examine the Read Me file for any additional packages that you intend to install. Check to see if any order dependencies are mentioned (usually there are none). If there are no dependencies, you can usually install packages in any order.

The Apple Installer program will check to see if the system has later versions of software installed already. Generally, it will not let you downgrade, or go backwards, with respect to versions of software already installed as this could cause problems and is not what users would want to happen. Take, for example, a file like the Apple Shared Library Manager (ASLM), which comes with GeoPort, QuickTake, AppleShare 4.x, ARA MultiPort Server, Apple Internet Router, Apple IP Gateway, Open DB Connectivity, and MacSNMP. Not that you would want to install all of these products, but the order you install any set of them is unimportant. In this case, after installing some set of packages, the Installer will have placed the latest version of ASLM in the Extensions folder from whatever package contained the latest version.

Occasionally, the installer script will recognize that software could be downgraded by the installation and you will be presented with a warning stating that you are trying to install software that is older than what's already installed. That warning will allow you to cancel the whole installation or choose the Older or Newer component. We would recommend selecting Newer unless you are trying something out of the ordinary.

NOTE: Any version of ASLM greater than 1.1 is compatible with all software that utilizes the manager. There are no compatibility problems other than those for software written to the 1.0 ASLM API, of which all (that we are aware of) have been revised to the current API.

If you desire more of a roadmap, you should install packages in the order that they were released, as each package will have probably been tested with all packages before its release. To install packages in the order that they were released chronologically, note the modification date on the Installer script file, (not the installer application), by doing a Get Info of the Installer script document. These dates should correspond closely to the release date of the package. Installing in the order of release date should be a safe installation technique.

Article Change History:

01 May 1995 - Added note to article on ASLM 1.1 compatibility.

DOS Compatibility Card: Ethernet Drvr Does Not Use IRQ's (2/95)

=====

Article Created: 6 February 1995

TOPIC -----

I need to know the Ethernet IRQ settings for the DOS Compatibility Card. I have a DOS application that needs to know the IRQ settings.

DISCUSSION -----

The ethernet driver (MACODI.COM) used for the built-in Ethernet on the DOS Compatibility Card does not use IRQs. It conforms to the ODI specification for a Multiple Link Interface Driver (MLID), which do not use IRQs. You are probably trying to use a NDIS application, whose drivers DO use IRQs. If this is the case, you need to use Novell's ODI to NDIS translator (odinsup.com) to configure the software to function in an ODI environment. For more information on odinsup.com, contact Novell Inc.

To locate a vendor's address and phone numbers, use the vendor name as the search string.

Color OneScanner: Difference Between Rev A and Rev B (2/95)

=====

Article Created: 6 February 1995

TOPIC -----

Is there any way to tell the difference between the Apple Color OneScanner rev. A and rev. B from the outside?

DISCUSSION -----

Yes, the Apple Color OneScanner Rev.A has a lamp replacement access door on the right side of the scanner. This door is absent on the Apple Color OneScanner Rev.B.

The removal of the access door is the only difference (both internal and external) between the Rev. A and Rev. B Apple Color OneScanner .

LaserWriter 16/600 PS: Envelope Feeder Capacity (2/95)

Revised: 2/7/95
Security: Everyone

LaserWriter 16/600 PS: Envelope Feeder Capacity (2/95)

=====

Article Created: 7 February 1995

TOPIC -----

This article describes the LaserWriter 16/600 PS envelope feeder capacity and envelope sizes.

DISCUSSION -----

Here are the envelope sizes supported:

Envelope	Weight	Size
-----	-----	-----
COM 10	24 pound	4 1/8 in. X 9 1/2 in. (104.7 mm x 241.3 mm)
Monarch	24 pound	3 7/8 in. x 7 1/2 in. (98.4 mm x 190.5 mm)
DL	80 g/square meter	110 mm x 220 mm
C5	90 g/square meter	162 mm x 229 mm

The envelope feeder will hold up to 75 standard business envelopes.

Both the new envelope feeder and the optional second sheet feeder are backwards compatible with the LaserWriter 630 printer. The accessories for the LaserWriter 630 are NOT forward compatible to the LaserWriter 16/600 PS printer.

System 7.5: Clean Installation from the Hard Drive (9/95)

Revised: 9/6/95
Security: Everyone

System 7.5: Clean Installation from the Hard Drive (9/95)

Article Created: 7 February 1995
Article Reviewed/Updated: 6 September 1995

TOPIC -----

This article presents the steps necessary to perform a clean installation of system software version 7.5 when the installer software has been pre-loaded on the hard drive. Follow these instructions in the order presented.

DISCUSSION -----

Purpose of a Clean Installation

A normal system software installation modifies and updates the existing System Folder. A clean installation disables the existing System Folder, leaving most files in place, and forcing the Installer to create a new System Folder.

A clean system installation brings the system software back to the standard configuration. This is necessary when system software has been damaged or modified, preventing a normal installation. It is also useful in troubleshooting.

Follow these instructions in the order presented.

Restart with Disk Tools

Shut down your Macintosh computer, insert Disk Tools in the floppy drive, and turn on the computer. At the desktop, the Disk Tools floppy disk's icon should be in the upper-right corner of your screen with your hard disk's icon below it.

If the computer ejects the Disk Tools disk, make sure you have the Disk Tools specified for your model Macintosh.

Run Disk First Aid

Disk First Aid can detect and repair problems with a hard disk.

- 1) Open the Disk Tools disk, and double-click on the Disk First Aid icon.
In the window that appears, select the main hard drive.
- 2) Click once on Verify. Disk First Aid will check your hard disk for any potential problems. If it finds problems, you should let the software repair them.
- 3) Repeat this procedure for each hard disk attached to the system.
- 4) When you're finished verifying the hard disks, choose Quit from the File menu to return to the desktop.

If Disk First Aid cannot repair a hard disk, you should back up the hard disk and reinitialize it using the appropriate formatting utility for that drive. For Apple SCSI drives, use Apple HD SC Setup. If you have an Apple IDE drive, use Intrnal HD Formatter or Drive Setup 1.0.2.

Update Hard Disk Drivers

If you do not have an Apple hard drive, or you use third-party software to format your hard disk, do not use the Apple HD SC Setup utility. However, you should contact your hard drive vendor to verify that your formatting software is compatible with system software version 7.5.

If you have an Apple SCSI hard drive, you should update the drivers with the version of Apple HD SC Setup that is in the System 7.5 folder, following these steps:

- 1) Double-click the Apple HD SC Setup icon on the Hard Drive to open it.
- 2) Click on the Update button.
- 3) When you're finished, click Quit to return to the desktop.

Sometimes HD SC Setup can not update the hard disk driver (indicated by a "dimmed" Update button). Here are some possible causes and solutions:

- If a third-party utility formatted your hard disk, you should obtain the latest version of the utility to update your hard drive.
- If a version of Apple HD SC Setup more recent than the version on the Disk Tools disk formatted your hard drive, do not update the hard disk drivers.
- If an earlier System 6 version of Apple HD SC Setup formatted the drive, it may not have left enough room for the updated driver. You do not have to update the hard disk drivers. However, if you intend to use file sharing or have a Macintosh that can use virtual memory, then you need to back up the disk and reinitialize it with HD SC Setup. This erases the disk, so be certain you back up the hard disk

first.

- If the driver is corrupt, the Macintosh does not recognize the drive (that is, the drive doesn't show on the desktop when you start from a floppy disk). You may wish to reinitialize it with HD SC Setup. This erases the disk, so be certain you back up the hard disk first.
- If the driver was modified with disk compression or security software you may not be able to update the SCSI drive with Apple HD SC Setup. Contact the vendor for any special instructions.
- If your internal hard drive is not a SCSI hard drive, but an IDE drive, you should use Internal HD Formatter or Drive Setup 1.0.2. These utilities are available from online services and are able to test and update the drivers on IDE drives.

Check Available Hard Disk Space

Be sure you have at least 21MB available on the hard disk where you plan to install the system software. Open the hard disk's window. Open the Views control panel and select "Show disk info in header." The amount of available disk space appears in the upper-right corner of any open window.

If there's less than 21MB available, you'll need to delete some unnecessary files by moving them to the Trash. Choose Empty Trash from the Special menu, and you will have more disk space available. Also you can copy files onto floppy disks or other media before moving them to the Trash.

Performing a Clean Install

-
1. Start up the computer while holding down the Shift key until you see the message "Welcome to Macintosh, Extensions Off."
 2. Double-click the Installer located on the Hard Drive. Pass through the Welcome to System 7.5 dialog box.
 3. Check the destination drive and make sure the Hard Drive is selected.
 4. Press the Command-Shift-K keys simultaneously.

You are presented with a small dialog box with two selections:

- Update existing system folder
- Install new system folder

For a clean install, select Install new system folder. This installs a new system folder and renames your current folder to "Previous System Folder".

After performing a System 7.5 Clean Install, when About This Macintosh is selected under the Apple menu, it no longer displays the specific Macintosh name. Instead, it displays only "Macintosh", "Macintosh Powerbook", or "Power Macintosh" depending on which system it is running on.

If System 7.5 is installed over an existing system (pre 7.5), it retains the specific Macintosh name for the About This Macintosh window. This holds true for future Macintosh computers also.

Restart Your Computer

Choose Restart from the Special menu. The system automatically ejects the Disk Tools disk, and it should boot on the Hard Drive normally.

Verify Problem Resolution

After performing a clean installation, verify that you resolved the problem before adding anything to the new System Folder. Adding items to the System Folder before resolving your problem defeats the purpose of this procedure.

Install Non-Standard Items

You can now reinstall the non-standard items from the old System Folder (now named "Previous System Folder") such as fonts, screen savers, device drivers, and so on. If possible, you should reinstall these items from their original disks.

If the original disks are not available, you may move the non-standard items from the Previous System Folder to the new System Folder. Be careful not to replace anything that is already in the new System Folder. Only move items that are not already in the new System Folder.

- 1) Open each corresponding folder within the System Folder and the Previous System Folder then compare the contents.
- 2) Move anything that is not already in the new System Folder and its subfolders from the Previous System Folder and its subfolders.
- 3) Restart your Macintosh.

Troubleshooting Extension Conflicts

If you have installed any system extensions or control panels, you will probably see their icons line up across the bottom of the screen when you restart. They load into memory at startup time and modify the standard behavior of the operating system.

Verify INIT Conflict

If the Macintosh fails to restart or behaves erratically, you probably have an incompatible or conflicting INIT (also known as a system extension or control panel). To verify this problem, follow these steps:

- 1) Be sure the Caps Lock key is off.
- 2) Restart, and after you see the picture of a computer with a smile, hold down the Space Bar key.
- 3) Release the Space Bar key when the "Extensions Manager" window appears.
- 4) Select "All Off" in the Sets pull down menu then close Extensions

Manager.

5) When the Macintosh is ready, try to recreate the erratic behavior.

If the problem no longer occurs, then you have a conflicting extension or control panel. Continue with the steps in the next section.

Turn On and Turn Off INITs in System Folder

1) Using the Extensions Manager turn on your Extensions and Controls Panels one at a time.

2) Close the Extensions Manager, and restart the Macintosh.

3) Attempt to recreate the original problem.

Repeat steps 1 through 3 for each item in the Extensions Manager until the problem reoccurs. The last item activated in the Extensions Manager is probably the cause of the problem.

Final Steps

Verify that your applications are performing normally. If not, refer to the application manual or contact the vendor.

When the Macintosh behaves as expected, move the Previous System Folder to the Trash, and choose Empty Trash from the Special menu.

LaserWriter Pro 630: Windows Driver Available Online (8/95)

Revised: 8/23/95
Security: Everyone

LaserWriter Pro 630: Windows Driver Available Online (8/95)

Article Created: 7 February 1995
Article Review/Updated: 23 August 1995

TOPIC -----

I have a LaserWriter Pro 630 connected to my MS-Windows computer, but I cannot find the proper printer driver for it. There are four Apple LaserWriter drivers that ship with Windows, which driver should I use?

DISCUSSION -----

For the LaserWriter Pro 600 and LaserWriter Pro 630, you can either use the LaserWriter IINTX driver that ships with Windows, or you can download the LaserWriter Pro printer drivers from online services. If you use the LaserWriter IINTX driver, you will not be able to specify paper and tray options. The LaserWriter Pro 600/630 printer drivers are available from Online services which Apple publishes software updates on.

If you are printing from MS-DOS applications, usually you will use the generic PostScript printer driver. Apple does not provide drivers for specific MS-DOS applications.

These articles can help you locate software updates mentioned here:

- Where To Find Apple Software Updates
Lists online services for "free" Apple software updates
- Obtaining Apple Product Support in the USA

Microsoft Office: Command-Option-Tab Switches Apps (2/95)

=====

Article Created: 07 February 1995

TOPIC -----

I just installed System 7.5 and Microsoft Office and I notice that hitting the Command-Option-Tab key combination switches between applications.

Where did this feature come from?

DISCUSSION -----

Microsoft Office installs a Control Panel with an option called QUICKSWITCH that allows you to do this-it can be toggled on or off.

Newton Power Organizer Pack Instruction Addendum (2/95)

Revised: 2/7/95
Security: Everyone

Newton Power Organizer Pack Instruction Addendum (2/95)

=====

Article Created: 7 February 1995

TOPIC -----

This article contains the Newton Power Organizer Pack Instruction Addendum.

DISCUSSION -----

Newton Power Organizer Pack Instruction Addendum

=====

For Macintosh users:

These instructions replace the section "Installing Newton Package Installer" in the pamphlet "Installing Newton Packages Using Your Computer."

- 1) Unlock the Notion and NPI floppy disk by sliding the black tab in the upper-right corner of the disk so that it covers the square hole.
- 2) Insert the floppy disk into your disk drive.
- 3) Choose Empty Trash from the Special menu. Emptying the Trash will remove an outdated version of the software. You will not lose anything that you need on the disk.
- 4) Open the floppy disk icon.
- 5) Open the Newton Package Installer folder.
- 6) Select the Apple Modem Tool and the AppleTalk ADSP Tool and drag them to the icon of the System Folder on your startup disk.
- 7) You'll see a message asking whether you want to install these items in the Extensions folder. Click OK.
- 8) You may see a message asking whether you want to replace items with

the same name click OK.

- 9) If you wish to use NPI to install other Newton packages, drag the NPI icon from the Newton Package Installer folder to your hard disk.

Note: NPI is automatically placed on your hard disk when you install the ExpensePlus software (contained in the other envelope you received). If you plan to install ExpensePlus, you don't need to copy NPI to your hard disk.

- 10) Restart your computer by choosing Restart from the Special menu. The floppy disk is ejected.
- 11) After the Welcome to Macintosh screen appears, push the floppy disk back into the disk drive.
- 12) Newton Package Installer is now ready to use. Turn now to the section "Installing the Notion Software on Your Newton" in the pamphlet "Installing Newton Packages Using Your Computer."

For Windows Users:

You can ignore or delete the "!desktop.fol" folder on the Notion disk. It contains an outdated version of the software. Proceed as instructed in the pamphlet "Installing Newton Packages Using Your Computer."

At Ease 2.x: Cannot Lock Startup Volume on IDE drives (2/95)

Revised: 2/7/95
Security: Everyone

At Ease 2.x: Cannot "Lock Startup Volume" on IDE drives (2/95)

=====

Article Created: 7 February 1995

TOPIC -----

I installed At Ease 2.x for Workgroups on my Macintosh 630 computer, and I cannot select the "Lock Startup Volume" option. I have tried upgrading from At Ease for Workgroups version 2.0 to 2.0.1 and 2.0.3, but the option is dimmed regardless of the version.

DISCUSSION -----

Apple uses Integrated Drive Electronics (IDE) hard disks on the Macintosh 630 family and PowerBook 150 computers. As indicated in the At Ease ReadMe file, the dimmed security option is the correct behavior for At Ease when it detects a hard disk with an incompatible driver or when the hard disk has been partitioned with A/UX.

The hard disk drivers used on Apple computers with IDE drives are not currently compatible with this feature of At Ease. There is no workarounds for this problem. A new hard disk driver needs to be installed on the drive. Apple's formatting utility for IDE drives currently does not install a compatible driver.

The following computers are in the Macintosh 630 family: Performa 630, Performa 635, Performa 636, Performa 637, Performa 638, LC 630, and Quadra 630.

Who Built America CD and Type 15 Error (2/97)

Revised: 2/24/97
Security: Everyone

"Who Built America" CD and Type 15 Error (2/97)

Article Created: 7 February 1995
Article Reviewed/Updated: 24 February 1997

TOPIC -----

When I try to launch the application on my "Who Built America?" CD I get a Type 15 error. I got this CD with the Apple Education Series Elementary Reference Bundle. I installed a new version of QuickTime (2.0), but that didn't fix the problem. What's wrong?

DISCUSSION -----

The CD (compact disc) you have, "Who Built America? From the Centennial to the Great War, 1876-1914 by The American Social History Project," is produced by the Voyager Company.

The Type 15 error will occur regardless of which version (1.6.1 or 2.0) of QuickTime is installed in your system.

The reason you are getting a Type 15 error message is that the "Who Built America?" HyperCard stack needs a higher memory allocation. The Voyager Company has stated that the HyperCard Player application needs to have 5MB of RAM allocated to it in order to open their HyperCard stack.

HyperCard Player is available on the "Who Built America?" CD and in the Extras folder of the System 7.5 CD. Copy it from one of these CDs to your Macintosh Hard Drive.

To Allocate More Memory to HyperCard Player

-
- 1) Quit out of the HyperCard Player application if it is running.
 - 2) Locate and click on the HyperCard Player application icon on your Macintosh hard drive (not the HyperCard Player application on the CD).
 - 3) Choose "Get Info" from the File menu and increase the amount of

memory allocated to the HyperCard Player application in the "Preferred size" box to 5000.

- 4) Close the "Get Info" window and double-click the HyperCard stack "Who Built America?" on the CD.

Apple MessagePad 110: System 1.3 Update Read Me (2/95)

Revised: 2/7/95
Security: Everyone

Apple MessagePad 110: System 1.3 Update Read Me (2/95)

=====

Article Created: 7 February 1995

TOPIC -----

This article contains the Read Me file that comes with the Newton System Update 1.3.

DISCUSSION -----

Information about a modem-related problem with the MessagePad 110 and System Update 1.3 (345025):

When you have used a modem to initiate a telephone call to someone and you click the close box on the MessagePad 110 to tell the modem that it can hang up (because you have lifted the telephone receiver to begin talking with the person), the modem does not hang up and the buttons on the bottom of your MessagePad screen don't respond to taps.

To be able to use the buttons on your MessagePad screen again, press the Reset button inside the battery compartment on the MessagePad. (Pressing Reset does not erase the information in your MessagePad.)

If you used an Apple external modem to initiate the call, you also need to remove and then reinsert one of the batteries in the modem to hang up the modem (to stop the modem from depleting its battery power).

Note: This problem does not occur when you use the modem for other purposes, such as faxing or NewtonMail.

Global Village TelePort Fax Software: QuickDraw GX Aware (10/95)

Revised: 10/4/95
Security: Everyone

Global Village TelePort Fax Software: QuickDraw GX Aware (10/95)

Article Created: 8 February 1995
Article Reviewed/Updated: 4 October 1995

TOPIC -----

The Global Village TelePort Fax/Modem software, GlobalFax, for versions earlier than 2.5 are not accessible when QuickDraw GX is active. How do I get my Fax software to work with QuickDraw GX?

DISCUSSION -----

GlobalFax versions earlier than 2.5 are not recognized by QuickDraw GX. It is not an incompatibility, but rather non-GX aware software that is not available when QuickDraw GX is active. One solution is to turn QuickDraw GX off in the Extensions Manager control panel and then restart when wanting to send a Fax. To turn QuickDraw GX back on, select it in the Extensions Manager control panel and restart.

Another solution is to upgrade to GlobalFax 2.5.2P or later, which is available on online services.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

StyleWriter II Driver: Print Head Cleaning Feature (2/95)

Revised: 2/8/95
Security: Everyone

StyleWriter II Driver: Print Head Cleaning Feature (2/95)

=====

Article Created: 8 February 1995

TOPIC -----

Is the StyleWriter II driver feature that allows the user to specify a print head cleaning prior to a print job, available when printing to the original StyleWriter?

DISCUSSION -----

The print head cleaning feature of the StyleWriter II driver is NOT available when printing to the original StyleWriter printer. The first print job sent to the printer will list it as an option. During the first print job, the driver determines which type of StyleWriter is being used. If the driver detects an original StyleWriter then all subsequent print jobs will show the options button grayed out. If a StyleWriter II printer is later connected, the options button will remain grayed out until one print job has been sent to the printer, thereby giving the driver the opportunity to determine what type of printer is connected.

HyperCard: Changing and Printing Card Headers (2/95)

=====

Article Created: 8 February 1995

TOPIC -----

How can I add, change, or remove a header when I print a single card from my HyperCard stack?

DISCUSSION -----

The Print Card command in HyperCard gets its header information from the header text box in the Print Stack dialog box.

To Add, Change, or Remove a Header from a Card
=====

Step 1

Pull down the File Menu and choose Print Stack. The Print Stack dialog box will open.

Step 2

Type the desired header text in the text window at the bottom of the dialog box.

Step 3

Click the Print button. The Print dialog box will open.

Step 4

Since you do not actually want to print the whole stack, you only want to print a single card, click the Cancel button. The changes you made to the header text will be saved.

Step 5

Pull down the File Menu and choose Print Card. You will now see the header text that you entered in the Print Stack dialog box at the top of the card.

NOTE: If you click the Cancel button in the Print Stack dialog box instead of the Print button (Step 3), your changes to the header text will not be saved.

LaserWriter: LaserWriter Fax Tune-Up ReadMe (2/95)

Revised: 2/9/95
Security: Everyone

LaserWriter: LaserWriter Fax Tune-Up ReadMe (2/95)

=====

Article Created: 9 February 1995

TOPIC -----

This article contains the LaserWriter Fax Tune-Up ReadMe file.

DISCUSSION -----

Using LaserWriter Fax Tune-Up

WHY

The fax tune-up program prevents certain problems when you print out oversize faxes on your LaserWriter printer.

- If you receive banner-size or legal-size faxes, your printer will reduce the fax to fit the paper size that's in the largest-size paper tray you have installed (letter, A4, or legal).
- If you receive letter-size faxes with no margins, your printer will reduce the fax to fit letter-size paper with margins.

HOW

1. Open the Chooser and make sure that the printer you use for your faxes is selected.
2. Open the fax tune-up program.

IMPORTANT

If you have restarted your printer, or turned it off and then on again, you have to open the fax tune-up program AGAIN before using your printer to print out oversize faxes. The printer keeps the instructions it receives from the fax tune-up program in its memory, and it loses those instructions when it is turned off or restarted.

PCMCIA Expansion Module: Can Read DOS Formatted Volumes (5/96)

Revised: 5/27/96
Security: Everyone

PCMCIA Expansion Module: Can Read DOS Formatted Volumes (5/96)

Article Created: 09 February 1995
Article Reviewed/Updated: 27 May 1996

TOPIC -----

I have noticed that many storage PCMCIA cards (PC Cards) are formatted for use with DOS systems. Is it possible to use these PC Cards with my PowerBook 500 series computer and Apple PCMCIA Expansion Module?

DISCUSSION -----

Most storage PCMCIA cards (PC Cards™) are pre-formatted as DOS volumes. PowerBook 500 series computers have the ability to mount these volumes thanks to the Macintosh PC Exchange software that ships with every PowerBook.

For correct results, it is necessary to use PC Exchange version 2.0.2 or greater (this version is included with System 7.5 or can be acquired by contacting the Apple Order Center. To install a newer version of Macintosh PC Exchange, drag the PC Exchange icon into the Control Panels folder of your System Folder and click "OK" to overwrite the older version of PC Exchange. Restart your Macintosh.

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center's phone number.

Note that while you can use PC Exchange to read and write data from/to DOS volumes and erase data from PC cards, it cannot be used to alter the format of a PC Card (from DOS to Macintosh or vice versa). If you wish to change a DOS-format card to a Macintosh format, simply turn PC Exchange off (open the PC Exchange control panel and select the Off option) and then reinsert the PC card. You will then be prompted to reformat the PC card as a Macintosh volume. Once the PC card is reformatted, you can turn PC Exchange back on from the control panel.

Macintosh PC Exchange will not allow you to reformat a Macintosh-format PC card as a DOS-format PC card. To do so you should use a DOS/Windows computer.

A note on Ministor PC Cards:

Some PC Cards from Ministor contain factory-installed compression software that is specific to DOS/Windows computers. This compression software consumes usable disk space and should be deleted for use with PowerBook computers. Select the "Erase Disk..." command from the Finder's Special menu in order to delete this software.

Locating Vendor Information

Article ID: 17159
Created: 2/9/95
Modified: 1/4/00

TOPIC

How can I search for just a particular vendor's name, address, and phone number?

DISCUSSION

To locate a vendor's name, address, and phone number proceed to Apple's Macintosh Products Guide website located at:
<http://guide.apple.com>

The Apple's Macintosh Products Guide website catalogs over 15,000 products for the Macintosh. This website contains a search features that allow you to search by a vendor company's name or other criteria.

If, however, you prefer to use the TIL to search for a vendor, use the vendor name as a search string in addition to the keyword 3pty. 3pty refers to a third party (non-Apple) company.

Sample Search Strings:

XYZ Company and 3pty
ABC Corporation and 3pty
123 and 3pty

TIL Article 22104: "[**Tech Info Library: Basic Search Techniques**](#)", contains a list of useful keywords and instructions describing how to improve your searching techniques.

Locating Vendor Information (3/95)

Revised: 3/1/95
Security: Everyone

Locating Vendor Information (3/95)

=====

Article Created: 9 February 1995
Article Reviewed/Updated: 1 March 1995

TOPIC -----

How can I search for just a particular vendor's name, address, and phone number?
I have been trying to enter just the vendor name as my search string, but I get
too many articles and cannot find the phone number.

DISCUSSION -----

This article, "Locating Vendor Information," suggests the best way to locate a
particular vendor's address and phone number without getting too many articles
which refer in some way to a company's products, but do not contain the company
address or phone number.

To locate a particular vendor's address and phone number only, use the vendor
name as a search string in addition to the keyword 3pty. 3pty refers to a third
party (non-Apple) company.

Sample Search Strings:

XYZ Company and 3pty
ABC Corporation and 3pty
123 and 3pty

The TIL article, "Tech Info Library: How to Search for Articles," contains a
list of useful keywords and instructions describing how to improve your
searching techniques.

Article Change History:

01 Mar 1995 - Added the title of the article, "Locating Vendor Information,"
to the text to increase its relevancy ranking.
10 Feb 1995 - Added reference to "How to Search" article.

PowerTalk and System 7.5: -15064 Error (2/95)

Revised: 2/9/95
Security: Everyone

PowerTalk and System 7.5: -15064 Error (2/95)

Article Created: 9 February 1995

TOPIC -----

We have two computers set up with System 7.5 and PowerTalk. One is new with clean system software, the other is an existing computer. Everything works fine except for PowerTalk. The situation is as follows:

- We use several mail services like CompuServe, MS Mail, and Eudora.
- On the clean computer, when we select "I'm at..." and then click on any of the options, there is no problem.
- On the existing computer, when we select either MS Mail, or Direct Dial from "I'm at...", an error, -15064, appears.

We tried to resolve the problem by start the existing computer with only system 7.5 extensions loaded. We added one extension at a time, then tried selecting MS Mail or Direct Dial until the error appeared. The error still appeared and we couldn't track it down to any one extension. What is does the -15064 error signify?

The version of MS Mail used is 3.1d client and 3.1a server. We thought at first it was a Microsoft problem, but with the error appearing on Direct Dial also, it looks more like a system error.

Any help you could give, would be gratefully received.

DISCUSSION -----

In the course of testing with Direct Dialup, we also got the -15064 error when trying to enable Direct Dialup in the I'm at... menu. The only way we got around this error was to open the setup for Direct Dialup in the Key Chain and enter the phone number for the Modem Telephone. We suspect there may be a similar problem with the MS Mail setup. Error -15064 is: kMailSetFailed.

Sound Control Panel: Volume Level Anomaly (5/95)

Revised: 5/9/95
Security: Everyone

Sound Control Panel: Volume Level Anomaly (5/95)

=====

Article Created: 06 March 1995
Article Reviewed/Updated: 09 May 1995

TOPIC -----

I have the Built-in Headphones slider set all the way up and the Built-In slider set in the middle. When I restart, the sound is lower, but the Headphones slider still shows that it set to the maximum setting. Why does the sound volume change after I restart my computer?

After the restart, all I need to do is move the Built-In Headphones slider slightly and the volume is reset to the level indicated by the Built-in slider. The startup chime will also use this setting.

DISCUSSION -----

What Is Happening

There is inconsistent visual feedback between the Built-in Headphones slider setting in the Sound control panel and the actual level heard through the external speakers to the Power Macintosh.

The purpose of the two separate sliders is to provide the ability to control the sound output for the internal speaker versus the headphones. That is, you may wish to have the sound play very softly (or no sound at all) out of the internal speaker, but you may also want to have the the sound play loudly out of the headphones.

Workaround

The workaround is to set both the Built-in and Built-in Headphones sliders to the same position.

AppleScript: Script Editor Error Source Not Available (2/95)

Revised: 2/10/95
Security: Everyone

AppleScript: Script Editor Error "Source Not Available" (2/95)

=====

Article Created: 10 February 1995

TOPIC -----

The script below, gives the error "Source not available" on repeated runs when the events log window is open and "Show Event Results" is checked. The script worked fine for a period of time, until suddenly this error started occurring.

```
set FinderLib to load script (alias ((path to ~  
    extensions folder as string) & "Scripting Additions:finderLib"))
```

DISCUSSION -----

This script is actually getting a -1756 error. This can be determined by surrounding the given statement with an AppleScript try / on error processing statement. This error code is returned from a call to OSASGetSource function to decompile the script data, and obtain the equivalent source data. The problem is that finderLib is compiled and saved with Save As Run-Only which does not save the AppleScript text with the object for later editing and display.

FinderLib was intended to be used with the "barely-scriptable" Finder of System 7.1 or the Finder 7.0 after ResEditing an aete resource into the Finder. AppleScript 1.0 came with Script Editor 1.0.1 and the finderLib facility. This version of the Script Editor did not have the event window logging capability that came with AppleScript 1.1 and Script Editor 1.1 and later.

The Script Editor's event logging facility depends on being able to access the source AppleScript, to do event logging, AND show event results against a compiled AppleScript. As you found, if Show Event Results are not selected, the Script Editor can run the script just fine against a saved as Run-Only compiled script, since not as much logging detail is being requested.

What probably happened is, you have upgraded to AppleScript 1.1 where the error will be noticed with finderLib, or you saved other loaded and compiled scripts as Run-Only. To use the full debugging facilities of the Script Editor against loaded compiled scripts, the scripts must be saved with the AppleScript source,

for example not as Run-Only. In a compiled AppleScript, you can tell with a resource editor, whether it's saved as Run-Only or not by the presence of an "scpt" resource, which is where the compiled text is saved.

The following event logs demonstrate what's happening. If you want to reproduce this, compile the miniFinderLib AppleScript, place it in the Scripting Additions folder and run the driving AppleScript from the Script Editor with full event logging. You will see the results similar to the first log. Note how the saved AppleScript text is displayed in the event logging window. Recompile miniFinderLib, save it as Run-Only and rerun the driving AppleScript. This will give the -1756 error or sources not available.

The driving AppleScript:

```
try
    set FinderLib to load script (alias ((path to ~
        extensions folder as string) & "Scripting Additions:miniFinderLib"))
    tell FinderLib to emptyTrash()
on error ErrMsg number ErrNmbr
    log ("Error " & ErrNmbr & ": " & ErrMsg)
    display dialog "Error " & ErrNmbr & ": " & ErrMsg
end try
```

The miniFinderLib script:

```
on emptyTrash()
    --
    -- Asks the Finder to empty the trash
    --
    tell application "Finder" to empty trash
end emptyTrash
```

Script Editor log with Show Event Results against a compiled library with the source saved:

```
tell current application
    path to extensions folder as string
    --> "Macintosh HD:System Folder:Extensions:"
    load script ~
alias "Macintosh HD:System Folder:Extensions:Scripting Additions:miniFinderLib"
    --> on emptyTrash()
    --
    -- Asks the Finder to empty the trash
    --
    tell application "Finder" to empty trash
end emptyTrash
end tell
tell application "Finder"
    empty trash
end tell
```

Script Editor log without Show Event Results against a compiled library saved as Run-Only:

```
tell current application
  path to extensions folder as string
  load script ~
alias "Macintosh HD:System Folder:Extensions:Scripting Additions:miniFinderLib"
end tell
tell application "Finder"
  empty trash
end tell
```

Script Editor log with Show Event Results against a compiled library saved as Run-Only:

```
tell current application
  path to extensions folder as string
  --> "empty trash:Extensions:"
  load script ~
alias "Macintosh HD:System Folder:Extensions:Scripting Additions:miniFinderLib"
  (*Error -1756: Source not available.*)
  display dialog "Error -1756: Source not available."
  --> {button returned:"OK"}
end tell
```

System 7.5: Folder Protection Option Not Available (1/97)

Revised: 1/25/97
Security: Everyone

System 7.5: Folder Protection Option Not Available (1/97)

=====

Article Created: 10 February 1995
Article Reviewed/Updated: 25 January 1997

TOPIC -----

Why is the System Folder "locking feature" not available on all of my Macintosh computers that are running System 7.5? It works on some of my Macintosh computers, but not all of them.

Can I enable System Folder "locking feature" on one of my computers and then copy the General Controls control panel from that computer onto all of my other computers instead of resetting each of their General Controls control panels?

DISCUSSION -----

System 7.5

This folder "locking feature" you describe is called Folder Protection. It gives you the ability to protect the System Folder or Applications Folder from change or accidental deletion. It is a function of System 7.5, not of the hardware. In other words, this function will work on any Macintosh computer running System 7.5 if the system software is set up correctly and operating properly.

Most likely, what is "wrong" on some of your Macintosh computers is that File Sharing is turned on. Folder Protection will not work if File Sharing is on. When File Sharing is on the Folder Protection options in the General Controls control panel will be unavailable or "grayed out."

Check your Sharing Setup control panel to see whether File Sharing is on or off. If it is on, you will have to turn it off if you want to enable the Folder Protection features. File Sharing and Folder Protection cannot be on at the same time, you can only have one or the other. File Sharing will automatically turn off the Folder Protection features when it is turned on.

Your idea of copying the General Controls control panel to lock all of your computers System Folders will not work because the system settings will be reset

as soon as File Sharing is turned on.

System 7.5.3

With System 7.5 Version 7.5.3, if folder protection is turned on for both the System and Applications folder, these folders cannot be renamed because of the protection feature as expected. If File Sharing is now turned on, the folder protection options in the General Controls control panel become grayed out. However, the System and Applications folders cannot be renamed as if folder protection had not been turned off.

By opening the General Controls control panel, which shows folder protection boxes grayed and indicate folder protection is off, and closing the control panel, you can now rename the protected folders indicating folder protection is now off.

It appears that turning on File Sharing does not actually turn off folder protection, if it had previously been turned on. However, because File Sharing is on, opening and closing the General Controls control panel turns it off because the buttons are disabled.

Power Macintosh:Norton Utilities & Wrong Processing Speed (2/95)

Revised: 3/23/95
Security: Everyone

Power Macintosh:Norton Utilities & Wrong Processing Speed (2/95)

Article Created: 10 February 1995

TOPIC -----

I have a Power Macintosh 8100/100 and the latest version of Norton Utilities. When I run the SYSINFO utility that comes with the Norton Utilities bundle, it tells me that my Power Macintosh 8100/100 is running at 61 MHz and it performs all tests in emulation mode.

Is there something wrong with my computer?

DISCUSSION -----

In an attempt to reproduce your problem, I installed the "System Info" portion of Symantec Corporation's Norton Utilities bundle version 3.1.1, onto a Power Macintosh 8100/100. When I ran the tests, the report said that the CPU is a "PowerPC 601 @ 100 MHz", and that "all the tests were run in native PowerPC code."

You didn't specify the actual version number of the Norton Utilities software that you have. One way to tell if you have the latest version of the software is to check your original Norton Utilities disks. There should be a document named "Norton 3.1.1 ReadMe" on one of these disks.

If you have version 3.1 rather than 3.1.1, I would recommend that you upgrade to version 3.1.1 and run the SYSINFO utility again. You should then receive the correct and expected results.

Note:

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor, Symantec Corporation, for additional information.

Macintosh AV: S-Video Connector Pinouts (2/95)

Revised: 2/14/95
Security: Everyone

Macintosh AV: S-Video Connector Pinouts (2/95)

Article Created: 14 February 1995

TOPIC -----

I am trying to purchase an S-Video cable to attach a VCR to my Quadra 840AV. I noticed that the S-Video input connector on the back of my VCR has four pins and the S-Video input connector on the back of my Quadra 840AV has seven pins.

Do I need a special cable with seven pins to hook up my VCR to my Quadra 840AV?

DISCUSSION -----

The standard 4-pin S-Video connector used on most video and television equipment is functionally identical and fully compatible with the 7-pin S-Video input connector used on the Quadra 660AV, 840AV and Power Macintosh 6100, 7100, 8100 AV card.

The only difference between the two connectors is that Apple provides three additional inputs, I²C clock, I²C data, +12V, that were intended for future products and expansion.

A standard 4-pin S-Video cable available at most electronics stores will fit into the Apple 7-pin S-Video input connector without a problem. No adapter cable is necessary because pins 5, 6, and 7 are unused.

Below is a chart showing the pinouts of both the 4-pin and 7-pin connectors:

.	4-pin S-Video		Apple 7-Pin S-Video	
.	Connector		Input Connector	
.				
.				
.	PIN #	DESCRIPTION	PIN #	DESCRIPTION
.	-----		-----	
.	1	AGND (signal)	1	AGND (signal)
.	2	AGND (power)	2	AGND (power)
.	3	Video Y	3	Video Y
.	4	Video C	4	Video C
.			5	I ² C clock
.			6	+12 V
.			7	I ² C data

DOS Compatibility Card: No Support for Non-Apple CD-ROMs (2/94)

Revised: 5/24/95
Security: Everyone

DOS Compatibility Card: No Support for Non-Apple CD-ROMs (2/94)

=====

Article Created: 13 February 1995

TOPIC -----

I have a DOS Compatibility Card in my Macintosh and I want to use my non-Apple brand CD-ROM player. I talked to the vendor of the CD-ROM drive about getting MS-DOS drivers for it, and they told me that their drivers were designed for a specific SCSI controller card. What SCSI controller card is the DOS Compatibility Card emulating?

DISCUSSION -----

The Macintosh is not emulating a SCSI controller. The CDROM.SYS CD-ROM driver is not really a SCSI driver, it simply reroutes certain CDROM calls from the DOS side to the Macintosh cdrom drive. Apple wrote CDROM.SYS specifically to reroute the calls. A standard MS-DOS CD-ROM driver will not work, because it is not written to reroute the calls to the Apple CD-ROM extension.

You may be able to use parts of a CD-ROM disc by using the folder sharing feature on the CD-ROM. This is the only way to use non-Apple CD-ROM drives unless the vendor creates a specific DOS driver to transfer CD-ROM calls from the DOS side to the third-party CD-ROM driver on the Macintosh side.

PrintMonitor: Randomly Changes Order of Print Jobs (2/95)

Revised: 2/13/95
Security: Everyone

PrintMonitor: Randomly Changes Order of Print Jobs (2/95)

=====

Article Created: 13 February 1995

TOPIC -----

We are printing single and multi-copy pages of scanned images containing single and multiple instances of a 12 page document. The PrintMonitor should display the documents waiting to print in the numerical order of receipt, but sometimes, for some unknown reason, it displays documents randomly.

DISCUSSION -----

PrintMonitor lists and prints jobs in a different order than they were "received" when the total number of print jobs queued exceed approximately 39 jobs. For example, if you queue 50 print jobs, jobs 39 to 50 may not be listed and processed in the same order that they were "sent to PrintMonitor." All of the jobs will eventually print without problems; they just will not print in the order they were sent. Apple is aware of this problem and intends to fix it in a future version of software.

Problem Verified with:

PrintMonitor 7.1.2
System 7.5 (QuickDraw GX turned off)
LaserWriter 8.2f

Desktop Positioning of an External Volume (2/95)

Revised: 2/13/95
Security: Everyone

Desktop Positioning of an External Volume (2/95)

=====

Article Created: 13 February 1995

TOPIC -----

I have an external SyQuest volume that always mounts on the desktop and then displays in the middle of the screen behind open windows. This always happens even though I previously moved it to the desired place on the desktop the last time it was mounted.

There are a lot of other icons on my desktop. I have already rebuilt the desktop file. Is there some way I can control the desktop positioning of my external volume icons when they are mounted?

DISCUSSION -----

While the Finder's Desktop database file, does keep information about icon placement within windows and on the desktop, rebuilding the desktop file will not cause any change of positioning.

The grid choice of the Views control panel has affect on the method used by the Finder in displaying a mounted volume. The Finder will always position a mounted volume Icon as if snap to grid option is chosen even if it is not. If you do have the snap to grid option selected, the Finder will position icons within the confines of the Straight or Staggered grid selection you have chosen.

We suspect the problem you are experiencing is related to other Finder Desktop Icons, of which you say there are a many. The Finder will try to show a mounted disk (volume) somewhere on its invisible grid in the column of Icons at the right-most side of the display screen working down from the top. The Finder tries to locate the mounted volume icon so that there is no overlap of names on the desktop. If the name of the disk is very long, that may cause the Finder to search further to the left to avoid overlapping existing Icons.

If there are other icons in the right most column, whether they be RAM disk, Catalog, Mailbox, server volumes, floppy disks, or any file Icons, this may force the Finder to move its search for an empty display area one column to the

left and start searching from the top again, and so on further and further to the left.

One would expect the same positioning result to happen on your system, if you inserted a floppy diskette with the same name as the SyQuest cartridge or if you saved a file by that same name from an application onto the Desktop. The Finder's Icon positioning algorithm for the Desktop includes avoiding overlap with existing neighbor Icons.

Suggestions:

Step 1

Clean out the right most column of icons to make room for mounted volumes.

Step 2

Examine the next column to the left for files with long names. Shorten their names or move them further to the left, so their names do not extend into the right most column.

Step 3

Shorten the name of the SyQuest volume name.

Some combination of the above steps should clear up this situation.

Direct Dialup 1.1.1 Extension (2/95)

Revised: 2/13/95
Security: Everyone

Direct Dialup 1.1.1 Extension (2/95)

=====

Article Created: 13 February 1995

TOPIC -----

This article describes the Direct Dialup 1.1.1 extension and where to get it.

DISCUSSION -----

The Direct Dialup extension, version 1.1.1 is intended only for users who already have PowerTalk Direct Dialup 1.1 installed. Version 1.1 is a System 7.5 version only, it is not supported on System 7 Pro (7.1.1).

If you send large messages or enclosures via PowerTalk Direct Dialup Mail 1.1, you may encounter a known problem. Direct Dialup 1.1 will begin sending the letter, but it will disconnect before completing the letter. The letter will not appear in the recipients In Tray. Direct Dialup 1.1 will retry sending the letter according to the parameters set in the Direct Dialup 1.1 key in the Key Chain, without success. The letter will then be marked as "Done" in the Out Tray and you will receive a Non-Delivery Report in the In Tray. This problem has been corrected in version 1.1.1 of the Direct Dialup extension.

To use, download, double-click the downloaded file (this decompresses it). Drag the Direct Dialup extension on top of your System Folder and it will be automatically placed in your extensions folder.

DOS Compatibility Card: Connection On Banyan VINES (4/95)

Revised: 5/24/95
Security: Everyone

DOS Compatibility Card: Connection On Banyan VINES (4/95)

=====

Article Created: 13 February 1995
Article Reviewed/Updated: 24 April 1995

TOPIC -----

I want to connect my Power Macintosh 6100 with a DOS Compatibility Card to a Banyan VINES network. Is this supported on the DOS Compatibility Card? If so, what do I need to do to the CONFIG.SYS and AUTOEXEC.BAT files?

DISCUSSION -----

We have not tested the Power Macintosh DOS Compatibility Card with a Banyan Vines server because we do not have a Banyan Vines server. However, it should work if Banyan can use ODI drivers. It is important to note that this is not a DOS Compatibility Card specific issue. This is a third party software configuration problem normally handled by Banyan.

Here is a configuration that a customer has successfully used to configure the Power Macintosh 6100/DOS compatible as a Banyan client:

Step 1

The Banyan Macintosh client runs on top of NDIS and uses Ethernet II frames with a magic number of 0xBAD. So to run it with the DOS Compatibility Card, you must first set up the NET.CFG file to reflect this. The following is a sample Banyan NET.CFG file for DOS Compatibility Card.

Link Driver MACODI

```
Frame ETHERNET_802.3
Frame ETHERNET_802.2
Frame ETHERNET_II
Frame ETHERNET_SNAP
Protocol BANYAN BAD ETHERNET_II
int 6
port 300
```

Protocol ODINSUP

Bind MACODI

buffered <--- Very important, ODINSUP will not work without it.

Step 2

Run the following to set up the DOS Compatible for Banyan. This has been tested with lsl v2.05 and ODINSUP v1.22. These files are not included with the DOS Compatibility Card and must be obtained from a Novell client installation.

LSL

MACODI

ODINSUP

Step 3

Configure VINES. Include following the line in the CONFIG.SYS file.

```
DEVICE=C:\BAN\PROTMAN.DOS /I:C:\BAN
```

If you've installed the software somewhere instead of C:\BAN, substitute your directory here. The configuration file for PROTMAN.DOS is called PROTOCOL.INI. It should be in the C:\BAN directory and should contain the following:

```
[protocol manager]
```

```
drivename = PROTMAN$
```

```
[VINES_XIF]
```

```
DRIVERNAME = NDISBAN.DOS$
```

```
BINDINGS = MACODI
```

Step 4

- Run PCCONFIG, the Banyan configuration program.
- Choose the first option, "Network Card Settings".
- Choose "NDIS Ethernet."
- In the configuration screen, configure IRQ 10, driver name MACODI.
- Press F10 to save the changes.
- Choose the second option, "Login Environment Settings".
- Configure NDIS Ethernet.
- Press F10 to save the changes.

Step 5

Restart your computer, then type the following to get VINES running (from the Banyan directory, or wherever you have put it).

```
BAN /NC NDISBAN NETBIND ARSWAIT REDIR4 Z: LOGIN
```

NOTE:

Ignore the "network driver not enabled" message. This message means it is working.

Troubleshooting Hint

If you can run everything, but cannot access files on the Z: drive, make sure the protocol line is in the NET.CFG file.

Article Change History:

24 Apr 1995 - Added MACODI to list of items needed.

19 Apr 1995 - Corrected INT setting.

15 Feb 1995 - Minor typography correction.

Portable StyleWriter: Insert Sheet of Paper Message (2/95)

=====

Article Created: 13 February 1995

TOPIC -----

When I print anything on my Portable StyleWriter, I get a message telling me to insert a sheet of paper and click OK to continue. I have to do this every time I print.

DISCUSSION -----

This message is normal. One workaround to avoid this message is to select "Automatic" as the paper source in the print dialog. Normally this option is used when there is an Automatic Sheet Feeder attached, but you can select it even if you do not have one. This prevents the message from appearing.

Portable StyleWriter: Background Printing Not Available (2/95)

Revised: 2/13/95
Security: Everyone

Portable StyleWriter: Background Printing Not Available (2/95)

=====

Article Created: 13 February 1995

TOPIC -----

When I go to the Chooser, the background printing option is not available for the Portable StyleWriter. Background printing is available for all other printers. Can I print in the background?

DISCUSSION -----

Background printing on the Portable StyleWriter works differently than on other Apple printer. The Portable StyleWriter uses an application called SpoolMaster instead of the PrintMonitor for background printing. In order to use SpoolMaster, the SpoolLauncher extension must load at startup. If this extension is missing or not loaded at starutp, the background printing option is not available for the Portable StyleWriter.

Note:

Restarting with extensions off disables SpoolMaster but not the PrintMonitor.

AppleCD 300e Plus and 300i Plus: Technical Specifications (5/96)

Article Created: 13 February 1995
Article Reviewed/Updated: 17 Feb 1997

TOPIC -----

This article provides the technical specifications of the AppleCD 300e Plus and AppleCD 300i drive.

DISCUSSION -----

Technical Specifications
=====

Playback media

8- or 12-cm optical disc (any standard CD-ROM or audio compact disc is compatible)

Capacity

Mode 1: 656MB
Mode 2: 748MB

CD-audio playback

Maximum playing time: 74 minutes, 42 seconds
Frequency response: 20 to 20,000 Hz
Stereo at 44-kHz sample rate

CD-ROM playback characteristics

Average access time (1/3 stroke)
. -Normal speed (1X): 360 ms
. -Double speed (2X*): 290 ms
Data streaming rate, normal speed (1X)
. -Mode 1: 150 kilobytes per second

. -Mode 2: 171 kilobytes per second
Data streaming rate, double speed (2X)
. -Mode 1: 300 kilobytes per second
. -Mode 2: 342 kilobytes per second
SCSI bus transfer burst rate (over one CD-ROM block): 2.5 megabytes per second
Buffer size: 256K

*Note:

The symbol for increased performance—double the spin speed.

Formats supported

Multisession Kodak Photo CD
ISO 9660/High Sierra
Macintosh HFS
CD-ROM XA
CD+G
CD+MIDI
Standard audio CDs
CD digital audio data export via SCSI bus

Interfaces

- Two SCSI-2 peripheral 50-pin connectors for connection to the Macintosh and other SCSI devices (rear panel)
- Stereo audio output ports (RCA jacks) for external amplifier or amplified speakers (rear panel)
- Stereo headphone output port and front-panel volume control (external player only)

Electrical requirements

Power requirements:

—External: 100 to 240 volts AC, 50/60 Hz, 0.28 A maximum
—Internal: 5 volts DC, 350 mA maximum, 12 volts DC, 1.5 A maximum

Operating environment

Temperature:

. -External: 41° to 104° F (5° to 40° C)
. -Internal: 41° to 122° F (5° to 50° C)
Relative humidity: 5% to 90% noncondensing

Nonoperating environment

Storage temperature (6 mo.):

. -External: -22° to 122° F (-30° to 50° C)
. -Internal: 41° to 122° F (5° to 50° C)
Relative humidity: 5% to 90% noncondensing

System requirements

- A Mac Plus computer or later model
- System software version 6.0.7 or later
- A separate SCSI system or peripheral cable (not included)

Size and weight

External:

- . -Height: 2.32 in. (5.9 cm)
- . -Width: 6.22 in. (15.8 cm)
- . -Depth: 13.1 in. (32.3 cm)
- . -Weight: 5.73 lb. (2.60 kg)

Internal:

- . -Height: 1.67 in. (4.25 cm)
- . -Width: 5.83 in. (14.8 cm)
- . -Depth: 8.25 in. (21.0 cm)
- . -Weight: 2.10 lb. (0.95 kg)

Ordering Information

=====

AppleCD 300e Plus (external)

Order No. M2918LL/A

- . -AppleCD 300e Plus external CD-ROM player
- . -Installation software
- . -Multimedia Starter CD
- . -Software Dispatch CD with software samples, demonstrations, and guided tours
- . -Your choice of three free CDs from a list of best-selling titles
- . -Power cord
- . -Complete setup, learning, and reference documentation
- . -Limited warranty

AppleCD 300i Plus (internal)

Order No. M3152LL/A

- . -For use with Macintosh models with a half-height, 5.25-inch removable-drive bay. Requires an additional adapter kit and installation by an authorized Apple service provider.
- . -AppleCD 300i Plus internal CD-ROM player
- . -Complete learning and reference documentation
- . -Limited warranty

AppleCD 300i Plus Adapter Kits

=====

Note:

An adapter kit may be required to install the AppleCD 300i Plus internal player inside your Macintosh. Your authorized Apple service provider has the compatibility and adapter information necessary for the installation.

Macintosh Easy Open: Show Only Recommended Sources (2/95)

Revised: 2/13/95
Security: Everyone

Macintosh Easy Open: Show Only Recommended Sources (2/95)

=====

Article Created: 13 February 1995

TOPIC -----

Why is Macintosh Easy Open not giving me the option to select "Show only recommended sources" on my first attempt to open a document? I want this option active so that Macintosh Easy Open will filter out all the unnecessary choices.

I can sometimes select this option after opening and closing the Macintosh Easy Open control panel several times. I use it for PC files. I have DataViz translators that open the files and translate them.

DISCUSSION -----

The Macintosh Easy Open "Show only recommended sources" option is greyed out (not selectable) because the list always contains all the recommended choices when it is first opened.

The "Show only recommended sources" option is only there to try to reduce the list when it may be filled with unusual choices.

Power Macintosh: DART 1.5.3, -64 Error (2/95)

=====

Article Created: 14 February 1995

TOPIC -----

Why do I get a -64 error when launching DART 1.5.3 on my Power Macintosh?

DISCUSSION -----

This is a known issue with DART 1.5.3 on any Power Macintosh. DART version 1.5.3 does run a Power Macintosh. The error message is displayed when DART is launched, but if you click OK, DART will continue and everything works as expected. We have not experienced any problems with DART 1.5.3 on a Power Macintosh.

As an alternative to DART, we recommend using Disk Copy, with or without a third party compression utility.

LaserWriter 16/600 PS: Envelope Feeder Grayed Out (2/95)

Revised: 2/14/95
Security: Everyone

LaserWriter 16/600 PS: Envelope Feeder Grayed Out (2/95)

=====

Article Created: 14 February 1995

TOPIC -----

I just installed the envelope feeder on to my LaserWriter 16/600 PS (the same applies to a LaserWriter Pro 630 with its envelope feeder). I tried to print from the envelope feeder, but the option was grayed out in the print dialog box. How do I print to envelopes in the feeder?

DISCUSSION -----

Follow these steps to print an envelope from your LaserWriters envelope feeder:

Step 1

Make sure the printer is restarted after physically installing the Envelope Feeder. The feeder will not be recognized unless it is connected to the printer at startup.

Step 2

You must either use the LaserWriter 7.2, or LaserWriter 8.x driver. From the Chooser select one of these print drivers, select a printer, and click the Setup... button. A dialog box appears with several button options, click the Configure button. Another dialog box appears, look for the text Envelope Feeder and a pop-up menu with the options of "Not Installed" or "Installed". You will need to choose "Installed".

Step 3

For the Envelope Feeder to be available in the Paper Source pop-up menu of the Print dialog box, you must have an envelope selected in Page Setup. Many programs let you provide templates or options to print envelopes without having to select an envelope in the print dialog box.

DOS Compatibility Card: Mouse Driver for MS-DOS (1/97)

Revised: 1/6/97
Security: Everyone

DOS Compatibility Card: Mouse Driver for MS-DOS (1/97)

=====

Article Created: 15 February 1995
Article Reviewed/Updated: 6 January 1997

TOPIC -----

This article describes how to use the Macintosh mouse in the MS-DOS environment on the DOS Compatibility Card for the Power Macintosh 6100, Macintosh LC 630 DOS Compatible, Performa 640 DOS Compatible, and the PC Compatibility Cards for Power Macintosh Computers (running Windows 3.1).

DISCUSSION -----

The solution provided below is not supported by Apple Computer, and it is recommend that you contact Microsoft Corporation for the appropriate mouse driver. This solution may provide functionality until the proper mouse driver is obtained.

The MS-DOS 6.2 software, which comes with the DOS Compatibility Card, does not have drivers for any mouse pointing devices. Window 3.1, also included with the DOS Compatibility Card, does provide a driver that you can use. The driver is located on Windows Disk 4.

The driver is called MOUSEHP.CO_, and you need to copy it from the disk to your hard disk. This file is compressed, so you also need to expand the file. To expand the file, insert the "Microsoft Windows 3.1 Disket 4 of 6" and type the following command:

```
expand a:\mousehp.co_ c:\windows\mousehp.com
```

This creates the MOUSEHP.COM file on the hard disk. You can use this file from the MS-DOS Command line, or from a batch file such as the AUTOEXEC.BAT file. If you place the MOUSEHP.COM line in your AUTOEXEC.BAT file, it loads the mouse driver every time you start MS-DOS.

To test the installation of the driver, switch to the Windows directory and type "mousehp.com" at the c prompt. This will load the mouse driver into DOS.

If you would like the mouse driver to load at startup, edit the autoexec.bat file and add the line "LH C:\WINDOWS\MOUSEHP.COM"

NOTE:

MS-DOS applications must support a mouse in order to use the mouse. In some MS-DOS applications, the mouse does not look like an arrow. Instead, the mouse may appear as a square block.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Article Change History:

06 Jan 1997 - More details about testing mouse driver added.

10 Oct 1995 - Added supportability statement.

Power Macintosh: SCSI Problems Related to Cable Quality (5/95)

Article Created: 3 March 1995
Article Reviewed/Updated: 30 May 1995

TOPIC -----

I am using a Power Macintosh without an internal hard disk. Instead, I am using external hard disks. When I connect up to two hard disks, everything works without any problems. However, when I connect three or more SCSI devices, all of the devices will not mount. Changing the SCSI ID or position in the SCSI chain does not solve the problem. I am using well made third-party SCSI cables, so I don't think cabling is the problem.

DISCUSSION -----

The Power Macintosh computers have a higher performance SCSI bus which is more susceptible to noise and signal integrity than other Macintosh computers.

We have found that, in most cases, after installing all Apple brand SCSI cables and an Apple brand terminator, the abnormal behavior of the external SCSI devices is reduced or eliminated.

It is strongly recommended that Apple cables or third party cables which match Apple's double shielding (wire braid and copper sheath) be used to assure maximum performance and trouble free operation.

Power Macintosh 8100/110: No Official AV Card Support (7/95)

Revised: 7/11/95
Security: Everyone

Power Macintosh 8100/110: No Official AV Card Support (7/95)

=====

Article Created: 15 February 1995
Article Reviewed/Updated: 11 July 1995

TOPIC -----

I notice that the Power Macintosh 8100/110 does not ship with an AV video card.
Will the Power Macintosh AV video card work in a Power Macintosh 8100/110?

DISCUSSION -----

While designed to function in any Processor Direct Slot (PDS) equipped Power Macintosh computer, the Power Macintosh AV Card was never thoroughly tested in the Power Macintosh 8100/110. Therefore, Apple does not support the use of the AV card in the Power Macintosh 8100/110.

Due to the similarity of the design of the Power Macintosh 8100/80, 8100/100, and 8100/110, it is unlikely you will experience a problem when installing the AV card into a Power Macintosh 8100/110.

However, because this configuration was not thoroughly tested by Apple, we cannot officially support this configuration if a problem arises.

Power Macintosh Upgrade Card: Memory Concerns (2/95)

Revised: 2/15/95
Security: Everyone

Power Macintosh Upgrade Card: Memory Concerns (2/95)

=====

Article Created: 15 February 1995

TOPIC -----

If I install a Power Macintosh Upgrade Card in a Quadra 650 that is populated with a single 8MB SIMM, will this present a problem? I understand that the Power Macintosh requires SIMMs to be installed in pairs.

I assume the single SIMM won't be a problem because memory is addressed through the controller on the Quadra 650 logic board. Is this correct?

Also, will SIMMs that are double-sided be a problem, assuming they already worked in the Quadra 650 before the upgrade?

DISCUSSION -----

You are absolutely correct that the memory is addressed through the existing controller on the Quadra 650, or on any logic board that the upgrade card is used with.

The single 8 MB SIMM won't be a problem if it is working in the unit before the upgrade.

As long as the double sided SIMMs are non-composite, they will be fine.

Power Macintosh: Fractal Dabblers & Modern Memory Manager (2/95)

Revised: 2/15/95
Security: Everyone

Power Macintosh: Fractal Dabblers & Modern Memory Manager (2/95)

=====

Article Created: 15 February 1995

TOPIC -----

I just got a copy of Fractal's Dabblers 1.0 and installed it on my Power Macintosh running System 7.5. I installed the PowerPC code during the installation (other options were 68K and universal or fat binary).

When I attempted to launch Dabblers I got the bomb with a message saying, "Sorry, a system error occurred "Finder" floating point coprocessor not installed." The only option was Restart.

DISCUSSION -----

We spoke with Fractal Design Corporation's Technical Support about this problem. They are aware of it and state that the problem only occurs when Fractal is installed with the Modern Memory Manager turned on.

If Modern Memory Manager is turned on after installation of Dabblers, it should work correctly. In addition, Fractal's Technical Support was unsure if the problem could be bypassed by simply installing Dabblers with extensions off. When customers call with this problem, Fractal Technical Support recommends to turn off the Modern Memory Manager option in the Memory control panel AND all other extensions.

This issue is currently under investigation by Fractal, but it is believed that the problem lies in Fractal's Installer application. Fractal is using a third party installer application to install Dabblers, not the Apple Installer.

Personal LaserWriter 320: Universal Cassette Paper Sizes (2/95)

=====

Article Created: 15 February 1995

TOPIC -----

What paper sizes does the Personal LaserWriter 320 100 Sheet Universal Paper Cassette support?

DISCUSSION -----

Here are the specifications for the Personal LaserWriter 320 100 Sheet Universal Paper Cassette.

Paper Capacity: Maximum stacking height of 10mm (100 sheets of Xerox 4024 DP 20#)

Paper Sizes	Width	Length
-----	-----	-----
A4	210.0 mm (8.27 in.)	297.0 mm (11.69 in.)
US Letter	215.9 mm (8.5 in.)	279.4 mm (11 in.)
B5 (JIS)	182.0 mm (7.17 in.)	257.0 mm (10.12 in.)
Executive	184.2 mm (7.25 in.)	266.7 mm (10.5 in.)
US Legal	215.9 mm (8.5 in.)	355.6 mm (14 in.)

Paper Weights

=====

Minimum 64 gr/sq m (16.0#)
Maximum 90 gr/sq m (24.0#)

Illustrated instructions are located inside the Personal LaserWriter 100 Sheet Universal Paper Cassette demonstrating the correct procedure for adjusting the cassette.

Color StyleWriter 2400: Test Page Not Generated (2/95)

=====

Article Created: 15 February 1995

TOPIC -----

I have a Color StyleWriter 2400 printer and I cannot get it to print a test page.

DISCUSSION -----

There are two conditions where the Color StyleWriter 2400 does not generate a test page

LocalTalk Cable

=====

If you are using LocalTalk cable instead of a standard System/Peripheral 8 cable (Apple Part # M0197), the printer sends a blank page through the printer when power is applied to the printer. This is due to a sensor located in the port on the printer.

Solution:

Disconnect LocalTalk cables and use the System/Peripheral 8 cable that came with the printer

New Ink Cartridge

=====

Unlike previous versions of the StyleWriter ink cartridges, you cannot shake the Color StyleWriter 2400 ink cartridges to get the ink started.

Solution:

Listen for clicking sounds while printing the test page. Sometimes the printout looks like an imprint, or very light text. This is corrected by using the clean option available in the Utilities section of the print dialog.

Creating a Test Page

=====

1) Holding down the power button on startup until the yellow orange light comes on and then goes off.

2) Release the power button.

DOS Compatibility Card: 2 MB of RAM Corrupts BIOS (2/95)

Revised: 5/24/95
Security: Everyone

DOS Compatibility Card: 2 MB of RAM Corrupts BIOS (2/95)

=====

Article Created: 15 February 1995

TOPIC -----

After installing the DOS Compatibility Card for the Power Macintosh 6100, I received a memory error when I tried to start MS-DOS. I am sharing 2 MB of RAM from my Power Macintosh 6100. I tried using the F5 and F8 keys to bypass the AUTOEXEC.BAT and CONFIG.SYS, but they did not work. Are these keys supported?

I found a reference in the DOS Compatibility Card User's Guide that the BIOS can get corrupted using only 2 MB of memory. Can the BIOS really get corrupted?

DISCUSSION -----

Yes, the corruption of ROM BIOS is a real possibility as documented on page 58 of the DOS Compatibility Card User's Guide. If the DOS Compatibility Card only has 2 MB of RAM and the TESTMEM switch is not off, the card is unusable because the ROM BIOS becomes corrupted during the memory test.

The minimum memory requirements for the 6100 DOS Compatibility Card are at least 8 MB RAM with 2 MB shared for the PC. This is documented on page 90 of DOS Compatibility Card User's Guide. The requirements listed on the box for the DOS Compatibility Card are 4 MB for the card plus the memory required for the Macintosh OS. Since System 7.5 requires 8 MB on the Power Macintosh computers, there should be a minimum of 12 MB of RAM in a Power Macintosh using System 7.5. The memory requirements are lower when System 7.1.2 is used because 7.1.2 only require 4 MB RAM.

The F5 and F8 keys do work on the DOS Compatibility Card. You have to wait for the "Starting MS-DOS..." message to appear before you press the function keys. If the keys are pressed before this message is displayed, they are ignored by MS-DOS. Other MS-DOS computers also have this same behavior.

LaserWriter Pro 810: 802.2 Novell Ethernet Frame Types (2/95)

Revised: 2/16/95
Security: Everyone

LaserWriter Pro 810: 802.2 Novell Ethernet Frame Types (2/95)

=====

Article Created: 16 February 1995

TOPIC -----

Does the LaserWriter Pro 810 support 802.2 Novell Ethernet frame types?

DISCUSSION -----

The LaserWriter Pro 810 does not support 802.2 frame types, only 802.3 and Ethernet_II. For this printer to function in a Novell NetWare environment (and 802.2 is the default with Netware 3.12 and 4.x), the NetWare autoexec.ncf file must have an entry for one of these other protocols to support a LaserWriter Pro 810 printer.

Sound In Options: Dimmed on Some Macintosh Models (7/95)

Revised: 7/24/95
Security: Everyone

Sound In Options: Dimmed on Some Macintosh Models (7/95)

=====

Article Created: 16 February 1995
Article Reviewed/Updated: 24 July 1995

TOPIC -----

I've got a problem with a Quadra 800 and Sound Manager 3.0. When I open the Sound control panel (v. 8.0.1) and I choose Sound In, the Options button is disabled (it appears dimmed or "grayed out"). Do you know what could be causing this?

DISCUSSION -----

The Options button was added to the Sound control panel to provide a place for users to control access to sound channels and the Playthrough option. The affected models released before these options were put into use.

The systems that exhibit this behavior are:

- Performa 475/476
- Quadra 605
- Centris 610
- Centris 650
- Quadra 610
- Quadra 650
- Quadra 800

When these computers were released, the CD-ROM drive was set up to always play audio CDs through the built-in speaker (or the sound out port). The CD player was chosen as the sound source whenever the microphone was not plugged into the Sound In port. In other words, the features that you control by clicking on the Options button are controlled automatically on these systems.

There is no way to let these systems control their sound channels and playthrough options using software, like other Macintosh systems do. That is why the Options button has been disabled.

LaserWriter Pro 630: Macintosh Serial Connection (2/95)

Revised: 2/16/95
Security: Everyone

LaserWriter Pro 630: Macintosh Serial Connection (2/95)

=====

Article Created: 16 February 1995

TOPIC -----

I want to use a serial cable to connect a Macintosh to a LaserWriter Pro 630 printer. I want to use the RS-232 port (DB-9) on the LaserWriter Pro 630, does Apple have a pre-built cable for this purpose? If not can you provide me with the pinouts?

DISCUSSION -----

Depending on why you want to use a serial connection, a System/Peripheral 8 cable (Apple Part # M0197) may be a better solution. If you use the RS-232 port (DB-9) on the LaserWriter Pro 630, you cannot use the standard LaserWriter printer driver. APDA at one time provided an asynchronous printer driver, but this driver is no longer available.

If you use the LocalTalk port (Din-8) on the LaserWriter Pro 630, you can use the standard LaserWriter printer driver. This doesn't provide you with asynchronous communications to the printer, but using the standard LaserWriter printer driver is the method Apple recommends.

If you want to use the RS-232 port to use PostScript in the interactive mode, here are the pinouts:

Macintosh (Din-8)		LaserWriter Pro (DB-9)	
-----		-----	
Signal	Pin#	Pin#	Signal
GND	4	5	GND
TxD-	3	2	RxD
TxD+	6	1	DCD
HSKo	1	4	DTR
RxD+	8	NC	
RxD-	5	3	TxD

Revised: 3/23/95
Security: Everyone

Power Macintosh: Macintosh Print Pack Not Compatible (2/95)

=====

Article Created: 16 February 1995

TOPIC -----

Is the Macintosh Print Pack compatible with Power Macintosh computers or QuickDraw GX?

DISCUSSION -----

The current version of the Macintosh Print Pack is not compatible with QuickDraw GX or Power Macintosh computers. Macintosh Print Pack "may" work with System 7.5, but has not been tested.

GDT Softworks makes PowerPrint which provides the same functionality as the Macintosh Print Pack. You can contact GDT Softworks for additional information on PowerPrint. The current version of PowerPrint was tested with Power Macintosh computers.

Apple currently has no plans to update or upgrade the Macintosh Print Pack.

Color StyleWriter 2400: Extending Ink Cartridge Life (2/95)

Revised: 2/16/95
Security: Everyone

Color StyleWriter 2400: Extending Ink Cartridge Life (2/95)

=====

Article Created: 16 February 1995

TOPIC -----

Why can I only get approximately 25 pages of printing from my Color StyleWriter 2400 black ink cartridge when I print? I am trying to print some simple black and white PICT documents.

DISCUSSION -----

The number of pages that can be printed from an ink tank varies significantly depending on the type of document being printed, the mode of printing (Best, Normal, or Draft), and the type of material being printed on.

Select Best when printing requires significantly more ink than the Normal mode. Using the Best mode can cut the ink cartridge life almost in half depending on the documents being printed. When printing black and white documents it is more cost-effective and faster to print using the black-only ink cartridge (M3240G/A) because it contains a much larger supply of black ink.

Suggestions for Extending Ink Cartridges

=====

The Color StyleWriter 2400 User's Guide (page 66) contains several suggestions for extending the printing life of ink cartridges. The section reads as follows:

Ink tanks and cartridges run out of ink too quickly

To Extend the life of your ink cartridges, try the following:

- Select Draft print quality in the Print dialog box whenever you can.
- Do not clean the print head unless necessary.
- Do not print solid background colors unless necessary.
- Do not open the printer's cover unnecessarily. (After you shut the cover, the

printer cleans the print head, which uses up ink.)

- Do not unplug the printer or otherwise discontinue power frequently.
- Do not print the test page unless necessary.

Macintosh Networks: No Way to Calculate Real World Speed (2/95)

Revised: 2/17/95
Security: Everyone

Macintosh Networks: No Way to Calculate Real World Speed (2/95)

=====

Article Created: 17 February 1995

TOPIC -----

Is there a method as to how I can determine the correlation between a networking file transfer speed specification in mbits/sec and as to what I should see in a real world setting in regards to file transfer speed in mbytes/min across a given network. If this is not enough info to go on I'll be glad to supply any needed.

DISCUSSION -----

The short answer to this question is "no".

Let's take Ethernet as an example. The 10Mbps is the actual bandwidth of the cable. 40% average utilization of an Ethernet network would be considered high. At times a single node may use up to 60% of the available bandwidth but this is uncommon.

Then there are hardware and software issues. How efficient are the hardware and software? Is the data being read from disk or RAM?

There is no way to say how fast a given computer will be at doing network transfers unless you actually test it. There is no test data for Apple's Macintosh systems.

Revised: 2/17/95
Security: Everyone

LaserWriter Pro 16/600 PS: Printer Reduces Size of Faxes (2/95)

=====

Article Created: 17 February 1995

TOPIC -----

I am faxing a full length page to my LaserWriter 16/600 PS Fax printer and the printer is reducing the document by about 5-7%, is this normal?

DISCUSSION -----

Yes, a small amount of resizing is normal. The document must be resized so that the header on fax can be placed on the document properly. The width gets resized proportionally, so the document does not appear distorted. The overall reduction is approximately 5%.

Pwr Mac DOS Compatability Card: VTCPIP Error w/ Windows (2/95)

Revised: 5/24/95
Security: Everyone

Pwr Mac DOS Compatability Card: VTCPIP Error w/ Windows (2/95)

Article Created: 17 February 1995

TOPIC -----

I have installed LAN WorkPlace for DOS on my DOS Compatibility Card for the Power Macintosh 6100. Now when I restart the MS-DOS environment and try loading Windows I get the following error message:

VTCPIP: Device load failed.
TCPIP is not installed or not the right version.
hit any key to continue.

Despite this error, Windows seems to load properly.

DISCUSSION -----

This error occurs if you have installed the Windows portion of LAN Workplace. If Windows runs before TCPIP.EXE is loaded, you get this error. This error doesn't prevent Windows from loading and working properly, however your TCP/IP software will not work.

The most common cause of this error is running Windows before loading network software. You may encounter this error because the CALL C:\LANWP.BAT is added as the last line of the AUTOEXEC.BAT file. Apple ships the DOS Compatibility Card with WIN as the last line in AUTOEXEC.BAT. To correct this error, move WIN after CALL C:\LANWP.BAT, or comment it out altogether.

If you have further questions about Microsoft Windows, please contact Microsoft's technical support. If you have further questions about LAN Workplace for DOS, please contact Novell.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

DOS Compatibility Card: How to Access Upper Memory (5/96)

Revised: 5/22/96
Security: Everyone

DOS Compatibility Card: How to Access Upper Memory (5/96)

Article Created: 17 February 1995
Article Reviewed/Updated: 22 May 1996

TOPIC -----

I have a Power Macintosh 6100 with a DOS Compatibility Card installed. I am unable to get EMM386 working. The user's manual discourages the use of memory management tools, so I'm wondering if the DOS Compatibility Card supports EMM386? If so, how do I get it working?

DISCUSSION -----

The DOS Compatibility card supports upper memory. To access upper memory make the following change to your config.sys file:

If you are using PC Setup 1.0.7, the lines are:

```
DEVICE=C:\DOS\EMM386.EXE NOEMS X=C800-CFFF RAM=D000-EFFF
```

or

```
DEVICE=C:\DOS\EMM386.EXE X=C800-CFFF RAM=D000-EFFF
```

For PC Setup 1.5, the command lines are:

```
DEVICE=C:\DOS\EMM386.EXE NOEMS I=CA00-CBFF X=CC00-CFFF RAM=D000-EFFF
```

or

```
DEVICE=C:\DOS\EMM386.EXE I=CA00-CBFF X=CC00-CFFF RAM=D000-EFFF
```

Depending on how you have configured the file, config.sys should look similar this:

```
DEVICE=C:\DOS\SETVER.EXE  
DEVICE=C:\DOS\HIMEM.SYS /TESTMEM:OFF
```

```
DEVICE=C:\DOS\EMM386.EXE X=C800-CFFF RAM=D000-EFFF  
DOS=HIGH,UMB  
FILES=30  
LASTDRIVE=M
```

This information is also provided in the DOS Compatibility Card Read Me File.

Article Change History:

22 May 1996 - Added new config.sys line for PC Setup 1.0.7

Apple SCSI Terminator: Description of Active Terminator (2/95)

Revised: 2/23/95
Security: Everyone

Apple SCSI Terminator: Description of Active Terminator (2/95)

=====

Article Created: 23 February 1995

TOPIC -----

This article provides a description and some Q and A information for the new Apple Active SCSI Terminator part number M3503LL/A.

DISCUSSION -----

The Apple SCSI Active Terminator is the new style of SCSI terminator. It replaces service part number 658-8032, the new service part number is 922-1185.

Question: What does it do?

Answer: The Apple SCSI Active Terminator includes a voltage regulator and capacitors to filter the term power. Active termination is one of the alternatives specified in the new SCSI specifications. The active termination is much less sensitive to variations in the termination power supplied by various SCSI devices.

The active terminator functions as follows:

The terminator voltage supplied by the device, typically between 4.25 Vdc and 5.25 Vdc is applied to a low drop voltage regulator and the output is regulated to 2.85 Vdc which is then applied to 110 ohm series termination resistors.

Question: Does it turn off or turn on?

Answer: No, the regulator is on when ever termination power is supplied to it.

Question: Why isn't there a LED on it indicating activity?

Answer: A complete redesign of the tooling for the terminator housing would be required to fit an LED to the terminator. Since the terminator is at the back of the peripheral, out of sight of the user, the benefit of an LED would be minimal.

Question: Does it adjust for resistance or impedance problems?

Answer: No, its designed for regulating the termination power supplied by SCSI devices.

Question: Why would someone want this one over the old one?

Answer: Improved reliability of the term power signal level.

Question: Did the finished goods part number change to a /B?

Answer: No, this is the first revision of this part, not a revision of the old part. The new part number is M3503LL/A

Question: How can I differentiate it from the old terminator from the outside?

Answer: The previous non active SCSI terminator has part number 590-0304-A embossed in the plastics. The new active SCSI terminator has part number 590-0772-A embossed in the plastics.

Question: Is it required by any current or future computers?

Answer: This new active SCSI terminator is not required for any specific computer or peripheral from Apple. It is a replacement for the current terminator. The IIIfx and some LaserWriter printers still require the black terminator.

Article Reviewed/Updated: 26 April 1995

TOPIC -----

Is there a outward way to differentiate between the backlit and original Macintosh Portable? I know I can open the rear cover and look at the memory configuration since the Backlit Portable has fewer memory chips on the left side of the logic board, but can I identify them from the outside?

DISCUSSION -----

The easiest way to tell the difference between a backlit and non-backlit Portable is, of course, to see if there is a light emanating from the display.

Another way to tell is to check the model number, located on the bottom of the unit. The Backlit Portable was model number M5126 and the non-backlit was M5120.

Note: If the non-backlit model had an upgrade to the backlit, it would retain the old model number, M5120 and have the backlight upgrade card installed in the J10 ROM slot and have inprinted on it "PORTABLE BACKLIGHT UPGRADE".

Article Change History:
26 Apr 1995 - Added more info on how to differentiate between models.

Drive7: Compatibility with Power Macintosh and System 7.5 (2/95)

=====

Article Created: 20 February 1995

TOPIC -----

What version of Drive7 should I use on my Power Macintosh? Is it System 7.5 compatible?

DISCUSSION -----

Casa Blanca Works, makers of Drive7, strongly recommend that customers use at least version 3.0 of Drive7 for full Power Macintosh compatibility.

They stated that there are known Power Macintosh compatibility issues with Drive7 versions previous to 3.0. The current version of Drive7 is 3.0.9. Version 3.0 and later is also System 7.5 compatible.

System 7.5: Recovering Deleted Text from Stickies (2/95)

=====

Article Created: 20 February 1995

TOPIC -----

I saved some important info using the Stickies DA and then I accidentally deleted it. Is there any way to get it back?

DISCUSSION -----

Stickies supports the Undo command from the Edit menu. If you accidentally delete text, this is the only reliable way to retrieve it. Note that the Undo command will only undo the last text editing task.

Apple Personal Diagnostic: False Directory Problem Report (2/95)

Revised: 2/20/95
Security: Everyone

Apple Personal Diagnostic: False Directory Problem Report (2/95)

=====

Article Created: 20 February 1995

TOPIC -----

Apple Personal Diagnostics reports a disk or directory problem with my hard disk, but when I run Disk First Aid, no problems are found.

What is causing this contradiction?

DISCUSSION -----

Under some circumstances, Apple Personal Diagnostics may incorrectly report disk or directory problems, but drive diagnostics such as Disk First Aid may not find these problems. This situation is usually caused by extension conflicts with the diagnostics.

For best results, when running Apple Personal Diagnostics, disable Extensions by holding down the Shift key at start up, then run the diagnostics.

Tech Info Library: How to Search for Articles (2/97)

=====

Article Created: 22 February 1995
Article Reviewed/Updated: 12 Feb 1997

TOPIC -----

The following discussion gives an overview of the use of the Technical Information Library, keywords, constructing searches, and relevance ranking.

For a description of how to submit an article for publication, refer to the article titled "Tech Info Library: Submitting Articles for Publication".

DISCUSSION -----

=====

THE TECHNICAL INFORMATION LIBRARY

=====

What Is The Technical Information Library?

=====

The Apple Technical Information Library (TIL) is Apple's official technical support database. The TIL is a textual database of several thousand articles about Apple and third-party product technical issues. The TIL is accessible by thousands of users world-wide on online services such as CompuServe, and the Internet (both World Wide Web and WAIS). The TIL is updated daily with new information and is the same database that Apple employees use to answer customer questions.

Where You Can Find the TIL

=====

A subset of the TIL is available to anyone through these online services:

America Online

..TIL17225-Tech_Info_Library-How_to_Search_for_Articles_2-97.pdf

Use your AOL Web Browser to visit: <http://til.info.apple.com>.

CompuServe

Located in the Apple Tech Info area (go aplttil).

The Internet

Maintained in two locations:

info.hed.apple.com (Home Gopher Server)

Path: Home Gopher Server -> Computer Information -> Apple Tech Info Library

info.apple.com

World Wide Web

Located at this URL: <http://til.info.apple.com> OR <http://www.info.apple.com>

SEARCHING THE TIL

=====

There are four ways to search the TIL:

- By keyword
- By full text search
- By publication date (CompuServe -- See NOTE*)
- By browser

*NOTE: This search varies slightly between platforms. See the specific platform section below for information on searching by date.

Searching with Keywords

=====

Use keywords to quickly and easily find the information you are looking for in the TIL. For best results, use a keyword and a product name. Here is an example of using a keyword and product name in a search string:

"SPECSHT and Quadra 840AV"

This search string finds the "Quadra 840AV: Specifications" article.

Using a keyword in a search string may not find all relevant articles; some articles were in the TIL prior to the implementation of keywords. In addition, some related articles do not include the keyword for the article to which it relates.

The keywords in the following list can help you easily narrow a search. This list is current as of 12 February 1997:

Begin_Table

Description -----	Keyword -----
Apple MessagePad (Newton)	knmp
Apple Network Administrator Toolkit	kanat
At Ease Information	katease
Available in rich text via FAX	kfax
Cable Information	cabinfo
Document Manual Errors	kmanerr
Emerging Issues	kissue
Engineering Feedback Pilot Program	kfeed
Frequently Asked Questions (FAQ)	kfaq
Information Alley	kalley
Internet Related Information	kinter
Matrix/ Table	ktable
Online Information	kol
PCI Bus Related Articles	kpci
PowerBook	kpbook
PowerPC, Power Macintosh	kppc
Searching Libraries/Posting Articles	khelp
Software or Hardware Configuration	cnfg
Specification Sheets	specsht
Support Issues	supt
System 7.0 Articles	sys7
System 7.5 Articles	sys75
System 7.6 Articles	sys76
Third Party Compatibility Lists	pcompat
Third Party Info	3pty
Top 20 Most Accessed Articles/Month	ktop20
Top TIL articles read in Internet TIL	ktoptil
Troubleshooting: Hardware	hts
Troubleshooting: Network	knts
Troubleshooting: Software	ksts
Windows/MS-DOS	kwindows

End_Table

Entering Text Queries
=====

You can search the TIL by simply typing in a word or phrase and then clicking the Search button. A list of all articles that contain the word or phrase you entered displays in a scrolling field. You can then double-click on an individual title to view the article.

Spell Correctly

To ensure a complete search, it is important to spell correctly. Products are indexed into the TIL by their full name. Capitalization and trademark symbols are not necessary.

Use Full Product Names

When making searches, it is important to use the full product name. For a complete listing of all Apple product names, see the Apple Computer, Inc. Trademark List. This can be located by searching the TIL using "trademark list" as the search information.

Use Full Search Phrases When Appropriate

It is possible to use a full search phrase when searching the TIL. For example: searching for "color stylewriter pro" finds all articles that contain the exact phrase "Color StyleWriter Pro". (Note: for all example search strings shown, do not type the quote marks [","]- they used in this article only to identify the specific search string.)

Searching Tips

When you do not know an exact phrase, use operators such as AND, OR, or NOT* (except in the Internet WAIS-based TIL) between words to expand or limit your search. For example, typing in "PowerBook and Printer" gives you a listing of all articles that contain the words PowerBook and Printer anywhere in the document. If you are looking for information on toner cartridges for a LaserWriter, typing the search string "laserwriter and (toner or cartridge)" finds every document that includes the words LaserWriter and toner or the words LaserWriter and cartridge.

*Search Tip for WAIS-based Tech Info Library

An important tip to remember when searching the WAIS-based Tech Info Library (<http://til.info.apple.com>) is that the database does not understand AND, OR or NOT. Thus, if you search for either "MessagePad and 120," or "MessagePad OR 120," the result is all articles that contain either Messagepad or 120. Thus, try using keywords or very specific terms (example: 5200) as well as limiting the number of article titles found (40 is the default, up to 100) when searching.

Relevance Ranking of Articles

=====

The theory of relevance ranking is that it matches your search words against the textual content of selected information sources to find articles that match the search request. A statistical algorithm then ranks the articles according to relevancy and displays the most relevant article(s) at the top of the hit list. As a result, you can see at a glance which articles are most relevant. Relevance ranking helps you find more pertinent information with less effort.

=====

THE TIL ON COMPUSERVE

=====

This section describes the differences in searching the TIL on CompuServe. You can search the TIL on CompuServe in three ways:

- By product category
- By Publication date
- By full text search

You can perform a search using one or a combination of these methods.

We recommend using "Full Text Search" in your search (alone or in combination with one or both of the other methods). Although searching requires more time, in many cases you get more matches based on your search criteria.

Searching on CompuServe =====

The following instructions assume that you are using CIM (CompuServe Information manager) software. (If you are using the text mode, please type the number next to the appropriate line item.)

Step 1: Type "Go APLTIL" to access the main search screen for the TIL.

Step 2: Select "Search the Apple Technical Information Library"

Step 3: Complete Step 3 as described below for the type of search you want.

Step 4: Complete Step 4 as described below for the type of search you want.

The remaining search steps follow the separate Step 3 and Step 4 procedures. To perform a combination search, complete Step 3 and Step 4 for each desired type of search before continuing with Step 5.

Searching by Product Category -----

Step 3: Select "Product Category."

Step 4: Select the product category you want to search:

- Any Product Category
- AppleTalk
- A/UX
- HyperCard
- LaserWriter
- Newton
- Performa
- PowerBook
- Power Macintosh
- Quadra
- System 7

Searching by Publication Date -----

Step 3: Select "Publication Date."

Step 4: Select the date specification and enter the search date in MM/DD/YY format. The date specifications are:

- Any Date
- On or After a Specific Date
- On or Before a Specific Date

Searching with Full Text

Step 3: Select "Full Text Search"

Step 4: Enter the word or words you want to search for. You can enter all words in the first of the three available rows, which results in a search for the exact string. You can enter words in different rows, which results in a search for the specified words in any order (in other words, the multiple rows provide an "and" function). For example: Entering "Power Macintosh printing" on the first row searches for this exact string; entering "Power Macintosh" on the first row and "printing" on the second row searches for an article that includes the two strings "Power Macintosh" and "printing" somewhere in the article. (CompuServe does not support boolean "or" or "not" type searches.)

Step 5: The Apple Tech Info Library performs the search and reports the results labeled "Records selected: nnn".

Step 6: Select "Display Selected Records" to view all article titles of articles found in the search.

Step 7: Select individual article title(s) to view the article(s).

Article Change History:

12 Feb 1997 - Added keyword sys76
11 Jul 1996 - Added new keyword kanat.
10 Jul 1996 - Added keyword.

GPi and Super-Fast Modems: Overview (2/95)

Revised: 2/21/95
Security: Everyone

GPi and Super-Fast Modems: Overview (2/95)

Article Created: 21 February 1995

TOPIC -----

This article describes the GPi (General Purpose input) line of the serial port on a Macintosh computer and how it works with super-fast modems.

DISCUSSION -----

What is GPi?

=====

GPi is a signal pin that is used on the serial connector of a DIN-8 (DIN-9 on Geoport enabled Macintosh computers). It was intended to provide a way for the Macintosh to support communication devices that needed to pass along pacing information (an external clocking signal).

This signal was typically needed several years ago by modems that were synchronous serial modems. This "class" of modems is typically used for specialized purposes, as into tying into certain computer data networks or directly into a remote communications controller.

Today, the vast majority (98% or better) of personal computer remote communications are done via asynchronous modems. The need for GPi to be used as a synchronous external clock input is rare. Asynchronous serial modems today go as fast as 28,800 bps over the communication link, and if the data going over that link is highly compressible, it is theoretically possible that the actual data rate (because of the gain in compression) can approach 115,000 bps.

However, there is a more practical use for the GPi control line - hardware handshaking. Hardware handshaking is a method of signaling used between hardware devices (computer and modem) to pace the "conversations" over the serial line to help ensure that characters and other information do not get "dropped". Typically speaking, most Macintosh computers that are communicating serially to a modem only require a special cable called a "high speed hardware handshaking cable" to speak at serial port speeds of 9600 bps or higher.

In Macintosh computers that support the GPi connection, the GPi line goes to the "Data Carrier Detect" or DCD signal line of the serial control chip. It is located at pin 7 on the DIN-8 serial connectors, and connects to the DCD input of the Z8530 Serial Communications Controller (SCC). Some machines that do not support GPi include the Macintosh Plus, Macintosh Classic, and Macintosh LC. On these machines, pins 7 of the DIN-8 serial connectors are not connected.

There is no one correct way to institute a hardware handshaking protocol as it relies heavily on a combination of events: the software requiring serial communications, the cable used to connect the computer and the external serial communications device (typically a modem of sorts), and the communications device itself (again, typically a modem).

In Macintosh software, the choice of using GPi is up to the programmer of the software. The software producer should tell you in the documentation whether their software relies on GPi and other configuration information. In most Macintosh serial communications software, the use of GPi is minimal or non-existent.

A few Macintosh computers (such as the Macintosh IIfx and Macintosh Quadra 950) are exceptions to certain hardware trends and require the use of special compatibility software to allow the use of communications software that require GPi control.

GPi signal use can be instituted to allow for one form of Hardware handshaking control. However, the use of the GPi line is not required for the use of other hardware handshaking control schemes on the Macintosh. In fact, many "Super High Speed" modems do not use GPi to hardware handshake.

Can you use a "high Speed" modem with your Macintosh?

=====

Yes, you can use a "Super High Speed" modem for your Macintosh. The general technical classification for these modems are:

- V.32 for 9600baud
- V.32bis for 14,400
- V.32ter for 19,200
- V.34 for 28,800

The data rate specified is typically the best data for that class of modem (for example, V.32 will never go faster than 9600, but it can communicate at 4800, 2400, and 1200 baud speeds) taking into account certain factors like quality of telecommunications line, how much "attention" your Macintosh can pay to the serial line, and other tasks that it needs to be doing at the same time.

In fact, for most Macintosh computers that are not equipped with the Geoport capability, the fastest ideal speed that you can expect the computer can speak at the serial connector is 57,600 bps. Geoport-equipped Macintosh computers can potentially go up to 230Kbps at the serial port.

Further Reference

PowerBook: Jumpy or Erratic Trackpad Operation (2/97)

Article Created: 21 February 1995
Article Reviewed/Updated: 21 February 1997

TOPIC -----

The cursor on my PowerBook keeps jumping or moving where I do not want it to without my touching it. It also acts strangely when I do touch it. I have tried cleaning both the Trackpad itself and my finger, using a tissue between my finger and the Trackpad.

I am not wearing any jewelry, using any hand lotion, or sweating a lot from my hands. Also, the Trackpad reacts the same way with any one of the many different people who use this computer. What else could be wrong?

Is there something wrong with the Trackpad or am I doing something wrong?

DISCUSSION -----

The trackpad on the PowerBook 190, 500, 2300, 1400, 3400*, and 5300 series computers works on a principal called coupling capacitance. As your finger moves over the surface, the trackpad evaluates the change in capacitance between two layers of measurement electrodes built into the surface of the trackpad.

Make sure only one part of your finger is touching the pad. You will not be able to use a pen or other object, it is designed to work with your finger. Also make sure that you are not resting your wrist on or very close to the pad. The trackpad may interpret this as your wrist touching it and make the cursor move in that direction. If you suspect either of these is causing the cursor's behavior, try raising your wrist in the air and only touch the pad with the tip of your finger. If the symptom goes away then you know that one of the above is the cause and you should adjust the position of your wrist and or finger.

If you have sweaty hands or if moisture collects on the pad, this may also confuse the trackpad. Wiping off the trackpad with a cloth or tissue will usually fix this problem. If the problem goes away when a piece of paper is put in between the finger and trackpad you may want to consider purchasing a Teflon

applique to fit over the pad to prevent the moisture from having direct contact with the trackpad. Before installing the Teflon applique, make sure the trackpad is clean and dry. You can use a mild glass cleaner sprayed onto the cloth, not onto the trackpad itself to clean the trackpad. If the problem is still happening with a piece of paper in between the finger and trackpad try removing the trackpad preferences from the Preferences folder in the System folder.

Oil or lotion can also cause the same problem. Either do not use hand lotion, or consider purchasing a Teflon pad to protect the trackpad. Before installing the Teflon pad, make sure the trackpad is clean and dry.

Jewelry may also cause interference. Try removing rings or bracelets and see if the jumping or erratic behavior disappears.

Apple has had some reports of the strange behavior you describe about power supplies made by a company called Battery Technology, Inc. (BTI)**. If you are using one of these power supplies, unplug it and try running from just the Apple NiMH battery to see how the Trackpad behaves. Also try using the Apple AC Adapter instead of the third-party AC Adapter. If the Trackpad behaves normally running from just the Apple battery or with the Apple AC Adapter, there is most likely a problem with your third-party power supply.

* Note: The trackpad used in the PowerBook 3400 series computers was designed to be much more tolerant than previous models of moisture and other environmental factors. The issues mentioned in this article should have little or no impact on this redesigned and improved trackpad.

** This article provides some information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the third-party vendor for more information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

This article is one of many available through the Apple Fax center. For a complete list of available Fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Chinese Language Kit v1.1 Full Custom Install (2/95)

Article Created: 21 February 1995

TOPIC -----

What is the difference between a Simplified Custom install and a Traditional Custom Install of the Chinese Language Kit v1.1?

DISCUSSION -----

Listed below are the software components and the hard disk space they require that are installed onto a hard disk from Chinese Language Kit v1.1 using the Customize button in the Installer and selecting all the options. Both the Simplified Installation and Traditional Installation are shown here.

NOTE:

The items installed for the Chinese Language Kit v1.0 are the same as v1.1 listed below, but the version numbers of the items may vary.

Power Macintosh Upgrade Card: Blank Desktop at Start Up (2/95)

Revised: 2/21/95
Security: Everyone

Power Macintosh Upgrade Card: Blank Desktop at Start Up (2/95)

=====

Article Created: 21 February 1995

TOPIC -----

After installing Power Macintosh Upgrade Card in my Centris 650, my extensions load properly on startup but the desktop comes up blank.

Restarting in 68040 mode works fine. What is the problem?

DISCUSSION -----

If you have a Radius Lemans GT card installed, you will need to reconfigure the card properly to match the Power Macintosh hardware (after switching to PowerPC mode) by holding down the letter "u" on startup.

You may wish to contact Radius should the problems persist.

To locate a vendor's address and phone number, use the vendor's name as a search string in the Tech Info Library.

Express Modem and PBX System Compatibility (2/95)

Revised: 2/21/95
Security: Everyone

Express Modem and PBX System Compatibility (2/95)

=====

Article Created: 21 February 1995

TOPIC -----

Can I plug a PowerBook 14.4 Express Modem or Duo 14.4 Express Modem into a PBX phone system?

DISCUSSION -----

From the "Macintosh Express Modem User's Guide":

- Preface, page ix - The PowerBook Duo 14.4 Modem and PowerBook 14.4 Modem will not work with party lines, cannot be connected to a coin-operated telephone, and may not work with a digital private exchange (PBX) system.
- Chapter 1, page 4 - To use your Express Modem, you need an ANALOG telephone line. Most hotels and other buildings use an exchange system (PBX) with digital extensions. If the office or hotel room has a digital extension, consult the office telephone manager or telephone service provider to determine if an analog line can be installed.

CAUTION: Be sure to request an analog telephone line, because higher voltage than recommended may cause damage to your Express Modem, and the repair will not be covered under warranty.

LaserWriter 16/600 PS: HP/UX PCL Printing Over TCP/IP (2/95)

Revised: 2/21/95
Security: Everyone

LaserWriter 16/600 PS: HP/UX PCL Printing Over TCP/IP (2/95)

=====

Article Created: 21 February 1995

TOPIC -----

I have a LaserWriter 16/600 PS connected over the network to an HP/UX 9.0.x computer. I followed the instructions in the LaserWriter manual to configure the printer under HP/UX and everything prints fine, except I need to print reports from an application in landscape format.

What's the best way to configure the printer so it can take full advantage of landscape mode? Should I set it up as a HP LaserJet using PCL?

DISCUSSION -----

To print to a LaserWriter 16/600 from HP/UX, you configure the printer to either auto-select, or use PCL emulation over TCP/IP.

You seem to have set up the printer queue correctly via "sam" on the HP workstation. However, to print a PCL print job from your workstation in landscape mode, you need the correct escape sequence to specifically tell the printer how to set the print job output. Use of the "lp" or "rlp" command will not make a difference.

To set the correct escape sequence to print in landscape mode, you have to know how to embed an escape sequence in a PCL job. For example, /etc/hosts tends to be an ASCII file, and you can create ASCII files like /etc/hosts, then embed the escape code in the beginning of the text. Below is the escape sequence:

^[&l10

- The symbol "^", a carrot, in "vi" requires holding down the CONTROL-key and letter "v" at the same time.

- The symbol "[", an open bracket, can be obtained by holding down the CONTROL-key and the "{/[" key at the same time.

- The symbol "&" is SHIFT-7.
- The "l" is the lower-case letter "L".
- The "1" is a numeric one
- The "O" is upper-case letter "O"

Personal LW NT: LaserJet Emulation Page Layout Codes (2/95)

Revised: 2/21/95
Security: Everyone

Personal LW NT: LaserJet Emulation Page Layout Codes (2/95)

=====

Article Created: 21 February 1995

TOPIC -----

I'm trying to use a Personal LaserWriter NT to print reports from our DEC VAX via a serial port.

The printer responds to our requests. However, it prints in a font that is too large to have all the text appear on the page. I'm not sure if it is related to the communication software, VAX print que, or the NT settings. I've tried using the printer's HP LaserJet and Diablo settings, same result. I have tried modifying printer settings in the software, same result.

I've been told that I need to set the printer to 66 lines of output. I don't really know what this means. Any words of wisdom?

DISCUSSION -----

There are at least two parameters that need to be changed (Lines per page and character size) to achieve the page layout that you want. Optionally you may need to set top and bottom margins. To do this in LaserJet emulation you need to pass certain escape sequences to the printer to change these parameters.

If you do not have access to a text/binary editor such as EDT, request your MIS department to send the following information to the printer.

Commands

Page length:

ESC&1#P # = NUMBER OF LINES PER PAGE
ESC&1#E # = NUMBER OF LINES AT TOP MARGIN
ESC&1#F # = NUMBER OF LINES AT BOTTOM MARGIN

Font Selection:

ESC(s7C 7 point character size
ESC(s8C 8 point character size
ESC(s8.5C 8.5 point character size
ESC(s10C 10 point character size
ESC(s12C 12 point character size
ESC(s14.4C 14.4 point character size

LaserWriter Pro 630: Virtual Memory Error (2/95)

Revised: 2/21/95
Security: Everyone

LaserWriter Pro 630: Virtual Memory Error (2/95)

Article Created: 21 February 1995

TOPIC -----

I have a LaserWriter Pro 630 with 8MB of RAM being used in a school lab on an Ethernet network. Occasionally the printer displays a virtual memory error when documents are printed that use TrueType fonts not present on the printer. If I reset the printer, every works fine. Later in the day however, the error may reappear. Why?

DISCUSSION -----

You are getting the virtual memory error because the printer is running out of memory. Even with 8MB of RAM, the majority of it is taken up by the page buffer (especially with PhotoGrade or 600dpi). Power-cycling the printer clears out all temporary items in memory such as fonts, so it is not surprising that the print jobs work for a while, and then fail again once the fonts fill up memory.

Since it seems that you are downloading quite a few fonts to the printer, we would suggest enabling "Unlimited Downloadable Fonts" in the Page Setup Options dialog. This option purges each font from the printer's memory after it is used. As a result, print jobs will probably take longer to process, however, this should get rid of the PostScript errors.

If you will be constantly downloading fonts to the printer, you might want to purchase additional RAM, or even a hard drive for the printer to store the TrueType fonts.

Pwr Mac DOS Compatibility Card: LSL.COM Not Included (2/95)

Revised: 5/24/95
Security: Everyone

Pwr Mac DOS Compatibility Card: LSL.COM Not Included (2/95)

=====

Article Created: 21 February 1995

TOPIC -----

I have a DOS Compatibility Card for the Power Macintosh, I am trying to use it on a network. Our support personnel keeps asking me for a link support layer LSL.COM. Where can I get this?

DISCUSSION -----

LSL.COM is part of Novell Netware client software. If you are running a Novell Netware network, the distribution disks will have LSL.COM. If not, you can get LSL.COM from Novell's ftp site (ftp.novell.com) or by calling Novell and ordering a site-license.

Color StyleWriter Pro: Margin Limitations and Solutions (2/95)

Revised: 2/21/95
Security: Everyone

Color StyleWriter Pro: Margin Limitations and Solutions (2/95)

=====

Article Created: 21 February 1995

TOPIC -----

I have a Color StyleWriter Pro and when I print to it from various applications, it seems that all of the margins are offset from what I specify in the application. As an example, the top margin seems to be offset anywhere from 1/8-in. to 3/16-in. so the entire page is moved up towards the top by that amount.

DISCUSSION -----

There are some known problems with the margins on the Color StyleWriter Pro printer. We have outlined some workarounds below.

With the right and left margins, the printable area of the page is offset from the center. The driver does its best to inform applications of this offset, however, applications that do not use the information provided by the driver and assume the page is centered produce incorrect margins.

Top and bottom margins will typically be from 1/8-in. to 3/16-in. off (moved toward the top of the page). This problem is due to the hardware limitations of the printer, specifically, with the paper roller mechanism. The best workaround for this issue is to add 1/8-in. or 3/16-in. to the margin when specifying this value in the application's margin settings.

Apple EtherNet AUI Adapter: Not FCC Certifiable (2/95)

Revised: 2/21/95
Security: Everyone

Apple EtherNet AUI Adapter: Not FCC Certifiable (2/95)

=====

Article Created: 21 February 1995

TOPIC -----

I noticed that the Apple Ethernet AUI Adapter does not carry any FCC labeling to indicate that it has been tested and certified by the FCC. Is the AUI adapter certified by the FCC?

DISCUSSION -----

The Apple Ethernet AUI Adapter is considered a power supply by the FCC and is NOT certifiable. The device is within the FCC Class A limits for emissions but it does not require certification nor the FCC label. The FCC will not certify this type of device.

The Apple Thin Coax transceiver is a Class B compliant device and carries both the FCC ID and the FCC 'interference' statement.

The Apple Ethernet Twisted-Pair Transceiver is a Class A compliant device and is required only to carry the FCC 'interference' statement and does not require its own FCC ID.

Retrospect: How To Interpret Performance Shown in Log (2/95)

Revised: 2/21/95
Security: Everyone

Retrospect: How To Interpret Performance Shown in Log (2/95)

=====

Article Created: 21 February 1995

TOPIC -----

Please clarify the way Dantz Development Corporation's Retrospect software computes its throughput in this example:

8:56:53 AM: Copying
8:57:00 AM: Comparing
8:57:04 AM: Execution completed successfully

Total Completed: 31 files, 861 KB
Performance: 4.5 MB/minutes (7.2 copy, 12.6 compare)

DISCUSSION -----

The log gives the impression that the copy took 7.2 seconds and the compare took 12.6 seconds. This is not correct. These times are instead accumulative. In other words, after 7.2 seconds the copy was completed and after 5.4 more seconds the compare was completed.

Here are the calculations used to get the number above:

Duration: 00:00:11
Throughput = kbytes backed up / duration
4.5 MB/minute = 861 KB/11 sec * 60 sec / 1 minute * 1 MB/1000 KB
7.2 MB/minute = 861 KB/7.2 sec * 60 sec / 1 minute * 1 MB/1000 KB
9.9MB/minute = 861 KB/5.2 sec * 60 sec / 1 minute * 1 MB/1000 KB

Note:

The total performance is based on the total time of the backup and compare procedures. If you compute just backup or compare time, you seem to have a higher throughput.

Macintosh Easy Open and Generic System File Icons (2/95)

Revised: 2/21/95
Security: Everyone

Macintosh Easy Open and Generic System File Icons (2/95)

=====

Article Created: 21 February 1995

TOPIC -----

Since I installed System 7.5, both the Finder icon on the System Folder and the System icon in the About this Macintosh window are showing up as a generic document icons (a little piece of paper with the upper left corner folded over).

Everything seems to function normally. I have already rebuilt my desktop with extensions off, but that did not change it. How can I fix this?

DISCUSSION -----

Make sure that Macintosh Easy Open is the first control panel to load before all other extensions and control panels. You can do this by adding a space before the control panel's name so, instead of "Macintosh Easy Open" the name will be " Macintosh Easy Open".

If this does not correct your problem, you may need perform a clean installation of the System software.

Display Card 24AC: Power Macintosh Can Use Acceleration (2/95)

Revised: 2/22/95
Security: Everyone

Display Card 24AC: Power Macintosh Can Use Acceleration (2/95)

=====

Article Created: 22 February 1995

TOPIC -----

I installed v1.2 of the Display Card 24AC software, which is compatible with Power Macintosh systems, but I cannot find the acceleration options in the Monitors control panel. Is acceleration available on Power Macintosh computers?

DISCUSSION -----

There should be no problems using the Display Card 24AC with any Power Macintosh computer that has an available NuBus slot.

The icons which allow Power Macintosh users to activate video acceleration on the Display Card 24AC should appear in the Options section of the Monitors control panel under the following conditions:

- A Display Card 24AC is installed in the Power Macintosh, and a monitor is attached to the card.
- The "Apple Macintosh 24AC" file is in the Control Panels folder of the current System Folder. The installer for the Display Card 24AC places this file in the Control Panels folder automatically.
- The monitor that is attached to the Display Card 24AC is selected in the Monitors control panel, before the "Options" button is selected. The top left corner of the Options window should read "Apple Macintosh 24AC".

Any time the icons which allow you to activate video acceleration are not visible, video acceleration has not been activated for that monitor.

If the acceleration option is not available, verify all the conditions listed above. If you meet these conditions, then there may be a conflict with other software and you should remove perform basic system software troubleshooting procedures.

System 7.5: Failure After Partial Installation (4/95)

Revised: 4/7/95
Security: Everyone

System 7.5: Failure After Partial Installation (4/95)

Article Created: 22 February 1995
Article Reviewed/Updated: 7 April 1995

TOPIC -----

While installing System 7.5 from CD or floppy disks, I get part way through the install, usually to Disk 2, then an error message asks me to insert Disk 1. Next an error message says the installation could not be completed.

What can be causing this problem?

DISCUSSION -----

The Installer always asks for Disk 1 to be inserted if it finds a problem during the installation process, this behavior is normal. The error message is actually contained in the Installer code on Disk 1.

Possible Causes

There are two possible causes of the problem:

- A bad diskette, or a dirty or damaged CD
- A corruption in the internal PRAM of the computer

If the CD is dirty, clean it with a soft cloth and water. Be careful to wipe directly from the center out towards the edge; never in a circular path around the CD.

To determine if the problem is related to the diskette itself, first make sure all network, printer, third party Apple Desktop Bus (ADB), and external SCSI devices are disconnected. Clear PRAM by holding down the Command-Option-P-R keys at startup. You will hear the computer chime normally when it restarts. Continue holding the keys down until you hear three more chimes, then release the keys.

Retry the installation process, if it fails again at the same point, the floppy disk or CD you are using is probably damaged and should be replaced. Call

1-800-SOS-APPL or your local dealer for help.

DOS Compatibility Card: Macintosh Conflicts Affect MS-DOS (2/95)

Revised: 5/24/95
Security: Everyone

DOS Compatibility Card: Macintosh Conflicts Affect MS-DOS (2/95)

Article Created: 22 February 1995

TOPIC -----

I have a DOS Compatibility Card in my Macintosh, and I am having a problem with the MS-DOS side. This problem seems related to a Macintosh extension. Is it possible for a Macintosh extension to cause problems on the MS-DOS side? I am thinking that the extension in question is mapping the modem port, which is causing problems under MS-DOS.

If this is the case, would adding dedicated memory to the DOS Compatibility Card provide any help to me?

DISCUSSION -----

It is possible to have an init conflict on the Macintosh that affects the DOS Compatibility Card. Since the DOS Compatibility Card relies on the slot manager to function, any Macintosh system problem that 'locks up' the slot manager will also hang the DOS Compatibility Card.

Your hypothesis regarding your problem is correct. The problem is the result of both PC Setup and the modem extension trying to capture the modem port. The modem init replaces the normal serial driver with a network modem driver. The problem occurs at startup when PC Setup attempts to take control of the serial port. Since the modem port is busy (the modem init has 'captured' the port) the configuration process fails and the DOS card hangs. However, since the Macintosh startup process continues, both systems are operating at the same time, the Macintosh system continues to startup.

Adding more memory to the DOS card will not resolve this problem.

Workaround
=====

The work around is to set 'configure comm ports at startup' to none in the PC Setup control panel. If you want to use a network modem, you can configure the

appropriate comm port as needed. You can configure the comm ports with PC Setup running.

PrinterShare: Not Enough Memory Error (International) (2/95)

=====

Article Created: 22 February 1995

TOPIC -----

I am having problems using PrintShare with my StyleWriter II printer. Whenever I try to print, an error message appears on the screen stating that there is not enough memory to share the printer. I am using PrintShare v1.1.1 that ships with the French-Canadian version of System 7.5

DISCUSSION -----

This is a know issue with the French-Canadian version of PrintShare v1.1.1. However, there is a simple workaround. You can install PrintShare v1.1.1 that ships with the French-Canadian version of the Color StyleWriter 2400 software. Once you install this version of PrintShare, you can share your printer.

Pwr Macintosh 6100 DOS Compatible: Video Modes Supported (2/95)

Revised: 5/24/95
Security: Everyone

Pwr Macintosh 6100 DOS Compatible: Video Modes Supported (2/95)

Article Created: 22 February 1995

TOPIC -----

What is the maximum bit-depth (number of colors) I can obtain from a Power Macintosh 6100 DOS Compatible with a Color Plus, Multiple Scan 15, or Multiple Scan 17 Display?

DISCUSSION -----

Power Macintosh 6100 Video Support (Macintosh OS)

	13/14-in. Displays	16-in. Color Display	MS 17,20 Display
Video Port	MS Display @ 640x480	MS Display @ 832x624	@ 1024x768
-----	-----	-----	-----
HDI-45	32,768 Colors	256 Colors	N/A

Power Macintosh 6100 Video Support (MS-DOS/Windows)

	13/14-in. Displays	16-in. Color Display	MS 17,20 Display
Video Port	MS Display @ 640x480	Multiple Scan Display	@ 1024x768
-----	-----	-----	-----
DOS Card	VGA, SVGA @ 640x480 **	VGA, SVGA @ 640x480 & 800x600 **	N/A

** Note: If you intend to run Windows with 256 Colors at a resolution of 640x480 pixels or use an Apple Multiple Scan Display, Apple 16-Inch RGB or VGA display with 16 colors at a resolution of 800 x 600 you must install a display driver for the program you are using. See "Installing Video Drivers" page 39 of the User's Guide for more information.

From page 39 of the User's Guide: "Installing video drivers", select "Windows

3.1" as the application during the installation process.

If you are working with two monitors, make sure that both monitors are connected before starting the Macintosh and DOS Compatibility Card. The monitor dedicated to the Macintosh environment should be connected to the video port on the back of your Macintosh. The monitor dedicated to MS-DOS should be connected to your DOS Compatibility Card.

Troubleshooting

=====

Symptom

Interference and no video on 13/14-in. display.

Solution

When you have a monitor dedicated to the DOS Compatibility Card, it must be connected to the DOS Compatibility Card prior to turning on your Macintosh. If the monitor is not connected first, you will only see the interference. In the PC Setup control panel, the monitor selection displays 16-in. The 14-in. is not available. To correct this problem, shut down your Macintosh. You must shut down your computer, restarting it will not correct the problem. Once the computer is turned off, turn it back on. You can now open the PC Setup control panel and set the Display to 14-in. and start the DOS Compatibility Card.

PaperType Editor: Description, Installation, and Usage (2/95)

Revised: 2/22/95
Security: Everyone

PaperType Editor: Description, Installation, and Usage (2/95)

=====

Article Created: 22 February 1995

TOPIC -----

I see in the QuickDraw GX custom install, that you can install a utility called PaperType Editor. What is it and how do I use it?

DISCUSSION -----

Description

The PaperType Editor is a utility which allows you to define your own custom paper types and sizes. With the PaperType Editor you can create a custom menu item for any non-standard paper size that you use; such as, a strange stationary size or unusual envelope size. Once you have created your own custom paper definition, you will be able to print a document using your own custom-defined paper dimensions.*

Note:

This program will only run with QuickDraw GX installed.

Install the PaperType Utility

Step 1

Launch the QuickDraw GX Installer from your system 7.5 disk or CD by double-clicking its icon.

Step 2

Select Custom Install from the pop-up menu in the upper left corner.

Step 3

Click the arrow to the left of the QuickDraw GX Utilities box which is pointing to the right. It should now point down and reveal a list of utilities from which you can choose.

Step 4

Click an X in the box next to PaperType Utility.

Step 5

Click the Install button. This will place a copy of the utility on your hard drive.

Create a Custom Paper Definition

Step 1

Launch the PaperType Editor utility by double-clicking its icon.

Step 2

Enter the parameters for the paper: paper size, print area, and margins.

Step 3

Click on Save As. A navigation box will open.

Step 4

Type in a name for your custom paper definition in the text box beneath the words, "Save Paper Type as:". The default name will be "untitled 1," but you might want to give it a descriptive name, such as: note card, invitation, or small envelope.

Step 5

Click on Extensions. Then click Save. This will save the information into the Extensions Folder inside the System Folder.

Step 6

Quit PaperType Editor by pulling down the File menu and selecting Quit from the list.

Print a Document Using Your Custom Paper Definition

Step 1

Open the application from which you want to print (such as, SimpleText).

Step 2

Pull down the File menu and select Page Setup from the list. This will open the Page Setup dialog box.

Step 3

Pull down the Paper Type pop up menu in the Page Setup dialog box and select your newly defined custom paper name from the list.

The selection of this custom menu item tells the application from which you are printing the correct parameters for your custom paper.

* Note:

Not all applications support the PaperType custom-defined paper feature. The

application must be QuickDraw GX aware to use this feature.

Multimedia Starter CD Asks For Install Disk 2 (2/95)

Revised: 2/22/95
Security: Everyone

Multimedia Starter CD Asks For Install Disk 2 (2/95)

=====

Article Created: 22 February 1995

TOPIC -----

This article describes how the Multimedia Starter CD asks for "Install Disk 2" while installing the Hardware System Update (HSU) 2.0 included on the CD.

DISCUSSION -----

The Multimedia Starter CD comes with every Multimedia Kit, and it contains a folder called Macintosh System Updates. A user is instructed to Install HSU 2.0 on their system as part of the process. There is an Installer in the Macintosh System Updates folder which users are supposed to run. When a user runs this installer, he or she may be instructed to insert Install Disk 2, but there is no Disk 2.

If a user has already installed System 7.5, HSU 2.0 DOES NOT need to be installed.

A workaround is to view the Macintosh System Update folder by name under the View menu, and look for a folder called, Extensions and Control Panels. The contents of this folder can be moved by selecting the folder contents and dragging them to the active System folder.

AWS95.root #
```

DISCUSSION -----

We believe you unsuccessfully added a user with "adduser" involving "vipw" while setting the user password, or there was other user or process activity modifying the password file at the same time. This in turn, created a "ptmp" or "gtmp" locked file in the /etc directory.

We suggest stopping other users or processes from modifying the password file, and removing the /etc/ptmp or /etc/gtmp locked file, if there are any. This should take care of your problem.

Apple IP Gateway: -344 Error (6/96)

Revised: 6/4/96
Security: Everyone

Apple IP Gateway: -344 Error (6/96)

Article Created: 22 February 1995
Article Reviewed/Updated: 4 June 1996

TOPIC -----

I am having problems starting the Apple IP Gateway. I am using an SE/30, System 7.1, Asante SCSI-to-Ethernet adapter box, MacTCP 2.0.4, and ARA 2.0.1. I have a working TCP/IP connection on the SE/30, and I want to use this computer as an ARA dial in connection to the IP network.

I have attempted both Custom and Easy installs of IP Gateway software. Whenever I start the IP Gateway, I get the error, "Gateway cannot start because of a system error -344". This corresponds to a Start Manager error -- No more sResources.

In Chapter 1 of the IP Gateway manual, it states that the software will work with SCSI, NuBus, or PDS Ethernet interfaces. Why does this error occur?

DISCUSSION -----

The Apple IP Gateway 1.0 was not tested with any third-party SCSI Ethernet adapters. In the original design specifications, supporting third-party SCSI Ethernet adapters was anticipated. The manual should not state, the Apple IP Gateway supports third-party SCSI Ethernet adapters. The Apple IP Gateway team is aware of this and will either change the documentation, or revise the software to work with third-party SCSI Ethernet adapters.

If you are seeing this error, obtain the Apple IP Gateway 1.0.1 Patch, which can be found on Apple Computer's software update locations. The Apple IP Gateway 1.0.1 Patch Read Me states, "The IP Gateway now works with external SCSI Ethernet devices." However, the Apple IP Gateway may not work with ALL third-party SCSI Ethernet adapters.

These articles can help you locate the software update mentioned here:

..TIL17254-Apple_IP_Gateway-344_Error_6-96_(TA33351).pdf

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:

04 Jun 1996 - Updated for accuracy and changed distribution status.

22 May 1996 - Added reference to Apple IP Gateway Patch 1.0.1.

Power Macintosh AV: Displaying PAL Video at 768 x 576 (2/95)

Revised: 2/23/95
Security: Everyone

Power Macintosh AV: Displaying PAL Video at 768 x 576 (2/95)

=====

Article Created: 23 February 1995

TOPIC -----

When using a Power Macintosh AV with PAL video output, I can't select the PAL standard resolution of 768 x 576. I can only select the 640 x 480 resolution. With this resolution selected, a black border is visible around the screen image.

We have many customers with this problem. Do you have any suggestions?

DISCUSSION -----

When outputting a Power Macintosh AV's screen as a PAL video signal, the 768 x 576 screen resolution may not be visible in the Monitors control panel.

To set the Power Macintosh AV card to this resolution, try these steps:

- Open the Monitors control panel
- Click on the Options button
- Check the Display Video on Television button
- Select PAL video
- Select Upon Restart Display Video on Television
- Restart the Power Macintosh

The Power Macintosh AV system should display the 768 x 576 resolution on the PAL monitor after restarting the computer. After restarting, you may want to reopen the Monitors control panel to adjust your video settings.

DOS Compatibility Card: PC Dongles May Not Work (10/96)

Revised: 10/4/96
Security: Everyone

DOS Compatibility Card: PC Dongles May Not Work (10/96)

=====

Article Created: 23 February 1995
Article Reviewed/Updated: 3 October 1996

TOPIC -----

I have a DOS Compatibility Card and want to know if a PC hardware dongle works with this card. Also will hardware keys, like the kind used with 3D Studio which connects to the parallel port, work with the DOS Compatibility Card?

DISCUSSION -----

Many PC dongles or hardware keys are parallel devices and connect to LPT1. These will not work with the DOS Compatibility Card because the card does not have a parallel port. Dongles or hardware keys that use the serial port may work depending on how they receive power.

The Macintosh serial ports are RS-422 ports and do not support all RS-232 signals. In particular, the Carrier Detect (CD), Data Set Ready (DSR), Request To Send (RTS), and Ring Indicator (RI) signals are not available. On page 71 of the DOS Compatibility Card user's manual (or page 105 of the PC Compatibility Card user's guide), there is additional information about using PC peripherals. Included is a chart listing the Macintosh serial port signals and Mini DIN-8 pinouts along with corresponding DB-9 and DB-25 pinouts.

If you have tried using the dongle and it did not work, you will need to contact the vendor to obtain specific information about how the dongle receives power. If it gets power from any of the four unsupported signals, it will not work. However, if it is powered by a signal, other than the four unsupported signals, then you may be able to get it working by using the information on page 71 along with pinout information supplied by the vendor.

We are not aware of any dongles that will work with the game port.

ARA 1.0 & 2.x: Connection Document Compatibility (2/95)

Revised: 2/23/95
Security: Everyone

ARA 1.0 & 2.x: Connection Document Compatibility (2/95)

=====

Article Created: 23 February 1995

TOPIC -----

I have upgraded from Apple Remote Access (ARA) 1.0 to 2.x. I want to know if I can continue to use the connection documents saved under ARA 1.0, or do I have to create new connection documents for ARA 2.x?

DISCUSSION -----

ARA 2.x connection documents contain additional resources not found in 1.0 connection documents. These resources are used to provide the additional functionality offered by ARA 2.x such as using Dial Assist, dialing an alternate number, and compatibility with 1.0 servers. Despite these differences the documents are interchangeable, ARA 1.0 simply ignores the additional resources. When a user upgrades from 1.0 to 2.x the old connection documents can be used. It is not necessary to create new connection documents. The first time an old document is saved under 2.x it will be updated to contain the new resources.

CCLs written for ARA 1.0 can be used with ARA 2.x but will not support the added features in 2.x such as blind dialing. For example, the Express Modem software provides two CCL files, one for use with 1.0 and one for 2.x. Check with the modem manufacturer for the proper CCL to use.

AppleSearch Quick Start (7/96)

Revised: 9/26/96
Security: Everyone

AppleSearch Quick Start (7/96)

=====

Article Created: 23 February 1995
Article Reviewed/Updated: 02 July 1996

TOPIC -----

This article will help you install your AppleSearch software. While this information will get you started quickly and easily, the documentation that came with AppleSearch contains important additional information.

DISCUSSION -----

In order to set up your server for AppleSearch you need to name your server, specify its owner, and enable program linking using the Sharing Setup control panel, if you haven't already done so.

Installing the AppleSearch Server Software
=====

Follow the steps in this section to perform an Easy Install (all components) of the AppleSearch Server software.

Step 1

Insert the disk AppleSearch Server 1 into your disk drive and open the Installer program.

Step 2

Select the disk where you want to install AppleSearch, then click Install.

Step 3

Remove the AppleSearch Server 1 disk and insert the AppleSearch Server 2 disk when prompted by the Installer software.

Step 4

Remove the AppleSearch Server 2 disk and re-insert the AppleSearch Server 1 disk.

Step 5

Click the Restart button when the installation is finished.

NOTE: If you're using a version of AppleShare earlier than 3.0.2, run the AppleShare 3.0.2 patch located on the AppleSearch Server 3 disk. Only AppleShare 3.0.2 or later is supported with AppleSearch.

Starting Up AppleSearch

=====

Follow these steps to start up the AppleSearch Server program.

Step 1

Open the AppleSearch Server folder.

Step 2

Double-click the AppleSearch Server icon.

Adding Shared Volumes or Folders as Information Sources

=====

To designate a shared volume or folder of documents as an AppleSearch information source, simply add the shared item (volume or folder) to the list of information sources, as described in this section.

IMPORTANT: Before proceeding, make sure that you have sufficient disk space, equal to the size of the information source, for storing temporary files. If you don't have enough room on your startup disk, the default location for storing temporary files, choose Preferences from the Server menu and select another locally connected disk for the temporary files.

The AppleSearch Server application allocates 3500 KB of RAM to support 10 information sources. You need to allocate an additional 100 KB to the AppleSearch Server application for each information source beyond 10 that you add. Follow these steps to designate shared items as information sources:

Step 1

Choose Information Sources from the Server menu.

Step 2

Click the shared volume or folder that you want to designate as an information source. Use the pull-down menu, if necessary, to find the correct item.

Step 3

Click the Add button to designate the volume or folder as an information source.

Step 4

Select where you want to store the index files associated with the specified information source using the "Store index on" pop-up menu. The pop-up menu contains a list of all locally connected volumes on your server.

Step 5

Click the OK button.

Indexing Information Sources

=====

When you index an information source, AppleSearch makes a list (an index) of every distinctive word contained in the source. A separate index must be created for each information source. Follow these steps to perform immediate indexing of an information source:

Step 1

Select the information source on the right side of the Information Sources window.

Step 2

Click the Index button.

NOTE: The information sources are indexed at an average rate of 10 to 20 MB per hour when the information source is on a hard disk.

Moving an Index

=====

You can move the index of an information source from one hard disk volume to another as your needs determine. If you're using a pre-indexed CD-ROM as an information source, you may want to copy its index to a hard disk to improve the speed of information searching. You may also want to move the index from one volume to another if storage space on the current volume is becoming limited.

Moving an Index from CD-ROM to Hard Disk

Step 1

Mount the pre-indexed CD-ROM on your server desktop.

Step 2

Create a new folder called "AppleSearch Indexes" (if one doesn't already exist) at the root level of the volume where you want to move the index.

NOTE: Do not change the name of the AppleSearch Indexes folder. The AppleSearch Server software looks for a folder that is specifically named AppleSearch Indexes.

Step 3

Open the CD-ROM and its AppleSearch Indexes folder.

Step 4

Locate the information source index that you want to move.

NOTE: The index consists of three files. Each file has the same name as its

information source plus the suffix .def, .pls, or .sif.

Step 5

Copy the three index files from the CD-ROM to the AppleSearch Indexes folder that you created in Step 2.

Step 6

Open the Information Sources window.

Step 7

In the left side of the window, locate the information source on the CD-ROM and select its name.

Step 8

Click the Add button.

Step 9

Click the pop-up triangle by the volume name and use the directory list to select the hard disk that contains the newly copied index.

Step 10

Click OK.

Moving an Index from One Hard Disk to Another

Step 1

Quit the AppleSearch Server application.

Step 2

Create a new folder called "AppleSearch Indexes" (if one does not already exist) at the root level of the volume where you want to move the index.

NOTE: Do not change the name of the AppleSearch Indexes folder. AppleSearch Server software looks for a folder that is specifically named AppleSearch Indexes.

Step 3

Open the original AppleSearch Indexes folder at the location you specified when you first added the information source.

Step 4

Locate the index of the information source that you want to move.

NOTE: The index consists of three files. Each file has the same name as its information source plus the suffix .def, .pls, or .sif.

Step 5

Copy the three index files from the source volume to the destination volume.

Step 6

Delete the older set of index files from the source volume by dragging their icons to the trash.

Step 7

Restart the server.

Step 8

Use the directory list in the pop-up menu to find the new AppleSearch Indexes folder and open it.

Step 9

Select the name of the index file, then click the Open button.

Setting Preferences

=====

By setting preferences you can schedule automatic indexing, designate a location for the storage of temporary files associated with indexing, and set an optional password required for server administration. To set server preferences, follow these steps:

Step 1

Choose Preferences from the Server menu.

Step 2

Specify the days of the week and times of the day when you want indexing to occur.

Step 3

Specify the folder or volume where you want the temporary files to be stored by using the "Store temporary files on" pop-up menu.

IMPORTANT: To avoid running out of storage space, be sure that you select a location that has available disk space equal to approximately 1.5 times the size of the information source.

NOTE: If you specify a different volume on which to store temporary files, the change will not take effect until the server is restarted.

Step 4

If you want to restrict access to server administration windows, click Always Require Password.

Step 5

To set a password, click the Set Password button.

- Type a password in the "New password" box.
- Type the password again (for confirmation) in the "Confirm new" box.
- Click the OK button.

NOTE: The password goes into effect only after you click the Always Require Password button. In other words, you may set a password and confirm it, but it will not become active until you click Always Require Password.

Working with the AppleSearch Stopwords List

=====

While creating an index for the information source, AppleSearch filters out certain non-distinctive words, called stopwords, such as articles (for example: "the", "an", "a"), and prepositions (for example: "with", "of", "on"). You can modify the contents of the stopwords list to add or delete specific stopwords, as your needs determine.

NOTE: Unless you have very special needs, you should not modify the AppleSearch Stopwords file. The file conforms to established conventions for standard information search-and-retrieval systems.

Follow these steps to modify the stopwords file:

Step 1

Shut down the AppleSearch Server program by choosing Quit from the File menu.

Step 2

Open the AppleSearch folder within the Preferences folder of your System Folder.

Step 3

Open the AppleSearch Stopwords file.

IMPORTANT: Keep the words in alphabetical order. The stopwords file is sorted alphabetically and must be kept in alphabetical order.

Step 4

Add words to the list or remove them as needed. You can also modify existing stopwords.

NOTE: If you modify the stopwords list, you should delete the indexes that used the old stopwords list; then, re-index all the corresponding information sources.

Step 5

Save the stopwords list as a text-only file but do not change its name.

Step 6

Restart the server.

Installing the AppleSearch Client Software

=====

Follow the steps in this section to install the AppleSearch client software on your computer.

Step 1

Insert the AppleSearch Client Installer disk into your floppy disk drive, open

the disk, and double-click the Installer icon.

Step 2

Select the disk where you want to install AppleSearch, then click install.

Step 3

Click the Restart button to restart your computer.

Connecting to an AppleSearch Server

=====

Step 1

Open your AppleSearch Client folder and then open the AppleSearch Client application.

Step 2

If your network contains zones, they are listed in the lower-left corner of the Select an AppleSearch Server window. Select the name of the zone in which your AppleSearch server resides.

Step 3

Select the name of the Apple Workgroup Server that you want to use in the top-left corner of the window, then select the AppleSearch Server program on the right side of the window.

Step 4

Click the OK button.

Step 5

Connect as a registered user or guest.

Creating an AppleSearch Reporter

=====

An AppleSearch Reporter is an electronic search agent that actively finds the information you want on the AppleSearch server and makes it available to you. To create a Reporter you need to tell it where to look, what to look for, and when to look for the information. You can do this by doing the following:

Step 1

From the AppleSearch window, click the New Reporter button to open a new Reporter window.

Step 2

Click the Info Sources button or choose Info Sources from the Search menu.

Step 3

Review the available information sources in the left side of the Information Sources window and click the ones that are most relevant to your search.

Step 4

Click the Add button to specify that the selected sources should be searched by the AppleSearch Reporter.

NOTE: If you decide that a source you selected is not appropriate, select its name in the right side of the window, then click Remove.

Step 5

Click Done when you have finished adding or removing information sources.

Step 6

Type a search request in the "Search for" box.

IMPORTANT: If you copy and paste words into the "Search for" box, use only alphanumeric characters (letters and numbers) and avoid using the words and, or, and not. Your Reporter translates the search request from your own words into Boolean operations; and, or, and not, and certain non-alphanumeric characters have specialized meanings in AppleSearch. For more information see chapter 3 of your "AppleSearch User's Guide."

Step 7

Specify the Minimum Rank (for relevance ranking) in the Search Options box. See Chapter 3 of the "AppleSearch User's Guide" for detailed information on relevance ranking.

Step 8

Specify the Maximum Returns in the Search Options box.

Step 9

Specify the After Date in the Search Options box to limit how far back in time you want your reporter to search.

Obtaining Immediate Search Results

To obtain immediate search results perform the following steps:

Step 1

Click the Start Search button in the top of the Reporter window.

Step 2

Double click the information source icon or name in the lower part of the window, or click the adjacent triangle.

Step 3

Double click any article title to view its content.

Step 4

To close the Article Viewer click the close box.

Additional Options

Once you have a reporter that you want to save, all you have to do is click the Save Reporter button on the right side of the Reporter window or choose Save

Reporter from the Search menu, type a name for your Reporter in the "Save as" box, and then click Save.

See chapter 2, Scheduled0receiving an update, in your "AppleSearch User's Guide" to learn how to schedule a Reporter to retrieve information on a regular basis.

Your "AppleSearch User's Guide" also contains additional valuable information that will increase the usefulness of your AppleSearch software.

Where to Get More Information =====

For additional information about AppleSearch, you have two other sources of information: The "AppleSearch Administrator's Guide" and the "AppleSearch User's Guide."

This article is one of many available through the Apple Fax center. For a complete list of available Fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

AppleShare Quick Start (7/96)

Revised: 7/3/96
Security: Everyone

AppleShare Quick Start (7/96)

=====
Article Created: 23 February 1995
Article Reviewed/Updated: 02 July 1996

TOPIC -----

This article will help you set up your AppleShare server.

DISCUSSION -----

Introduction

This Quick Start article will help you set up your AppleShare server. While this article will get you started quickly with your AppleShare server, the documentation supplied with your software -- both printed and electronic -- contains important additional information. The instructions in this section assume you have already performed these tasks:

- You have set up the server computer and connected the server computer to the network.
- You have activated AppleTalk in the Chooser window and selected the appropriate network type in the Network control panel.
- AppleShare 4.0.x (Apple Workgroup Server 60, 80, 6150, or 8150), or AppleShare Pro (Apple Workgroup Server 95) is installed on your Apple Workgroup Server.

If you have not yet performed these tasks, see the documentation that came with either your server computer, or the manual that came with your network cabling system.

NOTE: Make sure you have all of the components assembled before starting.

Setting Up File Service

----- Step 1

..TIL17263-AppleShare_Quick_Start_7-96.pdf

Choose the AppleShare Admin program alias from the Apple menu.

Step 2

Apple Workgroup Server 60, 80, 6150, or 8150: Enter a contact name and telephone number, and the name of your organization, then enter your serial number and click OK.

Step 3

Name the file server.

Step 4

Enter an Admin Key and then click OK.

IMPORTANT: Remember your Admin Key! This is the last time you'll see the Admin Key on the screen. Record it somewhere. Replacing a forgotten Admin Key is difficult and time consuming. See the "Troubleshooting" chapter in your setup manual for instructions on replacing the Admin Key.

Step 5

Confirm the Admin Key and then click OK.

Step 6

Enter your administrator name and password and then click OK.

After a few moments, you see three windows -- the User List, Group List, and User Information windows. For now, you will work only with the User Information window. Each user account you create will have its own User Information window. This one is for you as the administrator.

Step 7

Enter an administrator name in the Name box.

Step 8

Enter a password.

IMPORTANT: Don't use a password that is the same as the Admin Key. Keeping the two distinct provides an added level of server security.

Step 9

Verify your AppleShare options. These options are explained in the section "Registering Users" in Chapter 2 of the AppleShare administrator's guide.

Step 10

Click Save.

Step 11

Close the User information window.

Allowing or Denying Guest Access

If you allow guest access, anyone connected to the network can log on to the file server. If you deny guest access, only registered users can log on. The

program is preset to deny guest access.

IMPORTANT: If you are not sure whether to allow guest access, do nothing for now. You can always change the setting later.

Step 1

Open the User List window, if it isn't already open.

Step 2

Double-click the <Any User> entry in the User List window.

Step 3

Click the Login Enabled checkbox to place an X in it.

Step 4

Click Save.

Step 5

Close the User Information window.

Registering Users

Registering users means assigning each user a personal file server account. Each user you register is listed in the Users and Groups Data File kept in the server's Preferences folder.

Step 1

Choose Create User from the Users menu.

Step 2

Enter the user's name.

Step 3

Enter a password.

Step 4

Select this user's AppleShare options.

Here's a brief summary of how these options function:

Login Enabled lets the user log on to the file server. You must select this option to let the user gain access to the file server.

Change Password Enabled lets the user change his or her own password.

All Privileges Enabled gives the user access to all volumes and folders on the server computer, regardless of whether you've shared them.

Require New Password on Next Login makes the user change the password the first time they log on to the file server.

Program Linking Enabled allows a user to create a link between a program on the

server and a program on the user's computer. If other networking services are installed on the server computer, the list of options may be longer.

Step 5

Click Save to confirm the entries.

Step 6

Close the User Information window.

Step 7

Repeat steps 1 through 6 for each user you want to register.

Setting Up and Adding Members to Groups

Creating groups allows you to consolidate access privileges for volumes and folders available on the file server. For more information, see Chapter 2, "Setting Up File Service," in the AppleShare administrator's guide.

Step 1

Choose Create Group from the Groups menu.

Step 2

Enter a name for the group.

Step 3

Click Save.

Step 4

Choose User List from the Users menu, then select the users you want to assign to this group.

Step 5

Drag the icons representing the users you selected to the Members box in the group window.

Step 6

Close the group window.

Sharing Volumes and Folders and Setting Access Privileges

Now that you've registered users and created groups, you need to share volumes on the file server. This means you will indicate which hard disks and folders you want to make available to users on the file server. If you need more than the following information, refer to the documentation for a complete description of sharing volumes and setting access privileges.

Step 1

Choose Access Information from the Privileges menu.

Step 2

Select a volume -- or a folder from within a volume -- from the Volumes list.

IMPORTANT: When you share an entire hard disk, all of the folders contained on it are available to users. Also, AppleShare Pro does not allow you to share the "/" volume. You must share specific folders within the / volume to share the contents of the / volume. Also, if you choose a mount point for a shared disk within a volume or folder, you cannot share the enclosing volume or folder. Disks that are mounted within a folder must be shared through explicit privileges. See the "AppleShare Pro Administrator's Guide" for additional information.

Step 3

Click Share to share the selected volume or folder.

NOTE: The Share button changes to an Unshare button each time you share a selected volume or folder.

Step 4

For folders, click the Same as Enclosing Folder option to remove the X.

Step 5

If necessary, assign an owner to the volume or folder. You can change ownership if you want, using the following procedure:

Step 5-a

Select the volume or folder in the Shared Items box.

Step 5-b

Select the user or group you're assigning ownership to.

Step 5-c

Select the icon of that user or group and drag it to the Owner box in the Access Information window.

Step 6

Assign a user or group to the volume or folder.

You need to indicate which user or group will have access privileges for each shared item:

Step 6-a

Choose User List from the Users menu or Group List from the Groups menu.

Step 6-b

Select the user or group you're assigning privileges to. You can choose one user or one group.

Step 6-c

Select the icon of that user or group and drag it to the User/Group box in the Access Information window.

Step 7

Select the access privileges for the volume or folder.

Step 8

Select the access privileges for guests by clicking the appropriate boxes for Everyone.

Step 9

If you want to apply the same access privileges to all the folders within the volume or folder you've shared, click the Change All Enclosed Folders checkbox to place an X in it.

Step 10

Click Save.

Step 11

Click the button representing the choice you want and click OK.

Step 12

Repeat steps 2 through 11 for each item you want to share.

Step 13

Close the Access Information window.

Step 14

Quit the AppleShare Admin program.

Starting the AppleShare File Server Program

Choose the AppleShare File Server program alias from the Apple menu.

Setting Up Print Services

This section explains how to capture a printer for spooling documents over the network, set printer options, and begin using print service.

Step 1

Choose the AppleShare Print Server alias from the Apple menu.

Step 2

Select the icon for the type of printer you want to capture in the Printer Types box.

Step 3

If necessary, select the zone the printer is in.

Step 4

Select the printer you wish to capture from the Available list.

Step 5

Click Capture.

Step 6

Select the options you want for this printer.

Step 7

Click OK. The program captures the printer you selected. In a moment, two windows appear -- the Queue and Log windows for the captured printer.

Step 8

Close the Queue and Log windows. You won't need to use these windows until after users begin using the print server.

Step 9

Choose Setup from the File menu. The Setup window appears again.

Step 10

Repeat steps 2 through 8 for each additional printer you want to capture.

Step 11

Verify that all users have the same printer drivers installed on their computers.

NOTE: You will not experience significant Print Server performance differences between AppleShare 3.0.x, AppleShare 4.0.x, and AppleShare Pro because the bottleneck in print server performance is the printer, not the server.

Where to Get More Information

For additional information about AppleShare, you have two other sources of information:

The AppleShare 4.0.x or AppleShare Pro Administrator's Guide -- either the electronic or printed version-and Balloon Help, which is built into the AppleShare software.

This article is one of many available through the Apple Fax center. Extra Pages When Printing a Window From the Finder (2/95)

Revised: 2/23/95
Security: Everyone

Extra Pages When Printing a Window From the Finder (2/95)

=====

Article Created: 23 February 1995

TOPIC -----

When I print a list (View by Name) of a window from the Finder I get pages of text alternating with "blank" sheets that only have a header on each page. Why is it printing these pages with nothing but headers on them? Is there something wrong with my printer?

DISCUSSION -----

This situation occurs because the window being printed is wider than a single sheet of letter size (8 1/2 x 11) paper. The "blank" pages that only have headers on them are actually the right sides of a left and right sided two page width window. In other words, if you were to line up all of the pages side by side in two columns each, you would see that, in at least one instance, some text from the left page would "run-over" onto the right page.

To prevent this from occurring:

- Pull down the File Menu and select Page Setup. Change the orientation from Portrait to Landscape. Then print.

or

- Use the Views control panel to turn off various window elements, such as: Show size, Show kind, Show label, Show date, Show version, and Show comments. If you remove enough of these elements, you will decrease the width of the window, so that it will no longer be more than one page across.

System 7.5: Daystar Turbo Card Compatibility (2/95)

Revised: 2/24/95
Security: Everyone

System 7.5: Daystar Turbo Card Compatibility (2/95)

Article Created: 24 February 1995

TOPIC -----

I'm having problems installing System 7.5 on my Macintosh IIci. I discovered that this was due to an incompatibility with my Daystar Turbo 040 card. Do you know what's wrong?

DISCUSSION -----

In Daystar's forum on CompuServe, there is information that a ROM upgrade is needed for their 68040-base card. There is a small charge for the replacement, you need to contact Daystar. The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Daystar's 68030-based cards do not need to be upgraded.

The ROM upgrade comes as a field upgrade, meaning the end user is responsible for the installation. For those who don't mind opening their Macintosh, removing cards, and then replacing a chip it's pretty easy. Daystar provides you with a chip removing tool and a grounding strap. On the Turbo 040 card, the ROM chip is the only one that is socketed, the rest of the chips are soldered. In addition to the instructions and the pictures, it would be extremely difficult to get the wrong chip.

MacTCP: DNS (Domain Name Server) Configuration Problems (7/96)

Revised: 7/3/96
Security: Everyone

MacTCP: DNS (Domain Name Server) Configuration Problems (7/96)

Article Created: 24 February 1995
Article Reviewed/Updated: 02 July 1996

TOPIC -----

I'm having a problem with the MacTCP Domain Name Server (DNS). Below is the problem and some attempts to resolve it.

Begin_Table

If I set up the MacTCP DNS information like this:

Domain	IP Address	Default
colby.edu	137.146.210.37	X
.	137.146.210.33	

End_Table

If the server 137.146.210.33 goes down, and I query the name "colby.edu"; the name doesn't resolve but all other names do. This is a problem because everyone queries the name "colby.edu" to receive email.

However if I add another host to the end of the DNS info like this:

Begin_Table

Domain	IP Address
.	137.146.210.39

End_Table

I can access "colby.edu", at least as long as that server is up.

I have two questions:

Question 1

Is the use of a period in the domain still valid for the MacTCP DNS information? The documentation we have for MacTCP 1.x says that using a period will substitute the Domain Name above. The documentation for 2.x doesn't mention using the period. If I replace the period in the above example that didn't work, the "colby.edu" address does resolve.

Question 2

How exactly does MacTCP determine which server to query first and the order for querying?

I've tried this with MacTCP 2.0.4 and 2.0.6. Here is the situation:

If I set up MacTCP with domain name servers like this:

Begin_Table

Domain	IP Address	Default
colby.edu	137.146.210.37	X
.	137.146.210.33	

End_Table

Everything resolves properly when both machines are up. However, when 137.146.210.33 goes down names like "server.colby.edu" are resolved properly but the name "colby.edu" is not resolved.

Later last week we had another situation. MacTCP was set up like:

Begin_Table

Domain	IP Address	Default
colby.edu	137.146.1.5	X
.	137.146.210.37	
.	137.146.210.33	

End_Table

The name server 137.146.1.5 crashed, and the other two servers weren't being used to look up the address "colby.edu". This can be frustrating for users, one setup of MacTCP DNS will work because it doesn't have an entry for the server that is "down" while another user won't work because they do have an entry for the server that is down.

In the first case above, if I replaced the period with "colby.edu" the address "colby.edu" would resolve properly. However that isn't true for the second example.

Basically, if a name server in the Domain Name Server list goes down and you

query on a name that appears in the domain name list that name may not get resolved to its IP address. I say may because in example #1 if I add the entry:

Begin_Table

Domain	IP Address
.	137.146.210.37

End_Table

to the DNS information then "colby.edu" does resolve to its proper IP address.

DISCUSSION -----

There are several ways to setup MacTCP to handle domain name servers:

Begin_Table

Method 1

Domain	IP Address	Default
colby.edu	137.146.210.37	X
.	137.146.210.33	

End_Table

With this configuration, all DNS lookups within the domain of "colby.edu" (for example, ftp.colby.edu) will be made to 137.146.210.37. Lookups with any other domain (for example, ftp.support.apple.com) will go to 137.146.210.33. The "." ends up being a wild card that matches anything that "colby.edu" does not.

The draw back to this method is that 137.146.210.37 is not used for all lookups. This can be a real problem if the second name server is slow or unreliable.

Also, if you have a machine with the same name as the domain, MacTCP will look for it in the parent domain. In your situation, the host "colby.edu" has the same name as the domain. So MacTCP thinks the host is in the "edu" domain and uses 137.146.210.33 for the lookup. This is okay as long as 137.146.210.33 is up. If it is down, the name lookup will fail even though 137.146.210.37 is up.

This is the most likely the problem you are experiencing.

Begin_Table

Method 2

Domain	IP Address	Default
.	137.146.210.37	X
.	137.146.210.33	

End_Table

This method works well in most respects. 137.146.210.37 would be used for all DNS lookups unless it was down. If 137.146.210.37 were down, then 137.146.210.33 would be used instead.

The only problem with this method is that you must use fully qualified domain names even when addressing hosts in your domain. For example, if you were using the host "test.colby.edu" and wanted to telnet to ftp.colby.edu, you would have to type "telnet ftp.colby.edu". If MacTCP were setup as in example 1 above, all you would have to type is "telnet ftp".

Begin_Table

Method 3

Domain	IP Address	Default
colby.edu	137.146.210.37	X

End_Table

This method is a good way to go if your primary domain server never goes down.

Begin_Table

Method 4

Domain	IP Address	Default
colby.edu	137.146.210.37	X
.	137.146.210.37	
.	137.146.210.33	

End_Table

This method is the best way to go and the one we recommend using. It will use 137.146.210.37 for all lookups unless it is down and still allows you to use partially qualified domain names.

This method should solve your problem.

PowerBook 145B &150: Backup and Restore Instructions (1/96)

Revised: 1/8/96
Security: Everyone

PowerBook 145B &150: Backup and Restore Instructions (1/96)

Article Created: 27 February 1995
Article Reviewed/Updated: 8 January 1996

TOPIC -----

Does Apple provide any software for backing up the hard drive of the Macintosh PowerBook 145B or PowerBook 150?

DISCUSSION -----

There is a program on the hard disk of both of these computers. On the PowerBook 145b it is called PowerBook 145B Backup. The PowerBook 150 also contains a similar Backup program. The instructions for use are almost identical for both applications on both computers.

This program will back up all the files on your hard drive to be used if some or all of your data become damaged. It is important to perform the backup on a regular basis to insure you against the unlikely event of any data loss. Be sure to have a supply of high density diskettes to back up onto.

Backup Process
=====

Step 1

Launch the PowerBook Backup program by double-clicking its icon. The program is located on the hard disk.

Step 2

Click the Continue button.

A message appears, telling you how many high-density diskettes you need to make the backup and approximately how long it will take. Make sure you have enough time and disks to complete the backup. If you stop the process before it's finished, you'll have to start over again from the beginning.

Step 3

Click the appropriate button. The first time through, select Copy System Folder. The second time through, select Copy All Files.

Step 4

Insert a high-density floppy disk into the disk drive.

Step 5

Follow the instructions on the screen until a message tells you that you're finished. As you remove each disk from the computer, label each disk in an ascending order so they can be inserted in the proper order for the restore operation.

Step 6

Repeat steps 1-5 and select Copy All Files to make a backup of all files on your hard disk.

When you're finished, be sure the floppy disks are properly labeled and locked, then store them in a safe, cool place.

Restore Process

=====

Step 1

Get the floppy disk labeled Disk Tools (or Utilities disk if you are using the PowerBook 150) that came with your computer and the floppy disks that you used to backup up your hard disk.

Step 2

Make sure your PowerBook is powered off.

Step 3

Insert the Disk Tools diskette (or Utilities disk) into the PowerBook and turn on your computer.

Step 4

After the computer starts up, locate the PowerBook Restore icon on the Disk tools disk (or Utilities disk).

Step 5

Launch the PowerBook Restore application.

Step 6

Read the information on the screen and click the Continue button.

Step 7

Insert the first backup disk. The restoration proceeds automatically from there.

Step 8

Respond to any messages you see on the screen. If PowerBook Restore finds an item on your hard disk that is newer than an item with the same name on the

floppy disk, you are asked whether you want the older version of the item to replace the newer version. Select the choice you want.

Step 9

Repeat steps 7 and 8 for the next disk in your stack of backup disks. Make sure you insert disks in the correct order.

Step 10

The PowerBook Restore program lets you know when you are finished. Store your backup disks in a safe, cool place.

Step 11

Restart your PowerBook and make sure that everything is back on your hard drive.

Article Change History:

08 Jan 1996 - Added information about PowerBook 150 Utilities disk.

10 May 1995 - Clarified several steps and changed title.

QuickTime: Directing Playback to a MIDI Device (2/95)

Revised: 2/27/95
Security: Everyone

QuickTime: Directing Playback to a MIDI Device (2/95)

=====

Article Created: 27 February 1995

TOPIC -----

How do I direct QuickTime movie information to my MIDI device? Does it require additional software, and if so, where can I obtain it?

DISCUSSION -----

There are two sources of the Music Device Configuration software required to switch from the Macintosh Built In Software Synthesizers and Modem output to other MIDI hardware equipment.

The first source is a CD-ROM bundled with the book - "QuickTime - The Official Guide for Macintosh Users" - by Judith Stern and Robert Lettieri from Hayden books. \$45.00

The second source is the QuickTime 2.0 Software Developer Kit available from APDA. \$195.00.

Power Macintosh: Internal Speaker Volume (4/95)

Revised: 4/26/95
Security: Everyone

Power Macintosh: Internal Speaker Volume (4/95)

Article Created: 27 February 1995
Article Reviewed/Updated: 26 April 1995

TOPIC -----

After upgrading one of our Power Macintosh 8100 computers to an AV version with a CD-ROM, the sound volume from the internal speaker seems lower.

Is this a design to accommodate external amplification, or is it common to all Power Macintosh computers?

DISCUSSION -----

The audio amplification level used by the current Power Macintosh computers is slightly lower than the amplification level of previous Macintosh models. This is due to changes in the chip used to amplify the audio signals.

The use of external amplified speakers is unaffected by the lower volume level since you would use the volume control on the external speakers to control the volume.

Article Change History:
26 Apr 1995 - Minor typographical corrections.

Retrospect Remote: Throughput Varies During Backup (2/95)

Revised: 2/27/95
Security: Everyone

Retrospect Remote: Throughput Varies During Backup (2/95)

=====

Article Created: 27 February 1995

TOPIC -----

I'm seeing highly variable rates of throughput when doing a backup over the network with Retrospect Remote. It's taking 3 to 12 hours to run a daily incremental backup of all my workstations. What is taking this so long?

DISCUSSION -----

One thing to check is that your workstations are not logged onto file servers during the backup process. When a user chooses shutdown and goes into Retrospect's wait mode, the computer does not dismount file servers which causes a slowdown of file transfer. We have been told that a backup throughput can increase from 0.5 MB/second to 5+ MB/second when file servers are mounted on a workstation.

Macintosh AV: Video Depth Set In Applications (2/95)

Revised: 2/27/95
Security: Everyone

Macintosh AV: Video Depth Set In Applications (2/95)

=====

Article Created: 27 February 1995

TOPIC -----

When recording video on both a Power Macintosh AV or Quadra AV, with the monitor set to 256 gray levels, the recording is actually in 16 gray levels. Why?

This problem does not appear to be software related since I have tried this with two different applications and had both with the same results.

DISCUSSION -----

The color settings for the main monitor do not necessarily influence the way video recording applications, such as Fusion Recorder, capture QuickTime movies.

The color depth used for recording movies can be adjusted separately, using the video settings window.

To adjust the color level video applications use to record QuickTime movies, open the video settings dialog box. In Fusion Recorder, this is accessed by choosing "Video Settings..." from the "Record" menu.

Choose "Compression" from the pop-up menu in the upper-left corner of this window. Then choose a compression option from the "Compressor" pop-up menu. If no compression is desired, choose "None".

Depending on which compressor was chosen, the available color depth options appear in the "Depth" pop-up menu. The video compressors "Component Video", "Component Video -- YUV", and "Video" only work in color.

After adjusting these settings, the video application should record movies at the chosen color depth. If the compressor's color depth was set to "256 grays", the video application will record an 8-bit grayscale movie, regardless of the settings in the monitor control panel. Even if the monitor was set to "Black & White", the video application can record in 8-bit grayscale as long as the options in the video settings window were set correctly.

Pwr Mac DOS Compatibility Card: PC/TCP Does Not Function (7/95)

Revised: 7/5/95
Security: Everyone

Pwr Mac DOS Compatibility Card: PC/TCP Does Not Function (7/95)

=====

Article Created: 27 February 1995
Article Reviewed/Updated: 5 July 1995

TOPIC -----

I cannot get the PC/TCP software to function properly on my Power Macintosh DOS Compatibility Card. When I try to ping a good location, I get an ARP failure. How can I solve this problem? Also are there other PC products that would let me mount NFS partitions?

DISCUSSION -----

This a problem with FTP's software, there are two known workarounds. Use the workaround that corresponds to the version of PC/TCP you are using.

PC/TCP v2.3
=====

Step 1

Start the MS-DOS/Windows environment. This loads all the IP software. If you try to PING at this point you get an ARP failure. At this point you must add the following lines to the NET.CFG file:

```
Protocol IP 800 Ethernet_II
Protocol ARP 806 Ethernet_II
Protocol RARP 8035 Ethernet_II
```

Step 2

Perform warm-restart (ctl-alt-del)

Step 3

Remove the lines added in step 1 from the net.cfg and warm-boot again.

After step 3, FTP's PC/TCP software functions correctly. If you restart your Macintosh, you must perform all three steps again.

PC/TCP v3.1
=====

Step 1

Start the MS-DOS/Windows environment. This loads all the IP software. If you try to PING at this point you get an ARP failure. At this point you must unload network drivers down to LSL.COM.

Step 2

Add following lines to NET.CFG:

```
Protocol IP 800 Ethernet_II
Protocol ARP 806 Ethernet_II
Protocol RARP 8035 Ethernet_II
```

Step 3

Load network drivers again.

Step 4

Unload network drivers.

Step 5

Remove lines added in step 2 from the NET.CFG file

Step 6

Reload network drivers.

After step 6, FTP's PC/TCP software functions correctly. If you restart your Macintosh, you must perform all six steps again.

The easiest solution is to follow the directions for v.2.3. Unloading and loading the network drivers has the same affect as doing a warm boot of the DOS Card. In version 3.1 of PC/TCP, the drivers should be able to be unloaded from memory, then reloaded. If that is not the case, then a warm boot will suffice.

If for some reason you cannot unload the network drivers, this may be because "idrive" has no "unload" function. If you can possiblily load this function before the networking software, you should be able to unload all of the networking software, and not have to reboot. It is our understanding that version 3.x of ethdrv.exe does in fact support unloading network drivers from memory.

NetManage's Chameleon software has NFS volume support, and has shown to be stable in the testing we have done. Also, we have successfully used the InterCon Systems' products.

Article Change History:

05 Jul 1995 - Updated for clarity and added more information.

27 Mar 1995 - Added problem is with FTP software.

AppleShare 4.0.2: Compatibility with Empower Software (2/95)

Revised: 2/28/95
Security: Everyone

AppleShare 4.0.2: Compatibility with Empower Software (2/95)

=====

Article Created: 28 February 1995

TOPIC -----

This article describes two compatibility issues between AppleShare 4.0.2 and Empower security software.

DISCUSSION -----

There are known issues with AppleShare 4.0.2 running on Power Macintosh computers and Empower security software.

First, the computer will lockup when the Empower screen saver mode comes on. This is a known and reproducible issue with Empower.

Second, Empower can restrict access to individual folders much like file sharing does. If a user tries to access one of these restricted folders while AppleShare is running, unusual problems of an unknown nature, may occur.

For security, Apple recommends that file servers be kept behind closed and/or locked doors. This should reduce the need for security software.

MAE Compatibility 1.0 Extension Available By ftp (2/95)

Revised: 2/27/95
Security: Everyone

MAE Compatibility 1.0 Extension Available By ftp (2/95)

=====

Article Created: 27 February 1995

TOPIC -----

This article is an announcement of MAE Compatibility 1.0 Extension available by way of ftp.

DISCUSSION -----

The MAE Compatibility 1.0 extension has been designed to fix a compatibility problem between MAE 1.0a and Microsoft PowerPoint 4.0. This extension is available via anonymous ftp from the following server:

ftp.support.apple.com (130.43.6.3)

Please read the README.MAE_Compatibility file before downloading. The Extension and README are located in the following directory:

pub/mae/patches/mae_1.0a_updates

From this directory, download file MAE_Compatibility.tar by anonymous ftp (binary transfer) and un'tar it using the following UNIX command:

```
tar -xvf MAE_Compatibility.tar
```

To install, copy the "MAE Compatibility" extension to your Extensions folder (inside your System Folder) and restart MAE.

This extension should fix the problem which inhibits PowerPoint 4.0 from loading successfully under MAE.

ARA, Performa 611x, and Global Village Gold II Modem (5/95)

Revised: 5/18/95
Security: Everyone

ARA, Performa 611x, and Global Village Gold II Modem (5/95)

=====

Article Created: 27 February 1995
Article Reviewed/Updated: 18 May 1995

TOPIC -----

This article describes a problem with users of the Performa 611x computer typically choosing the wrong Apple Remote Access (ARA) connection script, GV TP Gold/Silver. This modem script does not work with the Gold II modem that ships with the Performa 611x. However, the correct connection script is on the computers hard disk.

DISCUSSION -----

The Performa 611x like most Performa computers, comes with a modem. This modem is a TelePort Gold II for Performa from Global Village. It has both 14,400 bps send and receive fax plus 14,400 bps data. This modem also requires a special connection script or CCL for ARA. Here is the hard drive path to the CCL:

Hard Disk:Applications:GV TelePort Gold II:Scripts:ARA 2.0 Script:GV TelePort Gold II for ARA 2.0

The CCL, GV TelePort Gold II for ARA 2.0, must be placed in the extensions folder within the System Folder, and chosen in the Remote Access Setup control panel for the modem to work properly with ARA.

Article Change History:
18 May 1995 - Corrected path to the CCL.

Article Created: 28 February 1995

TOPIC -----

Which Radius Pivot monitors work on the Power Macintosh? Where can I get the latest software? Is it System 7.5 compatible?

DISCUSSION -----

Radius Technical Support states that the Power Macintosh supports the following:

- Radius Precision Color Pivot displays
- Late model Radius Grayscale and Color Pivot displays

The Radius Pivot displays that are not compatible with Macintosh built-in video will not work on Power Macintosh computers, such as:

- Original Black & White SoftPivot (Model 0194)
- ColorPivot LE

For System 7.5 compatibility, customers should use version 3.2 or later of the SoftPivot control panel. The RadiusWare control panel is not System 7.5 compatible. For System 7.5 compatibility, use version 3.2 or later of Dynamic Desktop control panel.

This software is available on the Radius BBS, (408) 541-6190, and on the internet at [ftp.radius.com](ftp://ftp.radius.com).

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Pwr Mac DOS Compatibility Card: Not For 68040 Computers (2/95)

Revised: 5/24/95
Security: Everyone

Pwr Mac DOS Compatibility Card: Not For 68040 Computers (2/95)

=====

Article Created: 28 February 1995

TOPIC -----

When using the DOS Compatibility Card for Macintosh (M3581LL/A) in a Quadra series computer with System 7.5 and PowerTalk, the machine freezes at startup.

DISCUSSION -----

The DOS Compatibility Card for Power Macintosh 6100/60, 6100/66, or Performa 6100 series (M3581LL/A), was not tested on 68040-based Macintosh computers. Therefore, putting this card in a Macintosh Quadra is not a supported configuration. You should not use this card for non-Power Macintosh computers.

Your configuration may work as expected if "Auto-start PC" is not selected in the PC Setup control panel. However, Apple cannot guarantee that you will not experience problems with this unsupported configuration.

ED 3.5 Diskette Labelled As 4 MB, Formats As 800K (4/95)

Revised: 4/7/95
Security: Everyone

ED 3.5 Diskette Labelled As 4 MB, Formats As 800K (4/95)

Article Created: 28 February 1995
Article Reviewed/Updated: 7 April 1995

TOPIC -----

The Extended Density (ED) 3.5 inch floppy disk (which is labelled as 4 MB, but formats at 2.88 MB), is NOT supported on any Apple Macintosh computer as of February 1995. The floppy drive mechanism that supports this disk is primarily found in MS-DOS/Windows and UNIX workstation computers.

DISCUSSION -----

While holding the diskette with the shutter in the up position, you will notice two square holes on the disk. The one on the lower left is for locking, and the other on the lower right indicates the density.

HD (High Density) disks also have an ID hole. The HD disk ID hole is parallel to

the locking hole. The ED ID hole is offset about a 1/4 inch closer to the shutter. Since the ID hole is in a different location, the Apple SuperDrive treats the ED disk like an 800K disk, which does not have a density hole.

Power Macintosh: SoftWindows to DOS Compatibility Card (2/95)

Revised: 9/29/95
Security: Everyone

Power Macintosh: SoftWindows to DOS Compatibility Card (2/95)

=====

Article Created: 28 February 1995
Article Reviewed/Updated: 29 September 1995

TOPIC -----

I have a Power Macintosh 6100/60 running SoftWindows, and I have now purchased a DOS card. I want to maintain my applications and data files on the SoftWindows partition. PC Setup will recognize the SoftWindows partition, but when I switch to the DOS Compatibility screen I get a message saying, "Missing Operating System". How do I access the SoftWindows partition?

DISCUSSION -----

A SoftWindows/Soft PC drive file cannot be used as the C: drive for the DOS Compatibility Card. However, the SoftWindows/Soft PC drive file can be used as the D: drive. The following steps show how to access the SoftWindows/Soft PC drive file with the DOS Compatibility Card.

Step 1

Install the DOS Compatible Card software including DOS.

Step 2

Use the PC Setup control panel and choose the SoftWindows drive file for the D: drive.

Step 3

Switch to the PC and the SoftWindows/Soft PC drive file is now accessible as drive D:

Quadra 630: SAM 4.0 Compatibility (3/95)

Article Created: 01 March 1995

TOPIC -----

Are you aware of any problems with SAM 4.0 on a Quadra 630 running System 7.5?

DISCUSSION -----

Norton Technical Support states that they are not aware of any specific problems with that configuration but that there are some inherent problems with SAM 4.0. Version 4.0.1 is the update, and the current version is 4.0.2 which adds a new virus definition.

KanjiTalk: Frequently Asked Questions (11/95)

Revised: 2/13/96
Security: Everyone

KanjiTalk: Frequently Asked Questions (11/95)

Article Created: 1 March 1995
Article Reviewed/Updated: 10 November 1995

TOPIC -----

This article contains the answers to frequently asked questions (FAQ) on KanjiTalk.

Questions in this FAQ:
=====

- 1) What is KanjiTalk?
- 2) What is the Japanese Language Kit?
- 3) How much does it cost?
- 4) Who provides technical support?

DISCUSSION -----

1) Question: What is KanjiTalk?

Answer: KanjiTalk is the fully translated, Japanese version of the Macintosh operating system. All of its menus, dialog boxes and system messages are in Japanese. KanjiTalk is designed for those users who need to work in a full Japanese environment. KanjiTalk is sold and supported in Japan predominantly, but there are a few resellers in the United States who can order it for you. For more information on resellers in the United States see the Tech Info Library article titled "KanjiTalk: Authorized U.S. Dealers and VARs (3/95)".

To use your current English applications under KanjiTalk, you would need to purchase their equivalent Japanese version to ensure compatibility and smooth operation. Contact the vendor of your favorite applications to see if they offer a Japanese version.

2) Question: What is the Japanese Language Kit?

Answer: In contrast to KanjiTalk, the Apple Japanese Language Kit (JLK) is for customers who wish to exchange, edit and read Japanese documents, but work in the language of their original operating system. For example, say someone lives in Spain and once in a while exchanges Japanese files with someone in Japan. They would only need to install the JLK to read the files, but be able to operate in Spanish at all other times.

3) Question: How much does it cost?

Answer: There are several Apple dealers and Value Added Resellers (VARs) in the United States who sell KanjiTalk. They set their price for KanjiTalk, and they should be contacted for their current price. For more information on resellers in the United States see the Tech Info Library article titled "KanjiTalk: Authorized U.S. Dealers and VARs".

4) Question: Who provides technical support?

Answer: KanjiTalk is supported in Japan, and for a fee, by some third party companies such as AsiaSoft at 407-234-5366. Apple does not provide toll free KanjiTalk technical support in the United States. In contrast, Apple does provide toll free technical support for the Japanese Language Kit through 1-800-SOS-APPL.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Article Change History:

10 Nov 1995 - Updated title.

28 Jun 1995 - Added KanjiTalk support number

21 Jun 1995 - Changed article type to FAQ format.

Macintosh: Pioneer CD Requires Lower SCSI ID (3/95)

Revised: 3/1/95
Security: Everyone

Macintosh: Pioneer CD Requires Lower SCSI ID (3/95)

=====

Article Created: 1 March 1995

TOPIC -----

I installed a Pioneer DRM-600 CD changer with driver v3.0 on my Macintosh. After installing the Pioneer driver the internal CD drive can no longer be seen by the system.

DISCUSSION -----

According to Pioneer you need the 3.0 version of the driver for System 7.5 compatibility and replaces the Apple CD-ROM driver.

Pioneer has also discovered that their DRM-600 drive needs to have a lower SCSI ID than the SCSI ID of the internal CD-ROM from Apple. Apparently, this contradicts the recommendations in their read me.

If your internal CD-ROM drive is set to SCSI ID 3 (the ID set by Apple at the factory), set the Pioneer DRM-600 drive to SCSI ID 1 or 2.

For additional information on this problem, contact Pioneer.

Macintosh: RMS, Peak-to-Peak, Line Level Definitions (4/95)

Revised: 5/19/95
Security: Everyone

Macintosh: RMS, Peak-to-Peak, Line Level Definitions (4/95)

Article Created: 2 March 1995
Article Reviewed/Updated: 21 April 1995

TOPIC -----

This article contains questions and answers concerning microphones and definitions related to them.

DISCUSSION -----

Question: I am looking for information about audio input and output voltages to different Macintosh computers. Some specifications show the value in "Peak-to-Peak" while others are in "RMS" and I have also heard of a term "Line Level". What do these terms mean?

Answer: Peak-to-Peak and RMS are ways of measuring the voltage of an audio or AC signal. Line Level is an industry standard used in audio equipment.

Question: Are Peak-to-Peak and RMS the same thing? Can the terms be used interchangeably?

Answer: No. Peak-to-Peak is the measurement of any signal from the positive most peak to its negative most peak, in other words, its extremes. RMS stands for Root Means Square and it is the value of a signal's "Effective Value" or the work it can do.

Question: How do I convert from one to the other?

Answer: There are two simple equations that you can use based on the assumption that the signal is a "sine wave". They are:

To Find	Equation
-----	-----
Peak-to-Peak	$\text{RMS} * 2.828$

RMS Peak-to-peak * 0.3535

RMS is defined first by the "means" of the "square" (2) of every angle through a given wave. With sine waves the mean is 0.707 which is 1 divided by the square root of 2. Therefore, the $(1/\text{SQRT } 2)$ is the root means of the squares of all the angles.

The RMS of one half of a sine wave is 70.7% of the peak value or $[\text{Peak} * 0.707 = \text{RMS}]$.

The Peak value of a sine wave is $1/2$ of the peak-to-peak value.

Question: What is the voltage rating of "Line Level" in, RMS or Peak-to-peak?

Answer: Line Level has no voltage standard. It is actually an impedance or "Signal Resistance" value set at 47,000 Ohms. There is no way of converting this information alone into any voltage specification.

Line Level provides an industry standard so that all audio and other electronic equipment can operate properly together. Most VCRs, including both home and professional audio equipment use Line Level as a standard. They are commonly used where you find an "RCA" connector. The RCA plug looks similar to a four leafed flower with a center single conductor pole. The RCA jack usually sticks out about $1/4$ -inch from the chassis and is about $1/4$ -inch around with a $1/8$ -inch center hole.

Question: How do I convert my microphone signal to a Line Level signal?

Answer: The easiest way is to use any home audio equipment that accepts microphone inputs. Tape recorders, audio tuners, audio mixers, and video cameras are all common equipment that usually provide a microphone input.

LaserWriter 16/600 PS: PostScript For Changing Paper Tray (1/96)

Revised: 1/10/97
Security: Everyone

LaserWriter 16/600 PS: PostScript For Changing Paper Tray (1/96)

Article Created: 2 March 1995
Article Reviewed/Updated: 10 January 1997

TOPIC -----

How can I obtain the PostScript code for changing the default paper tray on the LaserWriter 16/600 PS printer?

DISCUSSION -----

The following PostScript code can be used to make changes to the default paper tray. The example below changes sets the optional 500 sheet cassette as the default.

Caution:

If you choose to use the PostScript code provided in this article, you assume all risks involved in making these changes. PostScript code, if not entered correctly, can place the LaserWriter into a condition requiring service.

Use this PostScript code at your own risk. You are responsible for the support of any problems associated with changing the default tray. You should also inform others using the printer that you have changed the default tray. Changing the default tray on the printer may cause the paper out LED to light if there is no paper present in the default tray, or if the wrong size paper is used in the tray. When this happens, there is nothing wrong with the printer's hardware.

PostScript code is case-sensitive so the information should be entered exactly as seen below.

```
%=====
% Begin PostScript code -- This is PostScript Level 2
%
serverdict begin 0 exitserver
1 dict dup /InputAttributes 1 dict dup /Priority [0 1 2] put put setpagedevice
%
```

```
% End PostScript code
%=====
```

The above code makes the 250 sheet cassette (0) the default tray to use when:

- 1) Auto Select is chosen as the Paper Source in the Print dialog AND
- 2) the 250 sheet cassette has the same paper size as set in Page Setup.

To set the 500 sheet cassette (2) as default, you would change the matrix above to [2 0 1]. To make the MultiPurpose tray (1) default, the matrix should be [1 0 2].

After downloading the code verify that the change was made by printing the configuration page. The lower left corner of the configuration page lists all of the trays, their tray numbers, and an indicator showing which one is the current default tray. The LaserWriter 8.2 driver and later provides additional paper handling features which are better suited for the Macintosh environment. Consult your LaserWriter 16/600 PS user's manual for more detailed information on the 'installed and preferred' and automatic paper tray switching capabilities.

It is important to note that the paper out LED only indicates the paper out condition in the default paper tray. If the default tray is changed, it will cause the paper out LED to stay on even though paper is in the 250 sheet cassette. Setting the default tray back to the 250 sheet cassette will restore the printer back to its default setting.

Article Change History:

- 10 Jan 1997 - Updated the PostScript code to Level 2 PostScript.
- 21 Apr 1995 - Added additional information to caution message.

Pwr Mac DOS Compatibility Card: Only Uses MS-DOS 6.x (3/95)

Revised: 5/24/95
Security: Everyone

Pwr Mac DOS Compatibility Card: Only Uses MS-DOS 6.x (3/95)

=====

Article Created: 3 March 1995

TOPIC -----

I recently tried using some older software, which required an older version of MS-DOS, with our 6100 DOS Compatible computer. I kept getting "Incompatible Version of DOS" when I tried running the application. If I tried using a disk that had the older version of MS-DOS on it, I got a "Wrong DOS Version, Cannot Load COMMAND.COM" error message. Can the DOS Compatibility Card use older versions of MS-DOS?

Also can the DOS Compatibility Card display CGA graphics on Apple Displays? When I tried the screen lost sync and the image was unusable.

DISCUSSION -----

Only DOS 6.0 and higher are supported on the DOS Compatibility Card. These versions are the only ones tested and supported. There are no plans to test older versions of MS-DOS, or try to get them running on the DOS Compatibility Card.

The problems with CGA applications is that Apple monitors do not support this display mode. The documentation for the DOS Compatibility Card explains that the VGA controller is backward compatible with EGA, CGA and MDA. But in order to use it in other modes, you need a third party monitor capable of displaying CGA graphics.

Format vs. Initialize: Difference Between Them (4/95)

Revised: 5/19/95
Security: Everyone

Format vs. Initialize: Difference Between Them (4/95)

=====

Article Created: 3 March 1995
Article Reviewed/Updated: 21 April 1995

TOPIC -----

The terms format and initialization are often used interchangeably. With regards to Apple HD SC Setup, what is the difference between format and initialization?

DISCUSSION -----

Formatting is a process that prepares a disk for storing information. Formatting can be low-level which prepares a disk by dividing it into tracks and sectors where information can be stored or high-level where only a directory is created.

Low-Level Formatting

Low-level formatting is also commonly referred to as simply formatting. During formatting, sector addresses, byte gaps, sync gaps, drivers, and partitions are created on the disk.

High-Level Formatting

High-level formatting, commonly referred to as initialization, creates a directory but does not write any sector information on to the hard drive.

This can get confusing because drive utilities vary greatly in the way they handle initialization and formatting. Apple HD SC Setup, for example, performs both initialization and formatting in the same operation while other utilities, such as SiliverLining, Norton Utilities, and FWB Hard Disk Toolkit separate initialization and formatting into two distinct operations.

The Erase Disk command from the Mac OS Finder can perform both a low-level format and a high-level format if the disk is a floppy disk. On hard drives, Erase Disk can only do a high-level format.

PowerBook: Single Serial Port and GV Teleport II Conflict (3/95)

Revised: 3/3/95
Security: Everyone

PowerBook: Single Serial Port and GV Teleport II Conflict (3/95)

=====

Article Created: 3 March 1995

TOPIC -----

Since I installed the software for my new Global Village Teleport II modem on my PowerBook 520, I can no longer print to my StyleWriter II. What's wrong? How can I fix it?

DISCUSSION -----

The Teleport II software that ships with the new Global Village Teleport II series of modems will not allow a PowerBook with a single serial port [such as: a PowerBook 200 series (Duo), PowerBook 100, PowerBook 150 or PowerBook 500 series] to print to a serial printer while the modem driver is present in the Extensions folder within the System Folder.

The Teleport II software, if present, will constantly occupy the shared port. You will get various error messages indicating that the port is busy when you attempt to print.

The only workaround we are aware of at this time is to disable the modem software every time you want to print. You can do this by either using the an extensions or startup manager control panel device to disable the modem software or by actually removing the modem extension from the Extensions folder.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor, Global Village, for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

QuickTime Installation Failed Message at Startup (9/95)

Revised: 9/1/95
Security: Everyone

QuickTime Installation Failed Message at Startup (9/95)

Article Created: 3 March 1995
Article Reviewed/Updated: 1 September 1995

TOPIC -----

My computer gives me this message each time it starts up: "QuickTime installation has failed because QuickTime was already installed." I do not understand this message because I am not trying to install anything. What is going on?

DISCUSSION -----

If your computer gives you this message each time it starts up, you have two copies of the QuickTime extension somewhere in your System Folder. You may have one in the Extensions folder and one loose in the System Folder. You may have two different versions of the QuickTime extension or two copies of the QuickTime extension that are the same version, but are named differently residing in your Extensions folder of your System Folder.

Try these two procedures to make sure you have only one copy of QuickTime in your System Folder:

Procedure 1

=====

Step 1

Open your System Folder.

Step 2

Click on the Views menu and choose By Name.

Step 3

If you see an item called QuickTime or QuickTime 2.0 loose in the System Folder, drag it to the Trash. Make sure you have disabled the "Protect System Folder"

feature in the General Controls control panel first. If you do not see an item called QuickTime, go to Procedure 2.

Step 4

Restart your computer to make sure the error message does not appear.

Procedure 2

=====

If you do not see QuickTime loose in the System Folder, open your Extensions folder. You may see one extension labeled QuickTime and one extension labeled Quicktime 2.0 or other version.

Step 1

Highlight one of the files by clicking it ONE time.

Step 2

Select "Get Info" from the File menu and check the version displayed in the Info window. Keep the later version, (for example, 2.0 is later than 1.6) and move the older one to the Trash. If they are both the same version, it does not matter which one you remove.

Step 3

Restart your computer to make sure the error message does not appear.

Many third-party CD-ROM disc games will add QuickTime when they are first installed on your computer. Some games may contain an older version of QuickTime which may replace your newer version. Any computer which comes with System 7.5 also comes with QuickTime 2.0. If your copy of QuickTime 2.0 has been replaced with an earlier version, you will need to either reinstall it from your original floppy disks or CD, or restore your system software if you have a Macintosh Performa computer.

AudioVision 14 Display: Built-In Microphone Audio Level (4/95)

Revised: 4/3/95
Security: Everyone

AudioVision 14 Display: Built-In Microphone Audio Level (4/95)

=====

Article Created: 03 March 1995
Article Reviewed/Updated: 3 April 1995

TOPIC -----

How come when I record a sound using the microphone built into the AudioVision 14 Display connected to my Quadra 630, the sound is low and full of static?

The ~AudioVision extension loads normally and all the AV options appear in the Sound control panel.

DISCUSSION -----

We recommended that customers use a PlainTalk microphone connected directly to the Macintosh 630 family computer instead of the built-in microphone on the AudioVision 14 Display. As an alternative, disabling the ~AudioVision control panel may improve the recording quality of the AudioVision 14 microphone.

The following computers are in the Macintosh 630 family: LC 630, Quadra 630, Performa 630, Performa 635, Performa 636, Performa 637, and Performa 638.

PowerBook 150: Does Not Start Up (3/96)

Revised: 3/29/96
Security: Everyone

PowerBook 150: Does Not Start Up (3/96)

Article Created: 03 March 1995
Article Reviewed/Updated: 7 August 1995

TOPIC -----

When I press the power button, my PowerBook 150 either does not start up, or flashes the display momentarily and goes blank. What is wrong?

DISCUSSION -----

Possible Causes

=====

This situation can occur when a battery is fully depleted and then left in the PowerBook without having the AC adapter connected. The battery will continue to discharge until there is not enough power left to boot the unit.

This situation can also occur when the power adapter is left attached to the computer, but no power is applied to the power adapter.

Examples

- A power strip is powered off at the end of the day.
- The power adapter is unplugged from the wall outlet, but not disconnected from the computer first.
- A wall light switch is turned off shutting off power to the wall power outlet (hence the computer's power is cut off).

Startup Procedures

=====

Users should be able to startup their PowerBook 150 by following these procedures:

Plug in the AC Adapter

If the unit starts with the AC Adapter connected, but not with the battery inserted, you need to charge the battery. If, after charging the battery, the same symptom appears, you may need to reset the power manager or replace the battery.

Reset the Power Management Circuitry

To do this, follow these steps:

Step 1

Remove the power adapter and battery from unit.

Step 2

Push the Reset button in the back of the unit with a paper clip and hold for 5 to 10 seconds.

Step 3

Attach the power adapter and push the Reset button in back again, but just briefly. You should hear a small pop from the speaker; do not be concerned.

Step 4

Push the main power button in back (large exposed button). The unit should power up.

Step 5

Charge the battery for at least 8 hours before attempting to run on battery power.

If the PowerBook powers on, the battery may be reinserted. If it fails to start, the PowerBook probably needs service.

If the machine does not start with a recharged or new battery, or does not start with the AC Adapter alone (with the battery removed), your PowerBook may need servicing. For help in obtaining service, please call 1-800-SOS-APPL or see your local Apple Authorized Service Provider.

Energy Saver Won't Work w/All Power Macintosh Models (3/95)

Revised: 3/6/95
Security: Everyone

Energy Saver Won't Work w/All Power Macintosh Models (3/95)

=====

Article Created: 6 March 1995

TOPIC -----

When I install the Apple Multiple Scan Display software on a PowerBook 200 Series computer (Duo) running System 7.1.1, everything installs fine. However, when I install the same software on a Power Macintosh 6100/66 or 7100/80/AV running System Software 7.5, the Energy Saver control panel does not install. Why not?

DISCUSSION -----

The Power Macintosh 7100/80, 8100/100 and 8100/110 computers were tested with the energy saver utility software from the Connectix Desktop Utilities which shipped with these models in the Apple Extras folder. That is the only energy saver software that should be installed onto these Power Macintosh computers.

The Apple Multiple Scan Display software will not install on any Power Macintosh computer which is running System Software 7.5. This is because the Multiple Scan Display software functionality (but not the Energy Saver Control Panel) is already included in System Software 7.5.

QuickDraw GX: PostScript Font Handling Tips (4/95)

Revised: 5/19/95
Security: Everyone

QuickDraw GX: PostScript Font Handling Tips (4/95)

=====

Article Created: 6 March 1995
Article Reviewed/Updated: 21 April 1995

TOPIC -----

This article contains some pointers about using QuickDraw GX with PostScript fonts and PostScript savvy applications.

DISCUSSION -----

Using QuickDraw GX with PostScript fonts and applications that manipulate PostScript font data can sometimes lead into some compatibility issues. First, QuickDraw GX is a new, emerging technology that not all applications can take advantage of. This article describes some procedures that let you keep QuickDraw GX installed and still use applications that do not support QuickDraw GX.

Background
=====

The following is a simplified explanation of fonts. See Font Facts in Information Alley Volume I, Issue 3 for further information on how fonts are handled on the Macintosh.

To understand how QuickDraw GX handles PostScript fonts, it is first necessary to understand how System 7, without QuickDraw GX, handles PostScript fonts. Under System 7.5, fonts are stored in the fonts folder. There are three types of fonts supported by the Mac OS:

- Bitmap
- TrueType
- PostScript

Bitmap and TrueType fonts are stored in the Fonts folder inside the System Folder. A bitmap file has a single letter A on the icon, a TrueType file has three successively smaller letter As on the icon. PostScript fonts consist of

two or more files per font -- a suitcase file that contains bitmaps and a printer outline font file.

To determine what type of font you are looking at, when in the Fonts folder, select View by Kind from the View menu. Use the same procedure to determine the type of font contained within a font suitcase. Open the suitcase and select View by Name from the View menu.

Installing QuickDraw GX and Enabling PostScript Fonts

=====

QuickDraw GX brings to PostScript fonts the same benefit TrueType has had for years - the ability to store the printer font data in the font suitcase along with the bitmap data for a PostScript font.

The benefits are:

- Less confusion about what files go with what font since the PostScript Font files (printer fonts) are no longer needed
- Consistent way of handling all fonts whether they are TrueType or PostScript

Using QuickDraw GX, you can open a suitcase and see the (printer) outline portion of the font (either TrueType or PostScript) and the bitmap portion of the font. To have this ability, QuickDraw GX must first enable the PostScript font. Enabling involves combining the bitmap and printer font files into a font suitcase.

The QuickDraw GX installer enables all PostScript fonts installed in the Fonts folder. Copies of the unmodified fonts (both suitcases and printer font files) are placed in a folder called •Archived Type 1 Fonts• inside the System Folder. The installer does not delete any fonts.

Tip #1

If you use a lot of PostScript fonts, use the QuickDraw GX customize option and install the QuickDraw GX utilities. This provides you with the latest version of the LaserWriter Utility, QuickDraw GX helper, and the Type 1 Enabler application. The Type 1 Enabler application should be used to convert any PostScript fonts you add to the system after installing QuickDraw GX. It performs the same operation as the QuickDraw GX installer, combining bitmap and PostScript font files into a font suitcase.

Using Your PostScript Fonts and the GX Helper

=====

Most of the QuickDraw-compatible applications work fine with QuickDraw GX and PostScript fonts. QuickDraw GX comes with printer drivers for most Apple printers. QuickDraw GX printer drivers check if applications support QuickDraw GX, and revert back to older QuickDraw printer features (usually referred to as compatibility mode), if applications do not support QuickDraw GX.

The programs that could take advantage of QuickDraw GX fonts, such as PageMaker, Quark XPress, Illustrator, Freehand, and FrameMaker, are not QuickDraw GX compatible yet, and often do not work in the compatibility mode. You should check with the application's vendor for QuickDraw GX compatibility information.

When using these applications with QuickDraw GX on, you get messages like "You will be unable to print since no outline fonts are present" and "Font Mismatch Helveobl..." and "No PostScript fonts are present" along with other miscellaneous messages. Usually these are applications that manipulate PostScript data (especially font data). The applications are not QuickDraw GX compatible and usually either come with their own printer drivers or make assumptions about where font data is stored (believing that PostScript fonts are still kept in separate files).

Tip #2

Use the QuickDraw GX Helper extension, installed by the Customize option in the QuickDraw GX installer, to print from non-GX compatible applications. QuickDraw GX Helper is a system extension that lets you disable QuickDraw GX desktop printing. It gives you the option to select what type of printing to use from the Apple menu. The setting is preserved by applications and is stored in the QuickDraw GX Helper preferences file in the Preferences folder.

When desktop printers are inactive, the Mac OS does not use the QuickDraw GX print driver. All printing calls are routed to the non-QuickDraw GX print driver. The non-QuickDraw GX print driver acts as if QuickDraw GX is not installed, and looks for PostScript printer outline fonts files in their previous location. The printer driver is not aware of QuickDraw GX enabled font suitcases.

Tip #3

QuickDraw GX Helper uses a non-GX printer driver, so you must re-install the PostScript font files into the Fonts folder. These are listed in the Finder as PostScript Font when you view the files by kind. This is necessary because the older printer drivers have not been updated to support the QuickDraw GX font suitcase format (created by the GX installer) that places PostScript fonts in a suitcase.

Both the PostScript font file and the new QuickDraw GX compatible suitcases can be present in the Fonts folder at the same time, and there are no performance problems, however extra disk space is required for the duplicate fonts.

You can find the original PostScript font files in either the •Archived Type 1 Fonts• folder in the System Folder, or on the original fonts disk. Do NOT copy suitcase files from the archived folder, or from fonts disks to the fonts folder -- this removes the enabled fonts required when QuickDraw GX helper is not being used. Use the Type 1 enabler application to enable and install fonts.

Tip #4

If you are using a non-Apple printer, do not use Apple print drivers. You need

to contact the manufacturer to obtain a QuickDraw GX compatible driver. There are no workarounds to use the older QuickDraw print driver unless you turn off QuickDraw GX.

Turning QuickDraw GX Off and using PostScript Fonts =====

If you have an application that does not work even with GX Helper, or have decided to wait until your applications are QuickDraw GX compatible and you turn off QuickDraw GX, you have problems using your PostScript fonts. Without QuickDraw GX, the non-QuickDraw GX Printer drivers cannot find the PostScript font data inside the enabled suitcases.

Tip #5

If you are sure you will not be using QuickDraw GX again, use the remove option in the QuickDraw GX installer to remove QuickDraw GX. The removal process cannot un-enable PostScript fonts. Copy the PostScript fonts and the other fonts files from the •Archived Type 1 Fonts• folder in the System folder or from the original fonts disk. Reinstall the fonts in their prior format -- a font suitcase of the bitmaps and a separate PostScript font (outline) file.

Apple Menu Options: Slow Initial Server Mounting (7/95)

Revised: 7/31/95
Security: Everyone

Apple Menu Options: Slow Initial Server Mounting (7/95)

=====

Article Created: 06 March 1995
Article Reviewed/Updated: 31 July 1995

TOPIC -----

I notice that when mounting a server volume with Apple Menu Options (AMO) active, it takes a particularly long time to draw the icons from that remote volume. Why is this?

DISCUSSION -----

When the option of remembering recent servers is checked in the Apple Menu Options control panel, an alias to a recently accessed server is placed in the recent servers folder. Since this server alias could potentially be navigated with hierarchical menus starting at Recent Servers:<server alias>, Apple Menu Options enumerates and caches all files and folders on the server. Up to four levels of menus could be extended (five is the maximum menu hierarchy, and the first level is used to navigate to the Recent Servers folder), so AMO acquires HFS structure information for the top four levels of folders and files. Depending on the access of the given user to this server, this can result in slow connect time.

Since each server user can have different folder access privileges to the volume, the time it takes for AMO to acquire and cache the information for one user might be vastly different from another. The Administrator with access to all folders, might experience longer waits than a user with only access to a single drop folder. Apple Menu Options will only access folder information that the user has privileges to. The interior of a drop folder cannot be seen, so nothing beyond the first level is acquired. This represents the two most extreme cases.

Another simple example between two users might be when each has access to just a single folder to store their files. One user may create a wide and deep folder structure inside their user folder. The second user may not use any folder hierarchy, but just store files at the top level. User one will have a longer connect time to the server than user two.

The width and depth of the folder structure that the user has access to on a server affects how much information AMO needs to acquire from that server.

If you wish to avoid these slowdowns, rather than disabling and removing Apple Menu Options completely, disable the Recent Servers option in the Apple Menu Options Control Panel. This enables the user to still use hierarchical menus to access Control Panels, Recent Files and Recent Applications. Aliases to servers can still be created by the user and stored somewhere other than the Apple Menu Items or a subfolder. This will keep Apple Menu Options from "exploring" the server file system.

Workgroup Server 95: Cache Optimization, Basic Formula (6/96)

Article Created: 6 March 1995
Article Reviewed/Updated: 3 June 1996

TOPIC -----

This article provides a basic formula for optimizing the cache memory on an Apple Workgroup Server (AWS) 95, which runs the A/UX operating system.

DISCUSSION -----

Formula
=====

Buffer cache = Z - VM

Begin_Table

Element	Description
Z	Total Ram - X

Where X = (Kernel=5 MB) +
(CatsearchD=1 MB for every 10,000 files).

VM Retrospect + System Software +
AppleShare Caches + Print Server +
any other Macintosh software

End_Table

IMPORTANT: These calculations assume no other UNIX processes are being started besides the ones started in the system by default. If this is not the case, add the memory requirements for those processes to the calculation of X.

NOTE: Make sure Z is greater than or equal to Buffer Cache + VM.

- The System Software value can be obtained by selecting the "About this Macintosh" option under the Apple Menu before launching AppleShare.
- The AppleShare Caches value can be obtained from the Dialog "File Server Cache Preferences" in the AppleShare Pro Admin application.

AppleShare File Sharing: Permission To See Grayed Volume (3/95)

Revised: 3/6/95
Security: Everyone

AppleShare File Sharing: Permission To See Grayed Volume (3/95)

=====

Article Created: 6 March 1995

TOPIC -----

With AppleShare file sharing a user enters the correct name and password, but can't get the volume they want. They get to the "Select the items you want to use:" window, but the volume they want is grayed out.

What permissions need to be set to let the user mount this volume?

DISCUSSION -----

Users need either See Folders or See Files permissions at the top level of the shared volume. Make Changes is not relevant in this situation.

AppleShare administrators may want to consider several strategies for the top level permissions.

- Create a group that includes all users who can access a volume, and give that group See Files and/or See Folders in the User/Group level.
- Set everyone to See Files and/or See Folders at the top level, and then provide security to each folder in the top level.

For more information on determining access levels, see Tech Info Library article "Macintosh: Determining File Sharing Access Levels."

Apple IP Gateway: Cannot See Other Clients on Same Server (5/96)

=====

Article Created: 7 March 1995
Article Reviewed/Updated: 28 May 1996

TOPIC -----

I have set up two Macintosh systems on Appletalk that use the Apple IP Gateway to get IP connections to the Internet. Both machines can connect to Internet services and visa-versa, but the machines cannot talk to each other. For example, a machine on the Internet can ping these two machines. These two machines can ping any machine on the Internet. However, neither of these two machines can ping each other. Why?

DISCUSSION -----

This issue was resolved with the IP Gateway 1.0.1 patch. This patch can be obtained from the following sources.

DOS Compatibility Card: Using TCP/Connect II for Windows (8/95)

Revised: 8/10/95
Security: Everyone

DOS Compatibility Card: Using TCP/Connect II for Windows (8/95)

Article Created: 7 March 1995
Article Reviewed/Updated: 10 August 1995

TOPIC -----

This article provides information on using TCP/Connect II for Windows with the DOS Compatibility Card for the Power Macintosh.

DISCUSSION -----

Introduction
=====

This document assumes a working knowledge of DOS and Windows. This document will focus on aspects of network software installation that deviates from normal DOS/Windows installations. This document is not a substitute for and should be used in conjunction with product documentation!

Simultaneous Macintosh and DOS networking
=====

Your Power Macintosh 6100 DOS Compatible can have simultaneously active connections in both environments, provided different networking protocols are used. You cannot have two identical protocols running in both environments. If identical protocol support in both environments is needed, the only solution at this time is to encapsulate one protocol inside a different protocol, referred to as "tunneling". For example, there are various options to have TCP/IP active on both the Macintosh and the DOS side; They all require some form of gateway to either route IP encapsulated in AppleTalk, or IP encapsulated in IPX. One solution is to set MacTCP for EtherTalk and put an Apple IP Gateway on the network.

DOS networking and Memory
=====

If you will be using the Power Macintosh 6100 DOS Compatible networking functions, it is recommended that you maximize conventional memory by removing unnecessary device drivers and TSRs. Also, load the remaining device drivers and TSRs high if possible. Windows for Workgroups 3.11 requires greater than 540K of conventional memory for it's Browser to function properly.

Windows for Workgroups: Installation considerations

=====

If you will be installing Windows for Workgroups 3.11, the Novell Netware client, AND TCP/IP support, install the NetWare client first, Windows for Workgroups 3.11 second, and the IP stack third.

ODI to NDIS translation issues

=====

Novell provides an ODI to NDIS translator called "ODINSUP.COM", which is copied to the same directory as the client software. This allows ODI drivers to be used in an NDIS environment. When using ODINSUP.COM, you must specify an interrupt in the NET.CFG file. Use the statement:

INT 6

in the Link Driver section of the NET.CFG file. Failure to do this results in the following error message:

"ERROR: "First Mac ODI MLID does not conform to the latest ODI MLID specification. Call adapter manufacturer and request a newer MLID that preserves the PIC mask bit."

For a complete discussion of ODINSUP.COM and configuration information for it, please contact Novell.

Windows for Workgroups 3.11

=====

If Windows for Workgroups 3.11 is to be installed, it is recommended that you become familiar with the protocol.ini file, which Windows for Workgroups 3.11 uses for setting up the networking environment. Without the proper entries in this file, Windows for Workgroups 3.11 networking will not function properly. The installer for Windows for Workgroups 3.11 does NOT modify the PROTOCOL.INI or NET.CFG file correctly, which means they must be manually edited. A suggested resource is the Windows for Workgroups 3.1 Resource Kit, available from Microsoft.

MACODI

=====

MACODI.COM is located on the DOS Compatibility Card Installer Disk for DOS Environment.

It is important to note that the Power Macintosh 6100 DOS Compatible does not require any special settings where networking is concerned. The DOS side functions as would any DOS machine using ODI drivers. The only special consideration is to be sure the same protocols are not running in both environments unless tunneling is used.

Binding TCP/IP protocols in NET.CFG
=====

For any TCP/IP setup, you MUST bind IP and ARP in the NET.CFG file. The only notable exception to this that we know of is FTP Software's PC/TCP. If the IP protocol stack you use requires RARP, you MUST bind this also. The entries that bind IP, ARP, and RARP will ALWAYS be the same, unless you are binding to a frame type other than Ethernet_II, which is unlikely. This is the standard IP, ARP, and RARP listing that MUST be in the NET.CFG file for IP support:

Link Driver MACODI
Frame Ethernet_II
Protocol IP 800 Ethernet_II
Protocol ARP 806 Ethernet_II
Protocol RARP 8035 Ethernet_II

As a general rule, do not add PORT or INT statements to the NET.CFG file. ODI drivers do not necessarily require them, and MACODI does not use interrupts. If using odinsup.com for NDIS compatibility, set the INT value to 6.

Example Installation and Settings Files
=====

The following are some examples of networking configurations on the Power Macintosh 6100 DOS Compatible. Note that for all of these installations, Novell Netware was loaded. Also note that defaults were selected in all of these scenarios, which may not be valid for your environment. These are included as examples only. In some situations, the installer may not respond as outlined due to differences in files loaded into memory at the time of the installation. If that occurs, proceed per the software's documentation for using the software with ODI drivers. For the sake of brevity, only portions of files specific to the discussion will be listed. For further help in setting up the various networking environments, please contact the vendor of your network operating system.

InterCon TCP/Connect II for Windows
=====

You must have successfully installed the NetWare client software and Windows before performing this step. "Successfully" means you are able to connect to a NetWare server and you are able to run Windows. Windows comes preinstalled on

the Power Macintosh 6100 DOS Compatible. If you are not able to connect to a NetWare server, check your files against those listed above. Make sure all of the programs needed (called) are in the proper location. Also, make sure you don't have networking software loaded on the Macintosh that would cause a conflict, such as MacIPX. Once you have successfully connected to a server, follow these steps to load InterCon's TCP/Connect II for Windows. Again, only the steps that deviate from standard installations will be thoroughly outlined. Please note that for this installation, Windows for Workgroups 3.11 was installed.

Step 1

Before beginning the installation, you will need to have the following information:

IP ADDRESS:

SUB-NET MASK:

DEFAULT ROUTER IP ADDRESS:

DOMAIN NAME:

DOMAIN NAME SERVER IP ADDRESS:
(If DNS services will be used)

Step 2

Follow the directions in InterCon's documentation for installing the software. The installer is self-explanatory, as is the settings it asks you for. There is nothing Power Macintosh 6100 DOS Compatible specific in the installation of this software. The Power Macintosh 6100 DOS Compatible uses ODI drivers, so that is the choice when prompted for the type of driver.

Step 3

Listed below is the NET.CFG file for TCP/Connect support. Notice that IPX is also loaded, set for 802.2 frame type. Only networking specific entries are listed in the AUTOEXEC.BAT. Note the Windows for Workgroups 3.11 entries in the AUTOEXEC.BAT are not listed, as they aren't modified by the InterCon installer.

NET.CFG

Link Driver MACODI

```
Frame Ethernet_802.2
Frame Ethernet_802.3
Frame Ethernet_SNAP
Frame Ethernet_II
PROTOCOL IPX E0 ETHERNET_802.2
PROTOCOL IP 800 ETHERNET_II
PROTOCOL ARP 806 ETHERNET_II
```

PROTOCOL RARP 8035 ETHERNET_II

Buffers 8 1600
MemPool 4095

AUTOEXEC.BAT

C:\NWCLIENT\LSL.COM
C:\NWCLIENT\MACODI.COM
C:\NWCLIENT\IPXODI.COM
C:\TCPCONN\ODIPKT.COM 3 107

For further help with installing InterCon TCP/Connect II for Windows,
please call InterCon.

Description of Files
=====

C:\NWCLIENT\LSL.COM

Link support layer driver. Supplied by Novell client software

C:\NWCLIENT\MACODI.COM

Network interface card driver. Supplied by Apple.

C:\NWCLIENT\IPXODI.COM

IPX Protocol stack layer. Supplied by Novell client software

C:\TCPCONN\ODIPKT.COM 3 107

ODI Packet driver. The first number selects the frame type from the entries in the net.cfg file. The first frame listed in the net.cfg is considered 0. Since we are using Ethernet_II, and it is the last of 4 frame types specified in the net.cfg file, this number is 3 in this example. The second number is the "line number" and should always be set to 107 for Ethernet. Supplied by InterCon software.

DOS Compatibility Card: Using LAN WorkPlace for DOS (6/95)

=====

Article Created: 7 March 1995
Article Reviewed/Updated: 29 June 1995

TOPIC -----

This article provides information on using LAN WorkPlace for DOS with the DOS Compatibility Card for the Power Macintosh.

DISCUSSION -----

This article focuses on aspects of network software installation that deviates from normal DOS/Windows installations and assumes a working knowledge of DOS and Windows. This article is not a substitute for and should be used in conjunction with product documentation!

Introduction

=====

Simultaneous Macintosh and DOS Networking

Your Power Macintosh 6100 DOS Compatible can have simultaneously active connections in both environments, provided different networking protocols are used. You cannot have two identical protocols running in both environments. If identical protocol support in both environments is needed, the only solution at this time is to encapsulate one protocol inside a different protocol, referred to as "tunneling". For example, there are various options to have TCP/IP active on both the Macintosh and the DOS side; they all require some form of gateway to either route IP encapsulated in AppleTalk, or IP encapsulated in IPX. One solution is to set MacTCP for EtherTalk and put an Apple IP Gateway on the network.

DOS Networking and Memory

If you will be using the Power Macintosh 6100 DOS Compatible networking functions, it is recommended that you maximize conventional memory by removing

unnecessary device drivers and TSRs. Also, load the remaining device drivers and TSRs high if possible. Windows for Workgroups 3.11 requires greater than 540K of conventional memory for its Browser to function properly.

Windows for Workgroups: Installation Considerations

If you will be installing Windows for Workgroups 3.11, the Novell Netware client, AND TCP/IP support, install the NetWare client first, Windows for Workgroups 3.11 second, and the IP stack third.

ODI to NDIS Translation Issues

Novell provides an ODI to NDIS translator called ODINSUP.COM, which is copied to the same directory as the client software. This lets ODI drivers be used in an NDIS environment. When using ODINSUP.COM, you must specify an interrupt in the NET.CFG file. Use the statement in the Link Driver section of the NET.CFG file:

```
INT 6
```

Failure to do this results in the following error message:

```
"ERROR: "First Mac ODI MLID does not conform to the latest ODI MLID
specification. Call adapter manufacturer and request a newer MLID that preserves
the PIC mask bit."
```

For a complete discussion of ODINSUP.COM and configuration information for it, please contact Novell.

Windows for Workgroups 3.11

=====

If Windows for Workgroups 3.11 is to be installed, it is recommended that you become familiar with the protocol.ini file, which Windows for Workgroups 3.11 uses for setting up the networking environment. Without the proper entries in this file, Windows for Workgroups 3.11 networking does not function properly. The installer for Windows for Workgroups 3.11 does NOT modify the PROTOCOL.INI or NET.CFG file correctly, which means they must be manually edited. A suggested resource is the Windows for Workgroups 3.1 Resource Kit, available from Microsoft.

MACODI

MACODI.COM is located on the DOS Compatibility Card Installer Disk for DOS Environment. It is important to note that the Power Macintosh 6100 DOS Compatible does not require any special settings where networking is concerned. The DOS side functions as would any DOS machine using ODI drivers. The only special consideration is to be sure the same protocols are not running in both environments unless tunneling is used.

Binding TCP/IP protocols in NET.CFG

For any TCP/IP setup, you MUST bind IP and ARP in the NET.CFG file. The only notable exception to this that we know of is FTP Software's PC/TCP. If the IP protocol stack you use requires RARP, you MUST bind this also. The entries that

bind IP, ARP, and RARP are ALWAYS the same, unless you are binding to a frame type other than Ethernet_II, which is unlikely. This is the standard IP, ARP, and RARP listing that MUST be in the NET.CFG file for IP support:

```
.  Link Driver MACODI
.  Frame Ethernet_II
.  Protocol IP 800 Ethernet_II
.  Protocol ARP 806 Ethernet_II
.  Protocol RARP 8035 Ethernet_II
```

As a general rule, do not add PORT or INT statements to the NET.CFG file. ODI drivers do not necessarily require them, and MACODI does not use interrupts. If using odinsup.com for NDIS compatibility, set the INT value to 10.

Example Installation and Settings Files

The following are some examples of networking configurations on the Power Macintosh 6100 DOS Compatible. Note that for all of these installations, Novell Netware was loaded. Also note that defaults were selected in all of these scenarios, which may not be valid for your environment. These are included as examples only. In some situations, the installer may not respond as outlined due to differences in files loaded into memory at the time of the installation. If that occurs, proceed per the software's documentation for using the software with ODI drivers. For the sake of brevity, only portions of files specific to the discussion will be listed. For further help in setting up the various networking environments, please contact the vendor of your network operating system.

LAN WorkPlace for DOS Setup

=====

You must have successfully installed the NetWare client software before performing this step. "Successfully" means LSL.COM and MACODI.COM are loading without errors. Make sure you do not have networking software loaded on the Macintosh that would cause a conflict, such as MacTCP. If you are going to install Windows for Workgroups 3.11, do so before performing this step. Follow these steps to load LAN WorkPlace for DOS. Again, only the steps that deviate from standard installations will be thoroughly outlined.

Step 1

Before beginning the installation, you need to have the following information:

- IP ADDRESS:
- SUB-NET MASK:
- DEFAULT ROUTER IP ADDRESS:
- DOMAIN NAME:
- DOMAIN NAME SERVER IP ADDRESS (If DNS servicess will be used):

Step 2

Run the Lan WorkPlace for DOS installer, and follow the prompts. Enter the information as it is asked. Let it modify the files for you, although you will have to modify them again.

Step 3

Edit the NET.CFG file. The version of LAN WorkPlace for DOS used in this example did not enter the proper values into the Link Driver MACODI heading of the net.cfg file, meaning you must enter them in manually. This is what it should read after editing it manually. Note that the addresses listed are for illustrative purposes ONLY. LAN WorkPlace for DOS enters the proper information under the Protocol TCPIP heading. The main concern is the Link Driver MACODI heading:

```
.  * NET.CFG (without Windows for Workgroups 3.11 installed)
.
.  Link Driver MACODI
.
.      FRAME ETHERNET 802.2
.      FRAME ETHERNET II
.      PROTOCOL IPX E0 ETHERNET 802.2
.      PROTOCOL IP 800 ETHERNET II
.      PROTOCOL ARP 806 ETHERNET II
.
.  Link Support
.
.      Buffers 8 1500
.      MemPool 4096
.
.  Protocol TCPIP
.
.      PATH SCRIPT      C:\NET\SCRIPT
.      PATH PROFILE     C:\NET\PROFILE
.      PATH LWP_CFG     C:\NET\HSTACC
.      PATH TCP_CFG     C:\NET\TCP
.      ip_router        130.43.4.1
.      ip_netmask        255.255.255.0
.      ip_address        130.43.4.45
.
.  * NET.CFG (with Windows for Workgroups 3.11 installed)
.
.  Link Driver MACODI
.
.      FRAME ETHERNET_II
.      FRAME ETHERNET_802.2
.      FRAME ETHERNET_802.3
.      FRAME ETHERNET_SNAP
.
.      PROTOCOL IPX E0 ETHERNET_802.2
.      PROTOCOL IP 800 ETHERNET_II
.      PROTOCOL ARP 806 ETHERNET_II
.
.  Link Support
.
.      Buffers 8 1500
.      MemPool 4096
.
```

```
.      Protocol  TCPIP
.
.      PATH  SCRIPT      C:\NET\SCRIPT
.      PATH  PROFILE     C:\NET\PROFILE
.      PATH  LWP_CFG      C:\NET\HSTACC
.      PATH  TCP_CFG      C:\NET\TCP
.      ip_router  130.43.4.1
.      ip_netmask 255.255.255.0
.      ip_address  130.43.4.45
```

Step 4

Save the NET.CFG file, restart the computer, and answer yes when it asks you if you want to load the TCP/IP software. Ping a known good address by typing:

ping address (where address is a known good IP address)

LAN WorkPlace for DOS modifies the autoexec.bat file by adding the following line:

```
CALL C:\LANWP.BAT
```

LANWP.BAT simply asks you if you want to load the TCP/IP transport, then loads it if you answer yes. The transport file is called TCPIP.EXE and is located in:

```
C:\NET\BIN
```

For further help with installing LAN WorkPlace for DOS, please call Novell. The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Security: Everyone

DOS Compatibility Card: Using Microsoft's TCP/IP-32 IP (4/95)

=====

Article Created: 7 March 1995
Article Reviewed/Updated: 29 June 1995

TOPIC -----

This article provides information on using Microsoft's TCP/IP-32 IP with the DOS Compatibility Card for the Power Macintosh.

DISCUSSION -----

Introduction
=====

This document assumes a working knowledge of DOS and Windows. This document will focus on aspects of network software installation that deviates from normal DOS/Windows installations. This document is not a substitute for and should be used in conjunction with product documentation!

Simultaneous Macintosh and DOS networking
=====

Your Power Macintosh 6100 DOS Compatible can have simultaneously active connections in both environments, provided different networking protocols are used. You cannot have two identical protocols running in both environments. If identical protocol support in both environments is needed, the only solution at this time is to encapsulate one protocol inside a different protocol, referred to as "tunneling". For example, there are various options to have TCP/IP active on both the Macintosh and the DOS side; They all require some form of gateway to either route IP encapsulated in AppleTalk, or IP encapsulated in IPX. One solution is to set MacTCP for EtherTalk and put an Apple IP Gateway on the network.

DOS networking and Memory
=====

If you will be using the Power Macintosh 6100 DOS Compatible networking functions, it is recommended that you maximize conventional memory by removing unnecessary device drivers and TSRs. Also, load the remaining device drivers and TSRs high if possible. Windows for Workgroups 3.11 requires greater than 540K of conventional memory for it's Browser to function properly.

Windows for Workgroups: Installation considerations

=====

If you will be installing Windows for Workgroups 3.11, the Novell Netware client, AND TCP/IP support, install the NetWare client first, Windows for Workgroups 3.11 second, and the IP stack third.

ODI to NDIS translation issues

=====

Novell provides an ODI to NDIS translator called "ODINSUP.COM", which is copied to the same directory as the client software. This allows ODI drivers to be used in an NDIS environment. When using ODINSUP.COM, you must specify an interrupt in the NET.CFG file. Use the statement:

INT 6

in the Link Driver section of the NET.CFG file. Failure to do this results in the following error message:

"ERROR: "First Mac ODI MLID does not conform to the latest ODI MLID specification. Call adapter manufacturer and request a newer MLID that preserves the PIC mask bit."

For a complete discussion of ODINSUP.COM and configuration information for it, please contact Novell.

Windows for Workgroups 3.11

=====

If Windows for Workgroups 3.11 is to be installed, it is recommended that you become familiar with the protocol.ini file, which Windows for Workgroups 3.11 uses for setting up the networking environment. Without the proper entries in this file, Windows for Workgroups 3.11 networking will not function properly. The installer for Windows for Workgroups 3.11 does NOT modify the PROTOCOL.INI or NET.CFG file correctly, which means they must be manually edited. A suggested resource is the Windows for Workgroups 3.1 Resource Kit, available from Microsoft.

MACODI

=====

MACODI.COM is located on the DOS Compatibility Card Installer Disk for DOS Environment.

It is important to note that the Power Macintosh 6100 DOS Compatible does not require any special settings where networking is concerned. The DOS side functions as would any DOS machine using ODI drivers. The only special consideration is to be sure the same protocols are not running in both environments unless tunneling is used.

Binding TCP/IP protocols in NET.CFG
=====

For any TCP/IP setup, you MUST bind IP and ARP in the NET.CFG file. The only notable exception to this that we know of is FTP Software's PC/TCP. If the IP protocol stack you use requires RARP, you MUST bind this also. The entries that bind IP, ARP, and RARP will ALWAYS be the same, unless you are binding to a frame type other than Ethernet_II, which is unlikely. This is the standard IP, ARP, and RARP listing that MUST be in the NET.CFG file for IP support:

Link Driver MACODI
Frame Ethernet_II
Protocol IP 800 Ethernet_II
Protocol ARP 806 Ethernet_II
Protocol RARP 8035 Ethernet_II

As a general rule, do not add PORT or INT statements to the NET.CFG file. ODI drivers do not necessarily require them, and MACODI does not use interrupts. If using odinsup.com for NDIS compatibility, set the INT value to 10.

Example Installation and Settings Files
=====

The following are some examples of networking configurations on the Power Macintosh 6100 DOS Compatible. Note that for all of these installations, Novell Netware was loaded. Also note that defaults were selected in all of these scenarios, which may not be valid for your environment. These are included as examples only. In some situations, the installer may not respond as outlined due to differences in files loaded into memory at the time of the installation. If that occurs, proceed per the software's documentation for using the software with ODI drivers. For the sake of brevity, only portions of files specific to the discussion will be listed. For further help in setting up the various networking environments, please contact the vendor of your network operating system.

Microsoft's TCP/IP-32 IP Protocol stack
=====

You must have successfully installed the ODI drivers and Windows for Workgroups 3.11 before performing this step. "Successfully" means you are able to connect to a server and you are able to run Windows for Workgroups 3.11. If you are not

able to connect to a server, check your files against those listed above. Make sure all of the programs needed (called) are in the proper location. Also, make sure you don't have networking software loaded on the Macintosh that would cause a conflict, such as MacIPX. Once you have successfully connected to a server, follow these steps to load Microsoft's TCP/IP-32 IP protocol stack into Windows for Workgroups 3.11. Again, only the steps that deviate from standard installations will be thoroughly outlined. It is advisable that you be thoroughly familiar with the entries in the protocol.ini before editing it. See the Windows for Workgroups 3.1 Resource Kit for a complete discussion of the protocol.ini file and its entries.

Step 1

Before beginning the installation, you will need to have the following information:

IP ADDRESS:

SUB-NET MASK:

DEFAULT ROUTER IP ADDRESS:

DOMAIN NAME:

DOMAIN NAME SERVER IP ADDRESS:
(If DNS services will be used)

Step 2

Follow the directions in Microsoft's documentation for installing the IP networking protocol. Once you have installed TCP/IP-32, Windows for Workgroups 3.11 will prompt you to restart. Don't, because you will need to edit the NET.CFG and PROTOCOL.INI files.

Step 3

Listed below are the NET.CFG and PROTOCOL.INI files for TCP/IP-32 support. Notice that IPX is also loaded. Edit your files to look similar to these, depending on your configuration. Note that the TCP/IP-32 installer cannot detect what ODI driver is being used, so it inserts "XXXX" for the driver name. Remove any redundant entries, and change "XXXX" to "MACODI".

Pwr Mac DOS Compatibility Card: Using Chameleon/NFS (6/95)

Article Created: 7 March 1995
Article Reviewed/Updated: 29 June 1995

TOPIC -----

This article provides information on using NetManage's Chameleon/NFS with the DOS Compatibility Card for the Power Macintosh.

DISCUSSION -----

Introduction

=====

This document assumes a working knowledge of DOS and Windows. This document will focus on aspects of network software installation that deviates from normal DOS/Windows installations. This document is not a substitute for and should be used in conjunction with product documentation!

Simultaneous Macintosh and DOS networking

=====

Your Power Macintosh 6100 DOS Compatible can have simultaneously active connections in both environments, provided different networking protocols are used. You cannot have two identical protocols running in both environments. If identical protocol support in both environments is needed, the only solution at this time is to encapsulate one protocol inside a different protocol, referred to as "tunneling". For example, there are various options to have TCP/IP active on both the Macintosh and the DOS side; They all require some form of gateway to either route IP encapsulated in AppleTalk, or IP encapsulated in IPX. One solution is to set MacTCP for EtherTalk and put an Apple IP Gateway on the network.

DOS networking and Memory

=====

If you will be using the Power Macintosh 6100 DOS Compatible networking functions, it is recommended that you maximize conventional memory by removing unnecessary device drivers and TSRs. Also, load the remaining device drivers and TSRs high if possible. Windows for Workgroups 3.11 requires greater than 540K of conventional memory for it's Browser to function properly.

Windows for Workgroups: Installation considerations

=====

If you will be installing Windows for Workgroups 3.11, the Novell Netware client, AND TCP/IP support, install the NetWare client first, Windows for Workgroups 3.11 second, and the IP stack third.

ODI to NDIS translation issues

=====

Novell provides an ODI to NDIS translator called "ODINSUP.COM", which is copied to the same directory as the client software. This allows ODI drivers to be used in an NDIS environment. When using ODINSUP.COM, you must specify an interrupt in the NET.CFG file. Use the statement:

INT 6

in the Link Driver section of the NET.CFG file. Failure to do this results in the following error message:

"ERROR: "First Mac ODI MLID does not conform to the latest ODI MLID specification. Call adapter manufacturer and request a newer MLID that preserves the PIC mask bit."

For a complete discussion of ODINSUP.COM and configuration information for it, please contact Novell.

Windows for Workgroups 3.11

=====

If Windows for Workgroups 3.11 is to be installed, it is recommended that you become familiar with the protocol.ini file, which Windows for Workgroups 3.11 uses for setting up the networking environment. Without the proper entries in this file, Windows for Workgroups 3.11 networking will not function properly. The installer for Windows for Workgroups 3.11 does NOT modify the PROTOCOL.INI or NET.CFG file correctly, which means they must be manually edited. A suggested resource is the Windows for Workgroups 3.1 Resource Kit, available from Microsoft.

MACODI

=====

MACODI.COM is located on the DOS Compatibility Card Installer Disk for DOS Environment.

It is important to note that the Power Macintosh 6100 DOS Compatible does not require any special settings where networking is concerned. The DOS side functions as would any DOS machine using ODI drivers. The only special consideration is to be sure the same protocols are not running in both environments unless tunneling is used.

Binding TCP/IP protocols in NET.CFG
=====

For any TCP/IP setup, you MUST bind IP and ARP in the NET.CFG file. The only notable exception to this that we know of is FTP Software's PC/TCP. If the IP protocol stack you use requires RARP, you MUST bind this also. The entries that bind IP, ARP, and RARP will ALWAYS be the same, unless you are binding to a frame type other than Ethernet_II, which is unlikely. This is the standard IP, ARP, and RARP listing that MUST be in the NET.CFG file for IP support:

Link Driver MACODI
Frame Ethernet_II
Protocol IP 800 Ethernet_II
Protocol ARP 806 Ethernet_II
Protocol RARP 8035 Ethernet_II

As a general rule, do not add PORT or INT statements to the NET.CFG file. ODI drivers do not necessarily require them, and MACODI does not use interrupts. If using odinsup.com for NDIS compatibility, set the INT value to 10.

Example Installation and Settings Files
=====

The following are some examples of networking configurations on the Power Macintosh 6100 DOS Compatible. Note that for all of these installations, Novell Netware was loaded. Also note that defaults were selected in all of these scenarios, which may not be valid for your environment. These are included as examples only. In some situations, the installer may not respond as outlined due to differences in files loaded into memory at the time of the installation. If that occurs, proceed per the software's documentation for using the software with ODI drivers. For the sake of brevity, only portions of files specific to the discussion will be listed. For further help in setting up the various networking environments, please contact the vendor of your network operating system.

NetManage's Chameleon/NFS installation
=====

You must have successfully installed the NetWare client software and Windows before performing this step. "Successfully" means LSL.COM and MACODI.COM are loading without errors. Make sure you don't have networking software loaded on

the Macintosh that would cause a conflict, such as MacTCP. Windows comes preinstalled on the Power Macintosh 6100 DOS Compatible. Follow these steps to load Chameleon/NFS. Again, only the steps that deviate from standard installations will be thoroughly outlined. Windows for Workgroups 3.11 was installed for this configuration.

Step 1

Before beginning the installation, you will need to have the following information:

IP ADDRESS:

SUB-NET MASK:

DEFAULT ROUTER IP ADDRESS:

DOMAIN NAME:

DOMAIN NAME SERVER IP ADDRESS:
(If DNS services will be used)

Step 2

Follow the directions in the NetManage manual for running the Chameleon/NFS installer, and follow the prompts. Enter the information as it is asked.

Step 3

After adding the information requested, you should go under the "Services" menu and add any other information required for your environment such as router address, DNS address, etc. When done, save the configuration, quit, and restart.

NetManage adds the following to the AUTOEXEC.BAT file:

C:\NETMANAG\NMODI

The directory listed will match whatever you told NetManage to install into.

NetManage changes the NET.CFG file, which looks like this after the Chameleon/NFS install:

NET.CFG

Link Driver MACODI

FRAME Ethernet_802.2
FRAME ETHERNET_II

PROTOCOL IP 800 ETHERNET_II
PROTOCOL ARP 806 ETHERNET_II
PROTOCOL RARP 8035 ETHERNET_II

For further help with installing NetManage's Chameleon/NFS, please call
NetManage.

DOS Compatibility Card: Using With Novell Netware (11/96)

Article Created: 7 March 1995
Article Reviewed/Updated: 14 November 1996

TOPIC -----

This article provides information on using Novell Netware with the DOS Compatibility Card for the Power Macintosh.

DISCUSSION -----

Introduction
=====

This document assumes a working knowledge of DOS and Windows. This document will focus on aspects of network software installation that deviates from normal DOS/Windows installations. This document is not a substitute for and should be used in conjunction with product documentation!

Simultaneous Macintosh and DOS networking
=====

Your Power Macintosh 6100 DOS Compatible can have simultaneously active connections in both environments, provided different networking protocols are used. You cannot have two identical protocols running in both environments. If identical protocol support in both environments is needed, the only solution at this time is to encapsulate one protocol inside a different protocol, referred to as "tunneling". For example, there are various options to have TCP/IP active on both the Macintosh and the DOS side; They all require some form of gateway to either route IP encapsulated in AppleTalk, or IP encapsulated in IPX. One solution is to set MacTCP for EtherTalk and put an Apple IP Gateway on the network.

DOS networking and Memory
=====

If you will be using the Power Macintosh 6100 DOS Compatible networking functions, it is recommended that you maximize conventional memory by removing unnecessary device drivers and TSRs. Also, load the remaining device drivers and TSRs high if possible. Windows for Workgroups 3.11 requires greater than 540K of conventional memory for it's Browser to function properly.

Windows for Workgroups: Installation considerations

=====

If you will be installing Windows for Workgroups 3.11, the Novell Netware client, AND TCP/IP support, install the NetWare client first, Windows for Workgroups 3.11 second, and the IP stack third.

ODI to NDIS translation issues

=====

Novell provides an ODI to NDIS translator called "ODINSUP.COM", which is copied to the same directory as the client software. This allows ODI drivers to be used in an NDIS environment. When using ODINSUP.COM, you must specify an interrupt in the NET.CFG file. Use the statement:

INT 6

in the Link Driver section of the NET.CFG file. Failure to do this results in the following error message:

"ERROR: "First Mac ODI MLID does not conform to the latest ODI MLID specification. Call adapter manufacturer and request a newer MLID that preserves the PIC mask bit."

For a complete discussion of ODINSUP.COM and configuration information for it, please contact Novell.

Windows for Workgroups 3.11

=====

If Windows for Workgroups 3.11 is to be installed, it is recommended that you become familiar with the protocol.ini file, which Windows for Workgroups 3.11 uses for setting up the networking environment. Without the proper entries in this file, Windows for Workgroups 3.11 networking will not function properly. The installer for Windows for Workgroups 3.11 does NOT modify the protocol.ini or net.cfg file correctly, which means they must be manually edited. A suggested resource is the Windows for Workgroups 3.1 Resource Kit, available from Microsoft.

MACODI

=====

MACODI.COM is located on the DOS Compatibility Card Installer Disk for DOS Environment.

It is important to note that the Power Macintosh 6100 DOS Compatible does not require any special settings where networking is concerned. The DOS side functions as would any DOS machine using ODI drivers. The only special consideration is to be sure the same protocols are not running in both environments unless tunneling is used.

Binding TCP/IP protocols in NET.CFG
=====

For any TCP/IP setup, you MUST bind IP and ARP in the net.cfg file. The only notable exception to this that we know of is FTP Software's PC/TCP. If the IP protocol stack you use requires RARP, you MUST bind this also. The entries that bind IP, ARP, and RARP will ALWAYS be the same, unless you are binding to a frame type other than Ethernet_II, which is unlikely. This is the standard IP, ARP, and RARP listing that MUST be in the net.cfg file for IP support:

```
Link Driver MACODI
Frame Ethernet_II
Protocol IP 800 Ethernet_II
Protocol ARP 806 Ethernet_II
Protocol RARP 8035 Ethernet_II
```

As a general rule, do not add PORT or INT statements to the net.cfg file. ODI drivers do not necessarily require them, and MACODI does not use interrupts. If using odinsup.com for NDIS compatibility, set the INT value to 10.

Example Installation and Settings Files
=====

The following are some examples of networking configurations on the Power Macintosh 6100 DOS Compatible. Note that for all of these installations, Novell Netware was loaded. Also note that defaults were selected in all of these scenarios, which may not be valid for your environment. These are included as examples only. In some situations, the installer may not respond as outlined due to differences in files loaded into memory at the time of the installation. If that occurs, proceed per the software's documentation for using the software with ODI drivers. For the sake of brevity, only portions of files specific to the discussion will be listed. For further help in setting up the various networking environments, please contact the vendor of your network operating system.

Novell Netware client software installation

When installing the NetWare client software, the main install screen lists 6 options. Option 5 is specific to the Power Macintosh 6100 DOS Compatible and is the only one that deviates from standard installations.

Step 1

Scroll down to option 5. and press enter to see the list of network interface card (NIC) drivers from which to choose.

Step 2

Scroll down (or click "ot") to "OTHER DRIVERS" and press enter.

Step 3

If you are installing the NetWare client software from CD-ROM, insert the disk labelled "DOS Compatibility Card Installer Disk for DOS Environment" and hit enter. If you are installing the NetWare client software from floppy, hit command-e to eject the disk that's in the drive, insert the above mentioned disk, and hit enter.

Step 4

Hit enter on "Power Macintosh 6100 Ethernet Adapter"

Step 5

It will ask you what frame type you want, follow the prompts to select the proper frame type.

At this point, everything else is standard - follow the prompts on the screen to finish the installation. The following lists the config.sys, autoexec.bat, startnet.bat, and net.cfg files after installing the NetWare client on a stock Power Macintosh 6100 DOS Compatible. These files were modified by the NetWare client installer. In addition, "yes" was entered to "install Windows support" and "let the installer modify files" on the NetWare client installer screen. This install was performed from the Novell Netware 3.12 CD-ROM. For further help with installing Novell Netware client software, please call Novell.

Pwr Mac DOS Compatibility Card: Using Trumpet Winsock (9/95)

=====

Article Created: 7 March 1995
Article Reviewed/Updated: 14 September 1995

TOPIC -----

This article provides information on using Trumpet Winsock with the DOS Compatibility Card for the Power Macintosh.

DISCUSSION -----

Introduction
=====

This document assumes a working knowledge of MS-DOS and Windows. This document will focus on aspects of network software installation that deviates from normal DOS/Windows installations. This document is not a substitute for the documentation provided with the DOS Compatibility Card and Trumpet Winsock. These instructions should be used in conjunction with other product documentation.

Simultaneous Macintosh and DOS networking
=====

Your Power Macintosh 6100 DOS Compatible can have simultaneously active connections in both environments, provided different networking protocols are used. You cannot have two identical protocols running in both environments. If identical protocol support in both environments is needed, the only solution at this time is to encapsulate one protocol inside a different protocol, referred to as "tunneling". For example, there are various options to have TCP/IP active on both the Macintosh and the DOS side; They all require some form of gateway to either route IP encapsulated in AppleTalk, or IP encapsulated in IPX. One solution is to set MacTCP for EtherTalk and put an Apple IP Gateway on the network.

DOS networking and Memory

=====

If you will be using the Power Macintosh 6100 DOS Compatible networking functions, it is recommended that you maximize conventional memory by removing unnecessary device drivers and TSRs. Also, load the remaining device drivers and TSRs high if possible. Windows for Workgroups 3.11 requires greater than 540K of conventional memory for it's Browser to function properly.

Windows for Workgroups: Installation considerations

=====

If you will be installing Windows for Workgroups 3.11, the Novell Netware client, AND TCP/IP support, install the NetWare client first, Windows for Workgroups 3.11 second, and the IP stack third.

ODI to NDIS translation issues

=====

Novell provides an ODI to NDIS translator called "ODINSUP.COM", which is copied to the same directory as the client software. This allows ODI drivers to be used in an NDIS environment. When using ODINSUP.COM, you must specify an interrupt in the NET.CFG file. Use the statement:

INT 6

in the Link Driver section of the NET.CFG file. Failure to do this results in the following error message:

"ERROR: "First Mac ODI MLID does not conform to the latest ODI MLID specification. Call adapter manufacturer and request a newer MLID that preserves the PIC mask bit."

For a complete discussion of ODINSUP.COM and configuration information for it, please contact Novell.

Windows for Workgroups 3.11

=====

If Windows for Workgroups 3.11 is to be installed, it is recommended that you become familiar with the protocol.ini file, which Windows for Workgroups 3.11 uses for setting up the networking environment. Without the proper entries in this file, Windows for Workgroups 3.11 networking will not function properly. The installer for Windows for Workgroups 3.11 does NOT modify the PROTOCOL.INI or NET.CFG file correctly, which means they must be manually edited. A suggested resource is the Windows for Workgroups 3.1 Resource Kit, available from Microsoft.

MACODI

=====

MACODI.COM is located on the DOS Compatibility Card Installer Disk for DOS Environment.

It is important to note that the Power Macintosh 6100 DOS Compatible does not require any special settings where networking is concerned. The DOS side functions as would any DOS machine using ODI drivers. The only special consideration is to be sure the same protocols are not running in both environments unless tunneling is used.

Binding TCP/IP protocols in NET.CFG
=====

For any TCP/IP setup, you MUST bind IP and ARP in the NET.CFG file. The only notable exception to this that we know of is FTP Software's PC/TCP. If the IP protocol stack you use requires RARP, you MUST bind this also. The entries that bind IP, ARP, and RARP will ALWAYS be the same, unless you are binding to a frame type other than Ethernet_II, which is unlikely. This is the standard IP, ARP, and RARP listing that MUST be in the NET.CFG file for IP support:

```
Link Driver MACODI
Frame Ethernet_II
Protocol IP 800 Ethernet_II
Protocol ARP 806 Ethernet_II
Protocol RARP 8035 Ethernet_II
```

As a general rule, do not add PORT or INT statements to the NET.CFG file. ODI drivers do not necessarily require them, and MACODI does not use interrupts. If using odinsup.com for NDIS compatibility, set the INT value to 6.

Example Installation and Settings Files
=====

The following are some examples of networking configurations on the Power Macintosh 6100 DOS Compatible. Note that for all of these installations, Novell Netware was loaded. Also note that defaults were selected in all of these scenarios, which may not be valid for your environment. These are included as examples only. In some situations, the installer may not respond as outlined due to differences in files loaded into memory at the time of the installation. If that occurs, proceed per the software's documentation for using the software with ODI drivers. For the sake of brevity, only portions of files specific to the discussion will be listed. For further help in setting up the various networking environments, please contact the vendor of your network operating system.

Trumpet WinSock
=====

You must have successfully installed the NetWare client software and Windows before performing this step. "Successfully" means you are able to connect to a

NetWare server and you are able to run Windows. Windows comes pre-installed on the Power Macintosh 6100 DOS Compatible. If you are not able to connect to a NetWare server, check your files against those listed above. Make sure all of the programs needed (called) are in the proper location. Also, make sure you do not have networking software loaded on the Macintosh that would cause a conflict, such as MacIPX. Once you have successfully connected to a server, follow these steps to load Trumpet WinSock. Again, only the steps that deviate from standard installations will be thoroughly outlined. Please note that for this installation, Windows for Workgroups 3.11 was installed. Note the Windows for Workgroups 3.11 entries in the AUTOEXEC.BAT are not listed, as they are not modified by the Trumpet WinSock.

Step 1

Before beginning the installation, you will need to have the following information:

IP ADDRESS:

SUB-NET MASK:

DEFAULT ROUTER IP ADDRESS:

DOMAIN NAME:

DOMAIN NAME SERVER IP ADDRESS:
(If DNS services will be used)

Step 2

This document assumes you have gathered all the pieces necessary for Trumpet WinSock install.

Step 3

For the sake of brevity, it is assumed that all Trumpet WinSock files are in the same directory. In this example, the files are located in C:\TRUMPET. Since there is no installer for Trumpet Winsock, edit the NET.CFG and whatever batch file you use to call the networking software to match the files listed below.

NET.CFG

Link Driver MACODI

```
Frame Ethernet_802.2
Frame Ethernet_802.3
Frame Ethernet_SNAP
Frame Ethernet_II
PROTOCOL IPX E0 ETHERNET_802.2
PROTOCOL IP 800 ETHERNET_II
PROTOCOL ARP 806 ETHERNET_II
PROTOCOL RARP 8035 ETHERNET_II
```

LINK SUPPORT
Max Stacks 8
Buffers 8 1600
MemPool 4095

AUTOEXEC.BAT

C:\NWCLIENT\LSL.COM
C:\NWCLIENT\MACODI.COM
C:\NWCLIENT\IPXODI.COM
C:\TRUMPET\ODIPKT.COM 3 107
C:\TRUMPET\WINPKT.COM 107

Description of Files
=====

LSL.COM

Link support layer driver. Supplied by Novell client software.

MACODI.COM

Network interface card driver. Supplied by Apple.

IPXODI.COM

IPX Protocol stack layer. Supplied by Novell client software.

ODIPKT.COM 3 107

ODI Packet driver. The first number selects the frame type from the entries in the net.cfg file. The first frame listed in the net.cfg is considered 0. Since we are using Ethernet_II, and it is the last of 4 frame types specified in the net.cfg file, this number is 3 in this example. The second number is the "line number" and should always be set to 107 for Ethernet.

C:\TRUMPET\WINPKT.COM 107

Windows Virtual Packet Driver. Takes the line number as an argument. Must be the same as the line number for the packet driver.

DOS Compatibility Card: Using Windows for Workgroups 3.11 (6/95)

Revised: 6/29/95
Security: Everyone

DOS Compatibility Card: Using Windows for Workgroups 3.11 (6/95)

=====

Article Created: 7 March 1995
Article Reviewed/Updated: 29 June 1995

TOPIC -----

This article provides information on using Microsoft's Windows for Workgroups 3.11 with the DOS Compatibility Card for the Power Macintosh.

DISCUSSION -----

Introduction
=====

This document assumes a working knowledge of DOS and Windows. This document will focus on aspects of network software installation that deviates from normal DOS/Windows installations. This document is not a substitute for and should be used in conjunction with product documentation!

Simultaneous Macintosh and DOS networking
=====

Your Power Macintosh 6100 DOS Compatible can have simultaneously active connections in both environments, provided different networking protocols are used. You cannot have two identical protocols running in both environments. If identical protocol support in both environments is needed, the only solution at this time is to encapsulate one protocol inside a different protocol, referred to as "tunneling". For example, there are various options to have TCP/IP active on both the Macintosh and the DOS side; They all require some form of gateway to either route IP encapsulated in AppleTalk, or IP encapsulated in IPX. One solution is to set MacTCP for EtherTalk and put an Apple IP Gateway on the network.

DOS networking and Memory
=====

If you will be using the Power Macintosh 6100 DOS Compatible networking functions, it is recommended that you maximize conventional memory by removing unnecessary device drivers and TSRs. Also, load the remaining device drivers and TSRs high if possible. Windows for Workgroups 3.11 requires greater than 540K of conventional memory for it's Browser to function properly.

Windows for Workgroups: Installation considerations

=====

If you will be installing Windows for Workgroups 3.11, the Novell Netware client, AND TCP/IP support, install the NetWare client first, Windows for Workgroups 3.11 second, and the IP stack third.

ODI to NDIS translation issues

=====

Novell provides an ODI to NDIS translator called "ODINSUP.COM", which is copied to the same directory as the client software. This allows ODI drivers to be used in an NDIS environment. When using ODINSUP.COM, you must specify an interrupt in the NET.CFG file. Use the statement:

INT 6

in the Link Driver section of the NET.CFG file. Failure to do this results in the following error message:

"ERROR: "First Mac ODI MLID does not conform to the latest ODI MLID specification. Call adapter manufacturer and request a newer MLID that preserves the PIC mask bit."

For a complete discussion of ODINSUP.COM and configuration information for it, please contact Novell.

Windows for Workgroups 3.11

=====

If Windows for Workgroups 3.11 is to be installed, it is recommended that you become familiar with the protocol.ini file, which Windows for Workgroups 3.11 uses for setting up the networking environment. Without the proper entries in this file, Windows for Workgroups 3.11 networking will not function properly. The installer for Windows for Workgroups 3.11 does NOT modify the protocol.ini or net.cfg file correctly, which means they must be manually edited. A suggested resource is the Windows for Workgroups 3.1 Resource Kit, available from Microsoft.

MACODI

=====

MACODI.COM is located on the DOS Compatibility Card Installer Disk for DOS Environment.

It is important to note that the Power Macintosh 6100 DOS Compatible does not require any special settings where networking is concerned. The DOS side functions as would any DOS machine using ODI drivers. The only special consideration is to be sure the same protocols are not running in both environments unless tunneling is used.

Binding TCP/IP protocols in NET.CFG
=====

For any TCP/IP setup, you MUST bind IP and ARP in the net.cfg file. The only notable exception to this that we know of is FTP Software's PC/TCP. If the IP protocol stack you use requires RARP, you MUST bind this also. The entries that bind IP, ARP, and RARP will ALWAYS be the same, unless you are binding to a frame type other than Ethernet_II, which is unlikely. This is the standard IP, ARP, and RARP listing that MUST be in the net.cfg file for IP support:

Link Driver MACODI
Frame Ethernet_II
Protocol IP 800 Ethernet_II
Protocol ARP 806 Ethernet_II
Protocol RARP 8035 Ethernet_II

As a general rule, do not add PORT or INT statements to the net.cfg file. ODI drivers do not necessarily require them, and MACODI does not use interrupts. If using odinsup.com for NDIS compatibility, set the INT value to 10.

Example Installation and Settings Files
=====

The following are some examples of networking configurations on the Power Macintosh 6100 DOS Compatible. Note that for all of these installations, Novell Netware was loaded. Also note that defaults were selected in all of these scenarios, which may not be valid for your environment. These are included as examples only. In some situations, the installer may not respond as outlined due to differences in files loaded into memory at the time of the installation. If that occurs, proceed per the software's documentation for using the software with ODI drivers. For the sake of brevity, only portions of files specific to the discussion will be listed. For further help in setting up the various networking environments, please contact the vendor of your network operating system.

Windows for Workgroups 3.11 installation
=====

This assumes you are starting with a standard configuration; ie. Windows 3.1 is already on the machine. If you have not installed the NetWare client, do so before this step. Detail are listed only for the steps that deviate from the

standard Windows for Workgroups 3.11 install.

Step 1

Run the Windows for Workgroups 3.11 installer and select the express setup.

Step 2

When you get to the Network Setup, click "Advanced", then click "Drivers", then click "Add Adapter", then scroll down the list that's displayed and highlight "IPXODI Support Driver (Ethernet)" and click "OK".

Step 3

Click on the "IPX/SPX Compatible Transport With NetBIOS" and click "Setup". Click "Frame Type", select the proper frame type for your application, and click OK.

Step 4

Set the default protocol and click "Close" to continue with the installation.

Step 5

After entering the information on the next screen, it will ask you if you want to replace the Novell Netware drivers. Answer NO.

That's it - the installer will take care of the rest.

Windows for Workgroups 3.11 adds two commands to the AUTOEXEC.BAT file. One is "net start" which initializes Windows for Workgroups 3.11's network functions. The second is "odihlp.exe" which is Microsoft's ODI to NDIS mapper. Since Microsoft's networking functions work with NDIS drivers only, ODI drivers must be translated to NDIS. Microsoft's translator is supported by Microsoft, not Apple.

For further help with installing Windows for Workgroups 3.11, please call Microsoft. For further reading on Windows for Workgroups 3.11, a suggested resource is the Microsoft Windows for Workgroups 3.11 Resource Kit available from Microsoft or your local book seller.

Here's a listing of the net.cfg, autoexec.bat, and protocol.ini file after the above Windows for Workgroups 3.11 install, with a Frame type of ETHERNET_802.2 selected. Note that NetBeui was NOT installed in this listing:

Apple Media Tool: How To Create a Slide Show (4/95)

Revised: 6/5/96
Security: Everyone

Apple Media Tool: How To Create a Slide Show (4/95)

=====

Article Created: 7 March 1995
Article Reviewed/Updated: 7 April 1995

TOPIC -----

This article describes how to create a slide show presentation using the Apple Media Tool.

DISCUSSION -----

Step 1 - The Basics

Launch the Apple Media Tool application program and create one screen. Import the media, place the media inside the screen (creating objects), and align the coordinates for each object.

Note:

This article assumes you already know how to import media, create a screen, align coordinates, change actions, create commands, change commands, and other basic media tool procedures. If you do not know how to do this, please refer to the user's manual.

Step 2 - Setting duration times

You need to set the length of time you want each object to appear on the screen. This is done using the duration command in the object menu. Highlight the object for which you want to set the duration, then go to the object menu and select Duration. A window opens showing you the name of the object you have selected as well as On and Off buttons. Click the On button and enter a duration time in ticks (60 ticks = 1 second). Once you set the duration, click OK. Do this for each object you want in your sequence.

Step 3 - Assigning commands for the objects

Here is a chart of the action/commands for each object:

	Before Display	Finished
	-----	-----
Object 1	Disable itself	Hide itself
.	Show itself	Show obj. 2
.	Start itself	Start obj. 2
Object 2	Disable itself	Hide itself
.	Hide itself	Show obj. 3
.		Start obj. 3
Object 3	Disable itself	Hide itself
.	Hide itself	Show obj. 4
.		Start obj. 4
Object 4	Disable itself	Hide itself
.	Hide itself	Show obj. 5
.		Start obj. 5
Object 5	Disable itself	-----
.	Hide itself	

Note:

The reason the finished action and the start command is used (usually for movies), is because once you assign a duration to an object, the media tool treats it similarly to the way it treats a movie.

Once you have assigned the commands for the objects, you are finished. Close the screen window, and run the presentation.

This article only provides the groundwork for creating a simple slide show project. Once you are comfortable with the procedure, you can add effects and change the duration to suit your needs.

Macintosh Performa: Where is CloseView? (4/95)

Revised: 5/19/95
Security: Everyone

Macintosh Performa: Where is CloseView? (4/95)

Article Created: 7 March 1995
Article Reviewed/Updated: 21 April 1995

TOPIC -----

Is the CloseView control panel software preinstalled in the Control Panels folder on all Macintosh Performa computers?

If it is not, how can I install it? Is it inside another folder somewhere on a disk or on the hard drive?

Is there any difference between installing CloseView on a computer running System 7.5 and installing it on any other version of the Macintosh Performa system software?

DISCUSSION -----

CloseView is not installed in the Control Panels of the active System Folder on Macintosh Performa computers. It is included in the Apple Extras folder on the hard drive.

Installation of CloseView is easy from within the Finder. There is no installer, so you can just drag the CloseView icon on top of your System Folder.

If you are using At Ease, you need to launch the Finder before you can install CloseView.

Installing CloseView:

Step 1
Open the hard drive.

Step 2
Open the folder called Apple Extras.

Step 3

Click on the CloseView icon and hold the mouse button down.

Step 4

Drag the CloseView icon on top of the System Folder and release the mouse button.

Step 5

An alert box appears telling you that CloseView will be placed in Control Panels. Click the OK button.

Step 6

Pull down the Apple Menu and open Control Panels.

Step 7

Open the CloseView control panel and make the necessary changes to turn on and configure CloseView the way you want it.

Step 8

Close the CloseView control panel.

Installation is the same for System 7.5 and other Performa computers assuming that the user is working within the Finder.

Can a Diskette Have a Capacity of 2 MB (3/95)

Revised: 3/7/95
Security: Everyone

Can a Diskette Have a Capacity of 2 MB (3/95)

=====

Article Created: 7 March 1995

TOPIC -----

Does a Macintosh format HD (High Density) floppy disks from 3 MB or hold 2 MB of data?

DISCUSSION -----

A 2 MB Floppy can be perceived in one of two ways:

- 2 MB is the unformatted rated capacity of an HD diskettes. Once a 2 MB unformatted diskette is formatted, its capacity is 1.44 MB. These diskettes may have the "HD" logo impressed on the diskette somewhere, and there are two holes at the rear, or on the side opposite the diskette shutter, that are read by the drive mechanism to identify a diskette as an HD diskette.
- There is another format that has recently been release called ED (Extended Density). This diskette has an unformatted rated capacity of 4 MB, and a formatted capacity of 2.88 MB. As of March, 1995 Apple does NOT manufacture computers that read or write to this format. These drives are found in the PC marketplace primarily.

Global Village Mercury Problem Receiving Faxes (3/95)

=====

Article Created: 7 March 1995

TOPIC -----

I cannot receive Faxes with my Global Village Mercury modem. What can I do to fix this?

DISCUSSION -----

If you cannot receive Faxes with a Global Village Mercury, please check the following:

- Make sure the modem is set to answer Faxes.
- Make sure the modem status box reads Ready to answer Fax calls. If it does not, turn the modem off and turn it back on from the control panel.

Macintosh: Lose AppleTalk When Printing To StyleWriter (3/95)

Revised: 3/7/95
Security: Everyone

Macintosh: Lose AppleTalk When Printing To StyleWriter (3/95)

=====

Article Created: 7 March 1995

TOPIC -----

When I try to configure my Color StyleWriter 2400 using the chooser I get a message that reads, "Access to current network services will have to be reestablished. Are you sure you want to make it inactive?"

The problem only occurs when I try to use the printer port, but everything works fine when using the modem port. I am using the Ethernet port for networking so the printer port should be available for other uses. What is the problem and how do I correct it?

DISCUSSION -----

In many cases a software control panel extension creates this conflict. The LaserWriter Bridge software by Sonic Systems is a control panel which is provided with the LaserWriter Select 360 printer and is probably preventing the printer port configuration from being changed unless AppleTalk is turned off first. The LaserWriter Bridge software resides in the control panels folder and allows a networked LocalTalk device such as the LaserWriter Select 360 to be visible on an Ethernet network. Apple ships the LaserWriter Bridge software with all LaserWriter Select 360 printers so it is possible that the LaserWriter Bridge was installed on one or more of these systems. The software can be turned off from within the control panel itself, but the system must be restarted for the changes to take effect. If the LaserWriter Bridge software features are not required then simply turning it off from within the control panel will allow the printer port to be used with the Color StyleWriter 2400, Color StyleWriter Pro, StyleWriter II, and other serial based printers.

Portable StyleWriter: Configurable DIP Switch Settings (3/95)

Revised: 3/8/95
Security: Everyone

Portable StyleWriter: Configurable DIP Switch Settings (3/95)

Article Created: 8 March 1995

TOPIC -----

I need to get the dip switch settings for the Portable StyleWriter.

DISCUSSION -----

The are 11 configurable DIP switches. Depending on the position of DIP switches 10 and 11, the meaning of switches 6 to 10 change, so the following list includes the values of these switches first. The rest of this article describes the remaining options.

DIP Switches 10 and 11
=====

. SW 10 and 11 Sets Printer Modes	SW 10	SW 11
. -----	-----	-----
. BJ-10e (IBM Proprinter X24E (default))	OFF	OFF
. BJ-10e (Canon BJ-130e)	ON	OFF
. LQ Epson LQ-510	—	ON

BJ10e Emulation Mode
=====

If the printer is in BJ-10e emulation mode then the following switch settings are used.

. Dip	Function	ON	OFF	NOTES
. ---	-----	-----	-----	-----
. 1	AutoSheetFeeder	Enable	Disable	A
. 2	TextScale	Enable	Disable	B
. 3	Automaticlinefeed	CR=CR+LF	CR=CR	C
. 4	Page length	305 mm	279 mm	D

.		(12")	(11")	
.	5	Character set	Set 2	Set 1
.	6	Automatic carriage return	LF = LF+CR	LF=LF E
.	7	Alternate Graphics Mode (AGM)	Enable	Disable F
.	8	Receivebuffer/download buffer	3K/34K	37K/OK G
.	9	Code page	Multilingual	USA437 H
.		850		
.	10	Printer emulation	BJ-130e	X24E s

NOTES:

A) Set this switch to ON if the optional Auto Sheet Feeder is used.

B) When this switch is ON, the printer will reduce the line spacing by a factor of 29/30 (from 63 lines/page to 66 lines/page if line spacing is set to 1/6). If you want to print on letter-size paper with 6 lines/inch line spacing and 66 lines/page, set this switch to ON. This _ function is available only when line spacing is 1/6 or 1/8.

C) When this switch is ON, the printer automatically adds a linefeed (LF) code when it receives a carriage return (CR) code.

D) When this switch is OFF, the page length is 11 inches -- the appropriate length for using letter-size paper. When this switch is ON, the page length is 12 inches -- the appropriate length for using A4-size paper.

E) When this switch is ON, the printer automatically adds a carriage return (CR) code when it receives a linefeed (LF) code.

F) When AGM (Alternate Graphics Mode) is enabled, the printer accepts high resolution 2; dot all-point-addressable graphics commands similar to those used with conventional 24-pin printers.

G) When this switch is ON, the printer allocates 34K bytes of buffer for downloaded fonts. Change this setting to ON when using downloaded fonts.

H) Select multilingual code page 850 for European character set.

LQ (Laser Quality) Mode

=====

If the printer is in LQ emulation mode then the following switch settings are used.

.	Dip	Function	ON	OFF	NOTES
.	---	-----	-----	-----	-----
.	1	AutoSheetFeeder	Enable	Disable	I
.	2	TextScale	Enable	Disable	J
.	3	Automaticlinefeed	CR=CR+LF	CR=CR	K
.	4	Page length	305 mm	279 mm	L
.			(12")	(11")	

. 5 Character set Set 2 Set 1
. 6 \
. 7 >International character set (see the table following the notes)
. 8 /
. 9 \ Font selection (see the Font Selection Table below)
. 10 /

NOTES:

I) Set this switch to ON if the optional Auto Sheet Feeder is used.

J) When this switch is ON, the printer reduces the line spacing by a factor of 29/30 (from 63 lines/page to 66 lines/page if line spacing is set to 1/6). If you want to print on letter-size paper with 6 lines/inch line spacing and 66 lines/page, set this switch to ON. This function is available only when line spacing is 1/6 or 1/8.

K) When this switch is ON, the printer automatically adds a linefeed (LF) code when it receives a carriage return (CR) code.

L) When this switch is OFF, the page length is 11 inches -- the appropriate length for using letter-size paper. When this switch is ON, the page length is 12 inches -- the appropriate length for using A4-size paper.

Switches 6-7-8 International Character Set Table

. Character Set	SW6	SW7	SW8
. -----	---	---	---
. USA	OFF	OFF	OFF
. UK	OFF	OFF	ON
. Germany	OFF	ON	OFF
. France	OFF	ON	ON
. Denmark	ON	OFF	OFF
. Sweden	ON	OFF	ON
. Italy	ON	ON	OFF
. Spain	ON	ON	ON

Font Selection Table

If the application specifies use of a different font, then that font is used for printing, and the font table settings are ignored.

. Font	SW9	SW10
. -----	---	----
. Roman	OFF	OFF
. Sans Serif	OFF	ON
. Draft	ON	N/A (See Note)

NOTE: When switch 9 is ON, the painter is always in economy mode, regardless of the status of the DIP switch 10.

Apple Wireless Messaging Service: No Area Code In PIN (3/95)

Revised: 3/8/95
Security: Everyone

Apple Wireless Messaging Service: No Area Code In PIN (3/95)

=====

Article Created: 8 March 1995

TOPIC -----

I am using the Apple Wireless Messaging Service to send and receive pages. However, when the Notify software dials the paging service number and connects, an error message appears. The error states that the PIN (Personal Identification Number) or Service is not correct in the Pager Address. When opening the returned message an error appears that states "This letter could not be delivered to the marked addresses." I know I entered my PIN correctly.

DISCUSSION -----

The User's Manual has an error. You are not required to use your area code as part of your PIN. Your PIN is your beeper number (7-digit number).

LaserWriter Fax: Customizing The Fax Cover Sheet (10/95)

Revised: 10/6/95
Security: Everyone

LaserWriter Fax: Customizing The Fax Cover Sheet (10/95)

Article Created: 8 March 1995
Article Reviewed/Updated: 6 October 1995

TOPIC -----

I have a LaserWriter 16/600 PS with an optional PostScript fax card and want to easily customize the cover pages - adding company logo, changing English text to French and so forth. We also need to modify the date format so it makes sense to French Canadians, which, is in month day year format with commas instead of slashes.

- 1) Can you help with the format of the date on the cover page.
- 2) How can I change the English text to French.
- 3) Is there any outlook for a software solution to the problem of cover pages with LaserWriter 8f software?

DISCUSSION -----

Using the "Alternate Cover Page.PS" file that is installed with the LaserWriter Fax software, here is how to change the date to month-day-year format with commas instead of slashes. This change is very easy and can be performed by the following:

- 1) Open the "Alternate Cover Page.PS" file from SimpleText.
- 2) Look for the following two lines of PostScript:

```
TimeSent 1 G str cvs S ( ) S  
TimeSent 2 G str cvs S ( ) S
```

- 3) Change the "/" character inside the parenthesis to a comma. (,)

The lines should look like:

```
TimeSent 1 G str cvs S (,) S
TimeSent 2 G str cvs S (,) S
```

4) Save the file.

5) Select the file as your cover page in the Fax Cover Page dialog that comes up when faxing a document. In the Fax Cover Page dialog, click on the "Cover Page To Use" popup field and select the file you saved.

Changing English Text Into Another Language

=====

You can change the English text to French, by doing the following:

1) Open the "Alternate Cover Page.PS" file from SimpleText

.

2) Around the middle of the 5th page, look for the line:

% Program:

3) Beyond this point, you will see the text that actually appears on fax cover sheet. The text will be enclosed in parenthesis, and can be modified to anything you want - in your case this can be French. The parenthesis must remain, but the text inside can be modified. Here are the strings that can be changed:

```
(Facsimile Transmission)
(To:)
(Organization:)
(Fax Number:)
(From:)

(Pages:)
(, excluding cover sheet.)
```

Caution:

You need to be very careful about the length of the replacement text. Make sure that it is not too much longer than the original english text or it will overwrite the data in the fields.

4) Save the file.

5) Select this file as your cover page in the Fax Cover Page dialog that comes up when faxing a document. In the Fax Cover Page dialog, click on the "Cover Page To Use" popup field and select the file you saved.

Adding a logo to the Cover Sheet

=====

You can add a logo to the cover page by following the process described in the TIL article "LaserWriter Fax: Adding a Logo to The Fax Cover Sheet".

Apple MessagePad: What Items Get Erased (6/95)

Revised: 6/13/95
Security: Everyone

Apple MessagePad: What Items Get Erased (6/95)

Article Created: 9 March 1995
Article Reviewed/Updated: 13 June 1995

TOPIC -----

I am confused on how to properly erase information and what gets erased from my Apple MessagePad. I performed erase procedure outlined on page 110 of the MessagePad 120 Handbook, and now I cannot find the Notion package that came on my Apple MessagePad. The Handbook states "This does not remove Newton's programs or operating system software (including system updates)." Is this correct?

DISCUSSION -----

The handbook is a bit confusing on this topic.

After Erasing Your Messagepad

These Files Remain:

- The Calendar
- To Do List
- Notes
- Names programs
- Newton operating system
- system updates

These Files are Erased:

- Notions
- Notions templates
- Newton Mail modules
- PackageMover
- other installed programs
- all data in the internal memory

NOTE: Information on any storage card is unaffected when you erase.

How To Erase Your Apple MessagePad

Step 1

Press and hold down the Power switch.

Step 2

Press and release the Reset button while holding down the Power switch.

Step 3

Continue to hold down the Power switch until the message appears asking if you want to erase data completely.

Step 4

Release the Power switch.

Step 5

Tap on the YES button and then tap on the OK button.

LaserWriter 16/600 PS: Setting the Paper Tray (4/97)

Revised: 4/14/97
Security: Everyone

LaserWriter 16/600 PS: Setting the Paper Tray (4/97)

=====

Article Created: 9 March 1995
Article Reviewed/Updated: 14 April 1997

TOPIC -----

I am having multiple problems with LaserWriter 16/600 with 500 sheet optional trays. They do not pull from the 500 sheet tray all the time. For example, in Microsoft Word printing using the keys Command-P pulls paper from 500 sheet tray. Using the print option in the tool bar, pulls paper from multi-purpose tray. Using the File menu and choosing Print, pulls paper from the 500 sheet feeder. I have had similar problems in both Microsoft Works and Microsoft Excel. The 500 sheet feeder is installed and preferred in the Chooser.

DISCUSSION -----

This is an application problem where the vendor is using different print records when doing a "Print One" as opposed to using the pull-down Print menu.

To correct this problem, follow these steps:

Step 1

Create a SimpleText file and enter the following lines of PostScript code.

Note:

PostScript is case sensitive. The PostScript code must be entered exactly as it shown.

This is PostScript Level 1 code:

%=====

% Begin PostScript Code

%

serverdict begin 0 exitserver

```
statusdict begin 2 setdefaultpapertray end
%
% end PostScript Code
%=====
```

The following values for the number before "setdefaultpapertray" above:

0	250 Sheet Cassette
1	Multi-purpose tray
2	500 Sheet Cassette
3	Envelope tray

This is the equivalent PostScript Level 2 code:

```
%=====
% Begin PostScript Code
%
serverdict begin 0 exitserver
1 dict dup /InputAttributes 1 dict dup /Priority [2 1 0] put put setpagedevice
%
% End PostScript Code
%=====
```

This sets the paper tray priority to:

1st Priority - Cassette (500 Sheets) - designated by the "2" in the array above.
2nd Priority - Multipurpose Tray - designated by the "1" in the array above.
3rd Priority - Cassette (250 Sheets) - designated by the "0" in the array above.

You can change the paper tray priority order by changing the values in "/Priority [2 1 0]".
For example, /Priority [0 1 2] makes the 250 sheet cassette first priority, then the Multipurpose tray next, then the 500 sheet cassette.

Step 2

Save the file and quit SimpleText.

Step 3

Launch Apple LaserWriter Utility, under the Utilities menu, choose Download PostScript File.

Article Change History:
14 Apr 1997 - Added PostScript Level 2 code.

LW Select 360: Low Memory Causes 'In Use' light to Blink (3/95)

Revised: 3/9/95
Security: Everyone

LW Select 360: Low Memory Causes 'In Use' light to Blink (3/95)

Article Created: 9 March 1995

TOPIC -----

I am trying to print my Desktop using QuickDraw GX with System 7.5. The document is getting spooled to the hard disk and the LaserWriter's 'Ready/In Use' light blinks, but it never prints. If I use the LaserWriter 8.1.1 printer driver, the Desktop prints within a minute.

DISCUSSION -----

In low memory situations when using QuickDraw GX this problem may appear. In order to correct this, send the following PostScript code to the printer.

Caution:

If you choose to use the PostScript code provided in this article, you assume all risks involved in making these changes. PostScript code, if not entered correctly, can place the LaserWriter into a condition requiring service.

```
%=====
% Begin PostScript Code
%
0 serverdict begin exitserver
<< /FactoryDefaults true >> setsystemparams
systemdict begin
realtime 10000 add
{ dup realtime le { pop exit } if } loop
quit
%
% end PostScript Code
%=====
```

PowerBook File Assistant: Data Can't Be Opened (7/95)

Revised: 7/20/95
Security: Everyone

PowerBook File Assistant: Data Can't Be Opened (7/95)

=====

Article Created: 10 March 1995
Article Reviewed/Updated: 20 July 1995

TOPIC -----

When I try and run PowerBook File Assistant, I get a message that says "The file assistant data can't be opened." I used PowerBook File Assistant yesterday. What's wrong?

DISCUSSION-----

The file assistant data has become corrupted. You can either restore it if you have made backups or simply throw it away and recreate it. "File Assistant Data" can be found in the preferences folder, in the system folder.

Macintosh System 7.5 Update 1.0 ReadMe (10/95)

Revised: 3/20/96
Security: Everyone

Macintosh System 7.5 Update 1.0 ReadMe (10/95)

=====

Article Created: 13 March 1995
Article Reviewed/Updated: 16 October 1995

TOPIC -----

The following article is the ReadMe document for Macintosh System 7.5 Update 1.0.

DISCUSSION -----

What is the Macintosh System 7.5 Update 1.0?

=====

System 7.5 Update 1.0 is a set of software enhancements that improves the performance and reliability of Macintosh computers running System Software 7.5.

When installed after Macintosh System Software version 7.5, this update provides enhancements to the system software (Launcher, system extensions, and control panels), applications, and it also provides solutions for problems encountered by some Macintosh computer users.

Before you install System 7.5 Update 1.0, review the section called "What the Update Provides" later in this Read Me. It explains the problem fixes and new features for your system, the Launcher, system extensions, control panels, and applications. For information about problems that System 7.5 Update 1.0 does not fix, see the "Tips" section.

Installing System 7.5 Update 1.0 from Disks

=====

During the update, the Installer automatically determines what software your model of Macintosh needs. However, if you want to install specific items you can choose Custom Install (see step 5 below).

Step 1

..TIL17350-Macintosh_System_7-5_Update_1-0_ReadMe_10-95_(TA33428).pdf

Before you install System 7.5 Update 1.0, make sure that Macintosh System Software Version 7.5 is installed on your computer.

Step 2

Insert the "System 7.5 Update 1.0 - 1" disk.

Step 3

Double-click the Installer icon to open it.

Step 4

Read the first screen, then click OK.

Step 5

At the next screen, do one of the following:

- To allow the Installer to automatically determine what software your computer needs, check the pop-up menu to make sure that Easy Install is displayed.
- To select specific items to install, open the pop-up menu and choose Custom Install.

Step 6

Click the Install button. Follow the messages presented, inserting disks as requested.

Step 7

When you see a message that the installation was successful, click the Restart button.

Step 8

Installing the LaserWriter 8 version 8.2 printer driver removes the LaserWriter 8 Prefs file from your system. If you use the LaserWriter 8 printer driver, you need to restore your printer settings by following the instructions below:

- Open the Chooser.
- Click the LaserWriter 8 icon.
- Click the printer name.
- Click the Setup button.

Installing System 7.5 Update 1.0 Over a Network

=====

To update Macintosh computers that are connected on a network, you can create a net install folder and install over the network. Using a net install makes updating networked computers faster and simpler.

Creating a Net Install Folder

Step 1

Create a folder on the server called "System 7.5 Update Net Install".

Step 2

Insert the first disk titled "System 7.5 Update 1.0 - 1" into the floppy disk drive.

Step 3

Open the disk and drag the following items into the "System 7.5 Update Net Install" folder:

- the Installer
- the Install System Update file
- the "System 7.5 Update 1.0 - 1" disk icon

Step 4

Do the following for each of the 3 remaining installation disks:

- Insert the disk in the floppy disk drive.
- Drag the disk icon into the "System 7.5 Update Net Install" folder.

Step 5

Verify that the "System 7.5 Update Net Install" folder contains the following icons:

- Installer
- Install System Update
- System 7.5 Update 1.0 - 1 (folder)
- System 7.5 Update 1.0 - 2 (folder)
- System 7.5 Update 1.0 - 3 (folder)
- System 7.5 Update 1.0 - 4 (folder)

Step 6

Close the "System 7.5 Update Net Install" folder.

Running the Installer Over a Network

During the update, the Installer will automatically determine what software your model of Macintosh needs. However, if you want to install specific items you can choose Custom Install (see step 6 below).

To install System 7.5 Update 1.0 over a network, follow the instructions below:

Step 1

Before you install System 7.5 Update 1.0, make sure that Macintosh System Software Version 7.5 is installed on your computer.

Step 2

From the computer onto which you want to install the System 7.5 Update 1.0, log onto the server that contains the "System 7.5 Update Net Install" folder.

Step 3

Open the "System 7.5 Update Net Install" folder.

Step 4

Double-click the Installer icon to start the Installer.

Step 5

Read the first screen, then click OK.

Step 6

At the next screen, do one of the following:

- To allow the Installer to automatically determine what software your computer needs, check the pop-up menu to make sure that Easy Install is displayed.
- To select specific items to install, open the pop-up menu and choose Custom Install.

Step 7

Click the Install button.

Step 8

When you see a message that the installation was successful, click the Restart button.

Step 9

Installing the LaserWriter 8 version 8.2 printer driver removes the LaserWriter 8 Prefs file from your system. If you use the LaserWriter 8 printer driver, you need to restore your printer settings by following the instructions below:

- Open the Chooser.
- Click the LaserWriter 8 icon.
- Click the printer name.
- Click the Setup button.

WHAT THE UPDATE PROVIDES

=====

The System 7.5 Update File

=====

The update installs a file called System 7.5 Update in your System Folder. The new file provides the following enhancements to System 7.5:

Low Memory Situations

Improves system stability when memory is very low

Japanese Systems w/QuickTime 2.0

Fixes a potential crash problem when shutting down or restarting Japanese systems with QuickTime 2.0 installed

Pasting Large Data Blocks

Fixes a potential crash problem when pasting large blocks of data

Alias Opens Correct Original

No longer opens the wrong original when you select an alias on the desktop of a disk other than the startup disk.

Custom Colors In Applications

No longer interferes with custom colors that some applications use in the Open and Save dialog boxes

Keyboard Power Key

The keyboard Power key can now be used to turn the computer off. To shut down the computer, press the Power key. When the dialog box appears, you can shut down your computer, restart your computer, put it to sleep (if it supports sleep) or cancel the shutdown.

PowerBook 100 Series

These computers do not have a Power key on their built-in keyboard. However, if you attach an external keyboard, the keyboard Power key can now be used to turn the computer off. To shut down the computer, press the Power key. When the dialog box appears, you can shut down your computer, restart your computer, put it to sleep, or cancel the shutdown.

PowerBook Duo Docks

Pressing the eject button automatically launches items in the Shutdown Items folder and shuts down the computer. No dialog box appears.

PowerBook 500 Models

Improves trackpad performance

PowerBook 150

The update extends battery life by reducing power requirements during sleep mode. It also fixes a potential system freeze problem that occurs when you use the internal modem several times without restarting the computer. The PowerBook 150 Update system extension is no longer needed and is automatically removed from the Extensions folder (inside the System Folder) during installation.

Power Macintosh

Native QuickDraw speeds up operations such as scrolling, image filtering, and pattern and text drawing. The updated Serial Driver fixes a potential crash problem.

Power Macintosh

(including Macintosh computers w/the Power Macintosh upgrade card and the

Centris 660AV, Quadra 660AV, and Quadra 840AV)

Updated video software prevents scrambled video when the computer starts up.

Macintosh: Performa 630 series, PowerBook 150, Quadra 630, and LC 630

(models with internal IDE hard disks):

The update fixes a problem that prevents the internal IDE disk from appearing on the desktop. The problem occurs when the internal IDE disk is the selected startup disk, but the computer is started up from an external hard disk by holding down the Command-Shift-Option-Delete keys during startup. The MountIDE system extension is no longer needed and is automatically removed from the Extensions folder (inside the System Folder) during installation.

Macintosh Quadra 700

An Apple Desktop Bus (ADB) patch fixes a potential problem that can slow down the mouse or trackball.

Macintosh Quadra 840AV

The updated Display Manager ensures that a multi-sync monitor is set to the correct resolution when you restart the computer.

Launcher Enhancements

=====

Launcher version 2.7 supports Macintosh Drag and Drop so that it is easier to add or remove items:

To Add An Item

Open the Launcher and drag the item into the Launcher window or onto a category button. The system creates a new Launcher button for the item by placing an alias in the Launcher Items folder. The original item remains on your hard disk.

To Remove An Item

Open the Launcher, hold down the Option key and drag the button out of the Launcher.

To Move A Launcher Button Into A New Category

Hold down the Option key and drag the button to a category (grouping) button along the top of the Launcher window.

To Open A File

Drag the file's icon onto a Launcher button that represents an application program. For example, you can open a SimpleText file by dragging its icon onto the SimpleText button. If the program the button represents can open the file, the button is highlighted when you drag the file to it.

To Put A File Into A Folder

Drag the file's icon onto a Launcher button that represents a folder.

To Re-size The Currently Visible Launcher Buttons

Hold down the Command key and click inside the Launcher window. Then choose a new size from the pop-up menu.

To Open A Category Button's Folder

(located in the Launcher Items folder)
Hold down the Option key and click the grouping button.

System Extension Enhancements

File Sharing

File Sharing version 7.6.1 improves overall performance and provides new functionality. When file sharing is turned on, removable disks and CD-ROMs will automatically be shared-except for audio CDs, which will no longer be shared. You no longer have to turn off file sharing in order to eject a removable disk or CD-ROM.

Apple Guide

Apple Guide version 1.2.5 improves performance, runs native on Power Macintosh models, and is compatible with At Ease.

SCSI Manager

SCSI Manager version 4.3.1

- works with Performa 630 series, PowerBook 150, Quadra 630, and LC 630.
- fixes a potential data corruption problem on Quadra 840AV and Quadra 660AV models.
- Fixes a potential crash problem when using some external hard disks.

Speech Manager

Speech Manager version 1.3 is provided. (It was not provided on the System 7.5 upgrade disks.)

Power Macintosh Models With PowerTalk And At Ease Installed

PowerTalk Mailbox version 1.1.1 fixes a potential crash problem that occurs when you select Go To At Ease from the File menu. PowerTalk and At Ease now work together cleanly.

Update File Replaces Some Extensions

The System 7.5 Update file contains the functionality of and removes the following extensions: EM Sound Update, PowerBook 150 Update, and Mount IDE Drive.

Threads Library

The updated Threads Library (ThreadsLib) provides additional information for developers on Power Macintoshes.

Math Functions Library

The updated Math Functions Library (MathLib) boosts performance of math operations on Power Macintoshes.

Control Panel Enhancements

=====

General Controls

General Controls version 7.5.3 improves Application folder and System Folder locking and provides more specific error messages for folder locking.

Apple Menu Options

Apple Menu Options version 1.0.1 improves performance and shows non-AppleShare servers in the Recent Servers submenu.

Keyboard

Keyboard version 7.5.1, by default, does not allow a keyboard shortcut for changing keyboard layouts. To turn on the shortcut, open the Keyboard control panel and click the Command-Option-space bar checkbox to put a check in it.

WindowShade

WindowShade version 1.3.1 fixes a potential crash problem that occurs when memory is very low.

MacTCP

MacTCP version 2.0.6 provides the following enhancements:

- shortens re-transmission delays
- prevents potential out-of-memory errors
- makes configuring communications easier
- gives you more control over the choice of which server(s) to contact and the order in which they are contacted

PC Setup

Centris 610 and Quadra 610 with the 610 PC Card installed: PC Setup version 1.0.2 is provided. (It was not provided on the System 7.5 upgrade disks.)

TV Setup

Macintosh Easy Open version 1.1.1 works better with drag and drop on document converters and fixes problems with cut and paste between Macintosh and PC applications on Macintosh computers with a PC Card installed.

Application Enhancements

=====

SimpleText

SimpleText version 1.2 provides the following enhancements:

- Large documents, PICT files, and page ranges (such as, pages 2 and 3 of a 5-page document) print correctly.
- Page Up, Page Down, and scrolling work better with Portable Digital Documents (PDDs) and other documents.
- Editing features (such as Cut, Copy, the forward delete key on extended keyboards, underlining, and selected text highlighting) work correctly.
- SimpleText documents that use a system font now retain their fonts when opened on a Macintosh with a different system font.
- In the Don't Save/Save/Cancel dialog box, you can type "D" or Command-D for Don't Save.
- If you Quit with an unsaved document, choose Save in the Don't Save/Save/Cancel dialog box, then choose Cancel in the Save dialog box, SimpleText now cancels the Quit rather than quitting.
- Remote program linking (controlling SimpleText with AppleScript from another Macintosh) is enabled by default.

Find File

Find File version 1.1.1 handles restricted-access disks better.

Synchronize Folder AppleScript

The Synchronize Folders AppleScript automated task handles nested folders properly.

Share a Folder AppleScript

A new AppleScript automated task-Share a Folder (No Guest)-lets you automatically share a folder with the Guest access disabled.

Stickies

Stickies version 1.0.1 fixes a potential crash problem that occurs when Stickies launches with a "collapsed" note window.

Jigsaw Puzzle

Jigsaw Puzzle version 1.0.1 fixes sound problems caused by a third-party extension.

PowerTalk Catalogs

PowerTalk Catalogs Extension version 1.1.1 no longer displays an out-of-memory error when you open the Catalog.

PowerTalk AppleMail

PowerTalk AppleMail version 1.1.2 works better on systems with many fonts installed and defaults to "sender only" for mail replies.

PowerTalk DigiSign Utility

PowerTalk DigiSign Utility version 1.1.1 improves printing on Hewlett Packard (HP) DeskWriter C and 550-style printers.

Direct Dialup

Direct Dialup version 1.1.1 works better when dialing using a long string and won't time out while sending a large letter or a letter with a large enclosure.

LaserWriter version 8.2 Printer Driver

Enhancements

The LaserWriter version 8.2 printer driver provides the following enhancements:

- The new Setup button in the Chooser automatically looks for the selected printer, selects the appropriate PostScript Printer Definition (PPD) file, and configures the paper trays. If you wish, you can manually configure the PPDs and papers trays manually by clicking the Setup button a second time.
- The destination in the Print dialog box resets to "Printer" instead of retaining the previous print job destination. For example, if the previous destination was "Fax," the destination automatically resets to "Printer" for the next job.
- You can tab backwards through the fields in all print dialogs by pressing Shift-Tab.

Printer Set Up

Installing the LaserWriter 8 version 8.2 printer driver removes the LaserWriter 8 Prefs file from your system. After you install, you need to set up your printer. Follow the steps below:

Step 1

Open the Chooser.

Step 2

Click the LaserWriter 8 icon.

Step 3

Click the printer you want to use.

Step 4

Click the Setup button.

Tips

====

Problem with PC Setup 1.0.2

(on the Macintosh SE, Plus, Classic, Portable, and PowerBook 100 Series)
If you use the Custom Install option, do not install PC Setup on a Macintosh SE, Plus, Classic, Portable, or PowerBook 100 (models with the 68000 processor).
When installed on these models, PC Setup causes the system to crash. Easy Install will not install PC Setup on any of these models.

Apple Menu Options "Recent Documents" and Application Launch Time

"Recent Documents" tracking in Apple Menu Options monitors all files that are opened, even those opened by an application as part of its launch sequence (for example, drop-in filters used by desktop publishing packages). This can significantly slow down the launching of such applications. At present, the solutions are to disable "Recent Documents" tracking in the Apple Menu Options control panel or turn off Apple Menu Options in the Extensions Manager.

Reset Apple Menu Options

The update returns all settings in the Apple Menu Options control panel to their default values. If you have made any changes to Apple Menu Options, you will need to select them again.

Macintosh Centris/Quadra 660AV, Quadra 840AV, and Alert Sounds

If you have a Macintosh Centris/Quadra 660AV or Quadra 840AV, some system alert sounds may not play correctly with the Alert Volume turned down. To avoid the problem, keep the Alert Volume turned all the way up and adjust the Built-in system volume. (To adjust Built-In volume, open the Sound control panel and choose Volumes from the pop-up menu.)

Problem with Guides on Some Power Macintosh Models

If you have a Power Macintosh and have trouble opening the Tutorial, Macintosh Guide, Shortcuts, or other Apple Guide databases, you may have extra files that don't belong on your computer. To solve the problem, follow the steps below:

Step 1

Open the Extensions folder (inside the System Folder) and drag the PowerBook Guide Additions file to the Trash.

Step 2

Unless your computer is an AV model, drag the following items to the Trash:

- Video Guide Additions
- Video Player Guide Additions
- Speech Guide Additions

Step 3

Choose Empty Trash from the Special menu.

Step 4

Restart your computer.

MathLib Installed on Non-Power Macintosh Systems

The update installs the Math Functions Library, which is intended for Power Macintosh systems, on some non-Power Macintosh systems (in the Extensions folder). Unless you have a Power Macintosh or plan to install a Power Macintosh upgrade card, you may remove the file by dragging it to the Trash.

Setting AppleTalk to Inactive while FileSharing is on

If you set AppleTalk to Inactive, either through the Chooser or the Control Strip, while File Sharing is on, the Sharing Setup control panel will show File Sharing is on. File Sharing is actually off.

Removing PowerTalk

=====

If you wish to remove PowerTalk software from your computer, follow the steps below:

Step 1

Do the following to clean out your mailboxes:

- Save any important messages as text to your hard disk.
- Check your out box to make sure that all mail has been sent.

Step 2

Restart your computer with all extensions off by holding down the Shift key during startup.

Step 3

When the computer is ready, open the System Folder and drag the PowerTalk Data folder to the Trash.

Step 4

Open the Apple Menu Items folder (inside the System Folder) and drag the Mail and Catalogs folder to the Trash.

Step 5

Open the Control Panels folder (inside the System Folder) and drag PowerTalk Setup to the Trash.

Step 6

Open the Extensions folder (inside the System Folder) and drag the following items to the Trash:

- AppleTalk Service (the PowerTalk extension)
- Catalogs Extension (system extension)
- Mailbox Extension (system extension)
- PowerTalk Extension (system extension)
- PowerTalk Guide (Apple Guide document)
- PowerTalk Manager (system extension)

Step 7

Open the Preferences folder (inside the System Folder) and drag the following items to the Trash:

- AppleMail Letterheads (folder)
- PowerTalk Setup Preferences (PowerTalk Manager document)
- PowerTalk Startup Preferences (PowerTalk Manager document)

Step 8

Close the System Folder.

Step 9

Open the Apple Extras folder (on your hard drive) and drag the PowerTalk folder to the Trash.

Step 10

Choose Empty Trash from the Special menu.

Step 11

Restart your computer.

Network Software Installer ZM-1.5 Read Me (3/95)

Article Created: 10 March 1995
Article Reviewed/Updated: 22 March 1995

TOPIC -----

This article is the Network Software Installer (NSI) Version ZM-1.5 Read Me file.

DISCUSSION -----

PLEASE NOTE: "ZM" indicates multi-country. This disk can be used to install NSI on systems with international versions of System Software as well as U.S. System Software.

Contents:

-
- 1) Interactions with other products
 - If you are using System 6.0.8 or earlier
 - If you are using MacIPX
 - If you are using SoftWindows
 - If you are using the Apple Internet Router
 - If you are using the SNA*ps gateway
 - If you are using 3rd party ethernet cards
 - If you are using a system with a 68040 microprocessor

2) What the Network Software Installer disk includes:

-
- Release notes
 - LaserWriter Bridge version 2.0
 - AppleTalk version 58.1.5
 - Apple Built-In Ethernet driver file version 1.0.1
 - Apple Ethernet NB driver file version 1.0.1
 - Apple Ethernet LC driver file version 1.0.1
 - Apple Ethernet CS driver file version 1.0.1
 - Apple Token Ring NB driver file version 1.0.2

1) Interactions with other products:

- If you are using System 6.0.8 or earlier: This installer works on only System 7 or later Macintosh computers. The last version of the Network Software Installer to support System 6 was version 1.4.5.
- If you are using MacIPX: The new token ring driver is not compatible with MacIPX versions 1.1 and older. Contact Novell(r) Technical Support to obtain an update to newer MacIPX software which will work with this token ring driver.
- If you are using SoftWindows: SoftWindows versions 1.0 and 1.0.1 using SMB (NetBEUI) protocols over Token Ring are not 100% compatible with the AppleTalk version included on this disk. Contact Insignia Solutions regarding availability of an update to the SoftWindows software which will work with this driver.
- If you are using the Apple Internet Router: If this release of the Network Software Installer is being used in conjunction with an Apple Internet Router v.3.0 Installer, Apple Internet Router 3.0 must be installed first. This will ensure that the Router installation does not overwrite the newer AppleTalk software contained on NSI 1.5.

The LaserWriter Bridge cannot be used on a Macintosh that has any version of the Apple Internet Router software installed.

- If you are using the SNA•ps gateway: To use this release of the Network Software Installer with a SNA•ps gateway, a special custom install option is provided that installs a compatible token ring driver for the Token Ring 4/16 NB card. SNA•ps gateway is not currently supported on the TokenTalk NB or Token Ring NB/c cards. A future version of the SNA•ps gateway will not require the custom-installed driver.
- If you are using 3rd party ethernet cards: The drivers contained in the new driver files do not support 3rd party ethernet cards. A 3rd party card that has duplicated an Apple ethernet board will use the appropriate ethernet driver from the system file instead of the Apple driver in the extensions folder file. A system with a 3rd party ethernet card will continue to operate using the previously-installed driver after installing this version of the Network Software Installer. Such systems will get the benefit of all of the other updates installed by this Network Software Installer, including the ability to install and use the LaserWriter Bridge.
- If you are using a system with a 68040 microprocessor: Some programs may quit unexpectedly or cause the computer to freeze when you attempt to open them over the network. This problem, as well as others, is fixed by installing the System Update 3.0 available from Apple Software Updates libraries on commercial online services and the Internet. (For a current list of locations, search the Apple Tech Info Library by the phrase: Apple Software Updates.) This fix has also been incorporated into System 7.5.

2) What the Network Software Installer disk includes:

You can use this Network Software Installer to install the following networking products:

- LaserWriter Bridge version 2.0
- AppleTalk version 58.1.5
- Network Control Panel version 3.0.2
- EtherTalk version 2.5.7
- Apple Ethernet NB file version 1.0.1, containing drivers for all Apple NuBus ethernet cards
- Apple Ethernet LC file version 1.0.1, containing drivers for all Apple LC ethernet cards
- Apple Ethernet CS file version 1.0.1, containing drivers for all Apple Comm Slot ethernet cards
- Apple Built-In Ethernet version 1.0.1, containing drivers for all built-in ethernets
- TokenTalk version 2.5.7
- Token Ring Control Panel version 1.0.1
- Token Ring driver version 2.5.2 for the TokenTalk NB Card
- Token Ring driver version 1.0.2 for the Token Ring 4/16 NB and Token Ring NB/c Card
- A/ROSE 1.2.1, for use in some token ring configurations

Release notes:

The following section provides some more technical information on the updates provided by this installer. Many readers will not be interested in these details.

LaserWriter Bridge version 2.0

This control panel provides for activating the LocalTalk port while ethernet or token ring is in use. AppleTalk traffic can be passed from the ethernet or token ring to a LaserWriter connected to the LocalTalk port. The LaserWriter Bridge can only be used in conjunction with this version of the Network Software Installer and is not supported on System 6. The LaserWriter Bridge can only be installed from the custom installation area of the Network Software Installer. Please see the "LaserWriter Bridge User's Guide" document for more information on this program.

AppleTalk version 58.1.5

An address-mapping problem that could cause slowdowns in EtherTalk or TokenTalk networks was fixed.

The LAP Manager was fixed to avoid sending corrupted TEST and XID response

packets in certain heavy traffic situations.

A bug that passed a corrupted length indication to multi-node clients was fixed.

A VM problem that could cause hangs was fixed (this could also have occurred when Connectix Ram Doubler was active).

A LocalTalk problem on Power Macintosh computers was fixed that prevented LaserWriter Bridge from working properly.

An additional LocalTalk problem on Power Macintosh computers was fixed that caused slow performance when both LocalTalk and GeoPort were in use.

Apple Built-In Ethernet driver file version 1.0.1

This driver file contains drivers for all Apple built-in ethernet implementations and is installed in the extensions folder.

The Macintosh Quadra 840AV and 660AV, Power Macintosh 6100, 7100 and 8100 and Workgroup Server 6150, 8150 and 9150 ethernet drivers were updated to eliminate slowdowns, hangs, lost connections and data corruptions that were possible on some ethernets.

The Duo Dock II driver was updated to properly support locally-administered addresses, which are often used in DECnet environments.

A VM problem that could cause hangs was fixed (this could also have occurred when Ram Doubler was active).

The driver configuration now properly supports machines with Macintosh Processor Upgrade with PowerPC 601 Processor cards.

Changed DMA parameters for the Macintosh Quadra 610, 650, 700, 800, 900 and 950 and Macintosh Centris 610 and 650 and Workgroup Server 60 and 80 to avoid packet loss when sharing the bus with other DMA masters such as SCSI cards and codec cards.

Apple Ethernet NB driver file version 1.0.1

This driver file contains drivers for all Apple NuBus ethernet cards and is installed in the extensions folder.

A VM problem that could cause hangs was fixed (this could also have occurred when Ram Doubler was active).

Apple Ethernet LC driver file version 1.0.1

This driver file contains drivers for all Apple LC PDS ethernet cards and is installed in the extensions folder.

A VM problem that could cause hangs was fixed (this could also have occurred when Ram Doubler was active).

Apple Ethernet CS driver file version 1.0.1

This driver file contains drivers for all Apple Comm-Slot ethernet cards and is

installed in the extensions folder.

A VM problem that could cause hangs was fixed (this could also have occurred when Ram Doubler was active).

Apple Token Ring NB driver file version 1.0.2

This token ring driver file handles all Apple Token Ring cards for the NuBus -the TokenTalk NB, Token Ring 4/16 NB and Token Ring NB/c. The file is installed into the extensions folder. The new driver for the Token Ring 4/16 NB and Token Ring NB/c cards has significantly better performance and fewer problems in large source-routed environments than earlier drivers.

Version 1.0 had a problem when used with Token Ring 4/16 NB cards in 24-bit memory mode - attempting to create a resource file on a network volume would fail. Version 1.0.2 fixes this problem.

Version 1.0 uncovered a problem with the LLC implementation on NetWare servers using certain token ring cards. Version 1.0.2 provides a work-around for the problem.

This version fixes a hanging problem that could occur when a token ring cable was disconnected while the Macintosh was active on the token ring. This could have happened when either the Token Ring 4/16 NB card or the Token Ring NB/c card was in use.

This version now attempts to work-around a problem that occurs when a NetWare server using a version of APPLETLK.NLM prior to version 4.50C without a functioning ATTOKLLC.NLM installed. Lack of ATTOKLLC.NLM in such a NetWare server prevents the normal source route discovery process from working (as documented in the IBM® Token Ring Architecture Reference). NetWare servers using APPLETLK.NLM version 4.50C or later require the LLC8022.NLM for proper operation.

DOS Compatibility Card: DOS SCSI Drive Retry Error (3/95)

Revised: 5/24/95
Security: Everyone

DOS Compatibility Card: DOS SCSI Drive Retry Error (3/95)

Article Created: 13 March 1995
Article Reviewed/Updated: 30 March 1995

TOPIC -----

I have a DOS Compatibility Card and I have installed a DOS formatted SCSI hard drive on my Macintosh. When I switch to MS-DOS and attempt to read or write to the DOS SCSI drive, I frequently get "X: Drive Unavailable" errors, Drive retry errors, and general protection errors. Why do I get these problems so often?

DISCUSSION -----

To find out what is causing the problem, first turn off filesharing in the Mac OS. Restart the DOS Compatibility Card and try to access the programs you had problems with. While doing this, do not insert any floppy disks and make sure nothing in the Mac OS is accessing the hard disk. You should also run CHKDSK or SCANDISK to make sure the drive media, file allocation tables and directory structure is in proper working order. If CHKDSK and SCANDISK do not find problems, the errors you are receiving may be related to the fact that only one operating system can access the SCSI bus at one time. If you are working in DOS/Window and some Macintosh operation needs to read or write to the SCSI drive, the Mac OS has priority and forces the DOS/Windows software to wait. This can cause the errors you mentioned. If filesharing is on and someone is accessing your hard disks while a program on the DOS/Windows side is reading or writing to its SCSI drive, it is forced to wait for the Mac OS to complete its tasks. In some cases, if you insert a floppy disk while DOS/Windows is doing a read or write, the Mac OS again takes precedence and force DOS/Windows to wait, sometimes causing the errors you described. In most cases, selecting "retry" may allow the DOS/Windows program to access to the SCSI resources it is trying to read or write to. However, DOS/Windows still has to wait for the Mac OS to finish using the SCSI bus.

If you have a problem starting up windows or you are getting errors with the windows swap file (sometimes its OK and Windows just thinks it's corrupted), examine the same items discussed above. Remember, the MacOS has priority over the SCSI Bus and if Windows is trying to startup using its files while a Mac OS

application is reading or writing, Windows is forced to wait causing an error.

Macintosh 630 family: Low Audio Level When Recording (9/95)

=====

Article Created: 30 March 1995
Article Reviewed/Updated: 7 September 1995

TOPIC -----

After using the Sound control panel or various third-party applications to record 8-bit sound into my Macintosh 630 family computer, I notice a lower audio level and some hiss when played back.

When I record with the TV/Tuner Card, the sound is normal. What is causing this and what can I do to get higher quality recordings?

DISCUSSION -----

Lower quality recording of sounds is normal when recorded as you describe because the Macintosh 630 series computers record sound at 8-bit, 22khz. However, since you can play back audio at 16-bit, noise not audible at 8-bit will become audible at 16-bit.

To record higher quality audio tracks, use the QuickTime Movie Import component to open audio CD tracks from QuickTime's Standard File Preview dialog.

If you have an AppleCD 300 or 300i drive, you can use QuickTime 1.6, or later, to convert tracks from audio compact discs directly into QuickTime movies.

The Tech Info Library article titled "QuickTime 1.6: Saving Sound in a QuickTime Movie", provides additional information on recording sound at higher quality levels.

The following computers are in the Macintosh 630 family: Performa 630, Performa 635, Performa 636, Performa 637, Performa 638, Performa 640, LC 630, and Quadra 630.

MS-DOS/Windows: Downloading Executable Macintosh Files (11/95)

Revised: 11/27/95
Security: Everyone

MS-DOS/Windows: Downloading Executable Macintosh Files (11/95)

Article Created: 15 March 1995
Article Reviewed/Updated: 22 November 1995

TOPIC -----

I downloaded two Macintosh SEA (Self-Extracting Archive) files to my Windows computer, then transferred the files to my Macintosh through our local area network. Now when I try to double-click the files, they do not work. Why?

DISCUSSION -----

Macintosh files consists of two parts -- a resource fork and a data fork. When you download files on a MS-DOS computer, you loose resource fork since MS-DOS/Windows only understands how to handle the data portion of the file. However since Macintosh files are upload using the MacBinary file format, you can occasionally fix the file (this does not always work).

The MacBinary format places a 128 byte header on the uploaded file. This header, if not removed from the file, makes the file unusable on the Macintosh. There are some public domain and commercial application programs for the Macintosh that can remove the 128 byte MacBinary header to make the file usable again. Sometimes after transferring the file from one platform the file is corrupted and there is nothing you can do to fix the file other than download the file again using a Macintosh computer.

Article Change History:
22 Nov 1995 - Corrected the byte count.

Apple MessagePad 110/120: Battery Recharging Explanation (5/95)

Revised: 10/13/95
Security: Everyone

Apple MessagePad 110/120: Battery Recharging Explanation (5/95)

Article Created: 15 March 1995
Article Reviewed/Updated: 3 May 1995

TOPIC -----

Is there a difference between the way the Rechargeable Battery Packs are recharged in the Apple MessagePad 110 and Apple MessagePad 120 while connected to the AC Power Supply verses being left in the MessagePad Charging Station? Also, is there a difference between the two previous methods and putting the battery packs into the charging station?

DISCUSSION -----

The Rechargeable Battery Packs charge in the same manner whether they are recharged in the Apple MessagePad 110 or Apple MessagePad 120 connected to the AC Power Supply, left in the MessagePad Charging Station, or if the battery packs themselves are put into the Charging Station.

The Charging Station, MessagePad 110, and MessagePad 120 have a smart charging circuitry that limits the damage of the fast charge cycle so the battery can last a long time. This means that if the batteries are recharged using either method, this circuitry is protecting the batteries. This lets you place batteries back on the recharger with more than a 50% charge without affecting the overall battery life.

The manual states that the Rechargeable Battery Pack should be 50% discharged before a recharge. While this is still important, the statement is misleading. The charging technology used in the current circuitry lets you charge the batteries at any time. Current information on NiCad and recharging technology, memory effect, and life problems of NiCad batteries, is the basis for this statement.

Memory Effect

NiCad rechargeable batteries suffer from an effect commonly called "memory", where if the battery is partially discharged, then recharged, it reaches a point

where the perceived capacity of the battery is that level to which it has been draining to. If the battery is fully drained periodically, this effect can be minimized or eliminated.

Batteries Used In Apple MessagePad

The batteries used with the Apple MessagePad 110 and MessagePad 120 are of a higher quality than commercial NiCad batteries you can purchase. Quality is measured with a "C" value. The "C" refers to the amount of time and current a battery needs for a "fast charge." The more times a battery has to go through the fast charge, the shorter its life before it needs replacing. The batteries used for the original MessagePad and MessagePad 100 were a C10, and the new batteries are a C20. The batteries used in the MessagePad 110 and MessagePad 120 can sustain a faster "fast" charge than the older batteries. This lets the new batteries charge faster even under a trickle charge.

The Charging Station and MessagePad 110/120 will trickle charge, or adjust the amount it charges, as the battery comes close to full. Most commercial NiCad batteries last 9-12 months if you recharge them when they still have 50% or more charge. The MessagePad 110/120 batteries typically last 12-16 months. These batteries last longer if you recharge them with 50% or more life left. This is because the Charging Station and the MessagePad 110/120 do a full fast charge once the batteries are over 50% full, which prolongs their life. In addition, you can get additional battery life by occasionally letting the batteries drain all the way, then recharging them.

Apple Guide 1.2.5: Older Guide Files Issue (10/95)

=====

Article Created: 15 March 1995
Article Reviewed/Updated: 5 October 1995

TOPIC -----

After installing System 7.5 Update 1.0 onto my Power Macintosh, I cannot open any of my Apple Guide files. What can I do to use Apple Guide?

DISCUSSION -----

If you have a Power Macintosh and have trouble opening the Tutorial, Macintosh Guide, Shortcuts, or other Apple Guide databases, you may have extra files that do not belong on your computer. To solve the problem, follow the steps below:

1. Open the Extensions folder (inside the System Folder) and drag the PowerBook Guide Additions file to the Trash
2. Unless your computer is an AV model*, drag the following items to the Trash:
 - Video Guide Additions
 - Video Player Guide Additions
 - Speech Guide Additions
3. Choose Empty Trash from the Special menu
4. Restart your computer

* If you have a Power Macintosh 6100 AV, 7100 AV, or 8100 AV, you should remove these files. Even though it may work, Video Player is not supported on these computers.

What has happened is that an older guide file has been found by the new version of Apple Guide and it will not load the database. Removal of the above mentioned files will resolve the issue.

AppleScan: Does Not Print In Grayscale (3/95)

=====

Article Created: 15 March 1995

TOPIC -----

Will the AppleScan software allow me to print grayscale?

DISCUSSION -----

The AppleScan software will not print greyscale images, since it was not designed to offer this option. AppleScan gives you the ability to scan grayscale images, which can be used in other application programs that support grayscale printing.

It is possible to scan different images as "line art" or "halftones" and then print them directly from AppleScan. However, when images are scanned as "grayscale" there is no option for printing them from AppleScan.

Fat Binary: What Is It? (7/95)

Revised: 7/19/95
Security: Everyone

Fat Binary: What Is It? (7/95)

=====

Article Created: 15 March 1995
Article Reviewed/Updated: 19 July 1995

TOPIC -----

What exactly is a fat binary in relation to a particular software application?

DISCUSSION -----

A fat binary is any executable file, such as an application or code resource, that contains both 680x0 and PowerPC code. Creating a fat binary requires a little more work for the software developer, but the reward is optimal code performance in either environment.

A fat application contains PowerPC code in its data fork and a 680x0 version of the same code in its resource fork. You can run a fat application on both types of Macintosh computers.

Remember that PowerPC code is stored in the data fork of the application file by default when you build a PowerPC application. This makes building fat applications possible.

Apple Shared Library Manager and Shared Libraries (7/95)

Revised: 7/6/95
Security: Everyone

Apple Shared Library Manager and Shared Libraries (7/95)

=====

Article Created: 15 March 1995
Article Reviewed/Updated: 06 July 1995

TOPIC -----

This article describes the Apple Shared Library Manager (ASLM) and shared libraries.

DISCUSSION -----

Apple Shared Library Manager is a piece of code that lets other programs share common code. Historically each application was required to link in any necessary library modules at compile time. The shared library manager lets any common code be loaded into memory only once by all running applications and then shared by others who also need to make the same calls thus reducing the memory foot print for application.

ASLM ships with several Apple as well as some third-party products. Any application that requires ASLM ships with a copy of the application. ASLM maintains the relationship of applications to shared libraries at the system level.

Shared Libraries

A shared library is a library of functions or classes (for C++ programmers) that are compiled, linked, and stored separately from the clients (applications) that use them. By accessing the functions or classes that are stored in a shared library, a client (application) can call functions that are not part of its executable code. Furthermore, functions or classes that are stored in a shared library can be called by different applications that are running at the same time.

Because shared libraries can contain shared code and are loaded and linked at run time, they save enormous amounts of RAM and disk space. Shared libraries eliminate the necessity for keeping multiple copies of code in memory when multiple applications use the same code. Shared libraries help software

developers design independent, modular, compact libraries that applications can share. It also helps software designers develop their products faster, and it makes the products easier to improve and maintain.

A shared library file is a binary file that can contain object code for functions, classes, methods (member functions), data, and resources. A shared library file can contain one or more shared libraries. When a shared library file is made available, developers can share, and dynamically link with, the code stored in the shared library.

Clients

A client is any application or library that creates objects or uses methods or functions that are implemented in shared libraries. Clients can include applications, system extensions, INITs, CDEVs, XFCNs, and XCMDs, other kinds of stand-alone code resources, and even shared libraries themselves, because shared libraries typically use other shared libraries.

A client written in a non-object-oriented language, such as C or Pascal, can call routines that are stored in a shared library in the same way that it would call any other function. A C++ client can instantiate objects from classes that are stored in the shared library in the same way that it would instantiate objects from any class.

Apple LocalTalk Bridge: Description (7/95)

Revised: 7/7/95
Security: Everyone

Apple LocalTalk Bridge: Description (7/95)

=====

Article Created: 15 March 1995
Article Reviewed/Updated: 07 Jul 1995

TOPIC -----

This article describes the Apple LocalTalk Bridge.

DISCUSSION -----

The Apple LocalTalk Bridge lets you extend the networking reach of your current Macintosh system, whether you are running an Ethernet network or a Token Ring only network. By effectively uniting two different networks, the Apple LocalTalk Bridge provides an inexpensive software solution that creates a single virtual network -- eliminating the need to install a router or repeatedly switch network connections.

The Apple LocalTalk Bridge is a control panel that bridges a LocalTalk network to another network selected from the Network control panel. This simple and effective solution lets you upgrade some, or all, of your Macintosh computers to a higher-speed network (for example, Ethernet or Token Ring) while maintaining the ability to print to LocalTalk-only LaserWriter printers or share files with PowerBook computers that lack high-speed network capabilities. Similarly, if you have an Ethernet or Token Ring only network, the LocalTalk Bridge provides a convenient way for your LocalTalk-only PowerBook computer or Newton MessagePad communications device to gain access to network services.

Designed with the end user in mind, the LocalTalk Bridge features dynamic, user-selectable access modes. When access is set to Private, the LocalTalk devices and services--such as LaserWriter printers and shared Macintosh volumes--are hidden from users on the Ethernet or Token Ring network, while LocalTalk-only devices retain full access to the services on both sides of the network. In contrast, when access is set to Public, all devices are visible from both sides of the network.

Used in conjunction with the Apple Ethernet 10T/5 Hub and the appropriate media adapters, network cards, or connectors, the Apple LocalTalk Bridge can provide a

..TIL17366-Apple_LocalTalk_Bridge-Description_7-95.pdf

complete upgrade to an integrated Ethernet or Token Ring and LocalTalk network without the high degree of cost and complexity normally associated with bridging or routing different networks. So if you want to upgrade or simply extend the network access of your current system—but do not want to spend a lot of time and money in the process—the Apple LocalTalk Bridge is the answer.

Features

=====

Ease of use

- Offers easy installation
- Configures simply; just run the installation program and restart the computer
- Eliminates the need to switch network connections whenever you want to print
- Eliminates the need to set network numbers

Flexibility

- Preserves your investment in LocalTalk printers and computers
- Makes it easy to upgrade your LocalTalk network to Ethernet or Token Ring
- Enables users to connect to and use LocalTalk-only devices on an Ethernet or Token Ring network such as:
 - Some LaserWriter printers
 - ImageWriter II and Color StyleWriter 2400 with their respective LocalTalk options installed
 - PowerBook notebook computers
 - Newton MessagePad communications devices
- Lets you access file servers, email, host-based systems, and databases on an Ethernet or Token Ring network while maintaining a seamless connection to your LocalTalk network
- Supports multiple LocalTalk devices, up to 32 per bridged twisted-pair segment, however 20 are recommended when the bridge is also being used as a workstation

Compatibility

- Works with all Macintosh computers running System 7 or later software that are equipped with a LocalTalk connection and one other network (Ethernet, Token Ring, or Infrared) connection
- Is compatible with Apple Internet Router 3.0.1 networks, Apple Remote Access, MacTCP, and the Apple IP Gateway

Security

- Features a "Private" mode that allows users to determine whether to allow

non-LocalTalk users access to their LocalTalk segments

Convenience

- Offers dynamic On/Off capabilities that allow users to maintain separate networks without having to restart
- Makes it easy to create, expand, administer, and troubleshoot your network
- Provides affordable plug-and-play LocalTalk to Ethernet or Token Ring network connection

Apple LocalTalk Bridge: Specifications (3/95)

=====

Article Created: 15 March 1995

TOPIC -----

This article describes the specifications and order information for the Apple LocalTalk Bridge.

DISCUSSION -----

Technical Specifications
=====

Network types supported

Supports any AppleTalk network, including:

- LocalTalk
- Ethernet
- Token Ring
- Infrared

Resulting bridged networks

- LocalTalk to Ethernet
- LocalTalk to Token Ring
- LocalTalk to Infrared

Security options

- Public mode
 - Allows all users on both sides of the network to see all devices
- Private mode
 - Allows users on the LocalTalk side to connect to all services and printers
 - Allows the Macintosh functioning as the bridge to connect to all services and use all printers
 - Can prevent users on the Ethernet/Token Ring network from connecting to or

printing on devices on the LocalTalk/Infrared side of the network

Specifications

- Dynamic On/Off switch
- Supports multiple LocalTalk devices (up to 32)
- Control panel device

Compatibility

- Apple Internet Router 3.0.1
- Apple Remote Access 2.0 family of products
- AppleShare Client for Windows
- MacTCP

System requirements

- A Macintosh or Workgroup Server running Mac OS version 7.0 or later
- At least 70K of RAM
- An available LocalTalk port
- A LocalTalk connector and cable
- An Ethernet connection or Token Ring connection
- Appropriate network cables

MAE 2.0: Has Modified Macintosh Network Resources (3/95)

Revised: 3/22/95
Security: Everyone

MAE 2.0: Has Modified Macintosh Network Resources (3/95)

Article Created: 16 March 1995
Article Reviewed/Updated: 22 March 1995

TOPIC -----

This article describes the presence of several modified Macintosh extensions and control panels used in AppleTalk for Macintosh Application Environment (MAE).

DISCUSSION -----

AppleTalk for MAE 2.0 relies on the presence of several modified Macintosh extensions and control panels to provide AppleTalk network services. These extensions and control panels, shown below, are different from those of Mac OS system releases and should not be replaced, modified, or upgraded. If these files are corrupted, they can be recreated by removing the System Folder and restarting MAE.

AppleTalk System Resources

- AppleShare: A Chooser extension that lets clients access to AppleShare File Servers.
- LaserWriter 8: A Chooser extension that enables Printing to AppleTalk Laser Printers.
- File Sharing Extension: An extension that implements System 7 Personal File Sharing.
- EtherNet Phase 2: A network extension that implements AppleTalk over an Ethernet data link.
- Network Extension: An extension that implements additional AppleTalk drivers.
- Sharing Setup control panel: Lets the user set owner name, password, and Machine Name, and to disable or enable Program Linking and File Sharing.

- File Sharing Monitor control panel: Monitors the use of File Share volumes by remote users.
- Users & Groups control panel: Lets the Macintosh owner create users and groups to control access to File Share volumes.
- Network control panel: Lets the Macintosh user set the zone and select an AppleTalk interface.

MAE 2.0: AppleTalk Protocols Implemented (3/95)

Revised: 3/15/95
Security: Everyone

MAE 2.0: AppleTalk Protocols Implemented (3/95)

Article Created: 16 March 1995

TOPIC -----

This article describes the AppleTalk protocols implemented in Macintosh Application Environment (MAE).

DISCUSSION -----

AppleTalk, a network system designed and developed by Apple Computer, provides an easy way to share network resources such as printers, file servers, and groupware services.

AppleTalk for MAE is an implementation of the AppleTalk version 56 protocol specification, based on streams, which makes AppleTalk functionality available to Macintosh applications and system software running under MAE. It is compatible with other versions of AppleTalk Phase 2.

Implementation

AppleTalk for MAE maintains the Macintosh Toolbox Application Programming Interface to AppleTalk routines, as described in "Inside Macintosh: Networking."

AppleTalk consists of a number of protocols that correspond roughly to the layers of the OSI model. AppleTalk for MAE uses streams to configure the following AppleTalk protocols into the UNIX kernel:

- AppleTalk Address Resolution Protocol (AARP)
- AppleTalk Data Stream Protocol (ADSP)
- AppleTalk Echo Protocol (AEP)
- AppleTalk Transaction Protocol (ATP)
- Datagram Delivery Protocol (DDP)
- EtherTalk Link Access Protocol (ELAP)
- Name Binding Protocol (NBP)
- Routing Table Maintenance Protocol (RTMP)

- Zone Information Protocol (ZIP)

The remaining protocols are implemented as Macintosh-style drivers and extensions:

- AppleTalk Filing Protocol (AFP)
- AppleTalk Session Protocol (ASP)
- Printer Access Protocol (PAP)

AppleTalk for MAE implements the version 56 specification of AppleTalk, which does NOT include support for some extensions found in later versions, such as:

- Apple Open Collaboration Environment (AOCE)
- AppleTalk Remote Access
- AppleTalk SNMP MIB

AppleTalk for MAE maintains compatibility with all versions of AppleTalk that conform to the AppleTalk Phase 2 specification (see "Inside AppleTalk, Second Edition"). Workstations using AppleTalk for MAE can interact with any device that uses AppleTalk Phase 2.

AppleTalk for MAE does not support the use of AppleTalk outside of the Macintosh Application Environment. There is no API available to UNIX processes for accessing AppleTalk services. Applications that rely on the availability of both Macintosh and UNIX APIs, such as AppleShare Pro, will not run on MAE.

AppleTalk for MAE cannot be used if a third-party AppleTalk stack is installed on the host workstation, and AppleTalk services will not be available to MAE running on a machine that does not have AppleTalk kernel modules for MAE installed.

AppleTalk For MAE 2.0: Troubleshooting (5/95)

Revised: 5/19/95
Security: Everyone

AppleTalk For MAE 2.0: Troubleshooting (5/95)

Article Created: 16 March 1995
Article Review/Update: 18 May 1995

TOPIC -----

This article provides help for common problems with AppleTalk for Macintosh Application Environment (MAE).

DISCUSSION -----

No AppleTalk Zone list in the Chooser

If the Chooser does not display a list of zones when MAE is used on a network with multiple zones, then the AppleTalk kernel stack is not communicating properly with the router. Please check your router configuration and network interface.

No Personal File Sharing

Many networks with only UNIX workstations will be routing IP. If you cannot see another MAE application or Macintosh doing Personal File Sharing on the network, try using the "appleping" utility to make sure AppleTalk is getting through.

Using network diagnostic tools

Standard AppleTalk diagnostic tools can be used to investigate the behavior of AppleTalk for MAE. However, most Macintosh-based tools that diagnose low-level hardware drivers cannot be run on MAE itself.

Reinstalling AppleTalk for MAE

If an AppleTalk streams module is corrupted or deleted, it is safest to shut down all MAE processes that may be executing and then reinstall the AppleTalk Kernel Module package with the MAE Installer.

Restoring network extensions

Do not replace the network extensions that ship with MAE. These extensions are specially tailored for the MAE environment. If these extensions are removed, corrupted, or altered, you can restore them by removing the current System Folder and restarting MAE. This will cause the entire System Folder to be recreated.

Other extensions, such as Chooser extensions, may be added without conflict.

An AppleTalk router comes up

If you are administering an MAE server and you change the network topology while the AppleTalk kernel stack is active, one of the following messages may appear:

An AppleTalk Router just came up.
This Node's address is in startup range.
Shutdown or Restart MAE to use full AppleTalk functionality.

or:

An AppleTalk Router just came up.
This Node's address is invalid for this cable.
Shutdown or Restart MAE to use full AppleTalk functionality.

Quit all active MAE sessions, ensuring that the kernel stack is inactive (run `appletalk -D` and `appletalk -s`), and then restarting the sessions.

Booting HP-UX from the saved kernel

When you install MAE onto a Hewlett Packard (HP) workstation, MAE alters the kernel and saves the old HP-UX kernel in a file called `hp-ux.save`. If you need to reboot from the old kernel (for example, if the altered HP-UX kernel has become corrupted), you may do so either by copying `/hp-ux.save` to `/hp-ux`, and then rebooting, or rebooting from the `/hp-ux.save` kernel.

To reboot from the `/hp-ux.save` kernel, follow these instructions:

Step 1

Shut down the workstation.

Step 2

Restart the workstation. When the power goes on, the console displays a message similar to the following:

"Search for potential boot devices."

To terminate search, press and hold the ESCAPE key.

Step 3

Press and hold the (Esc) key until you see the following message:

"Selection process stopped."

"Searching for potential boot devices."

After a moment, the console displays a list of SCSI device options from which to boot.

Step 4

Choose the appropriate boot device. For example, if SCSI device 6 is the appropriate option, enter the following:

"b scsi.6.0 ipl"

This will cause an ISL prompt (ISL>) to be displayed.

Step 5

At the ISL prompt, enter the following:

"hpux boot disc(;0)/hp-ux.save"

This will result in booting the alternate kernel in /hp-ux.save.

MAE 2.0: Product Description (3/95)

Revised: 3/15/95
Security: Everyone

MAE 2.0: Product Description (3/95)

=====

Article Created: 16 March 1995

TOPIC -----

This article is a description of Macintosh Application Environment (MAE) version 2.0.

DISCUSSION -----

Macintosh Application Environment (MAE) -- the virtual Macintosh for open systems -- is an innovative software product that provides a complete Macintosh environment in an X Window, allowing you to run Macintosh 680x0 applications right on your workstation.

MAE brings the functionality and ease of use of the Macintosh computer to Sun Microsystems SPARCstations running the SunSoft Solaris operating system, as well as to Hewlett Packard (HP) Series 700 workstations running HP-UX.

Version 2.0 extends the power of MAE with the inclusion of AppleTalk networking, making it easy to share printers, files, and email with other Macintosh and MAE users on a network. Other new features include support for MacTCP, dramatic performance gains, support for Macintosh sound-based applications, and much more.

Since MAE is based on Macintosh System 7.1 (and includes several handy features of Macintosh System 7.5), you can run the most popular off-the-shelf Macintosh software -- including popular spreadsheet, desktop publishing, word processing, graphics, email, calendar, and business applications -- on your workstation.

MAE also seamlessly integrates with the UNIX environment, allowing you to copy and paste text and graphics between UNIX and Macintosh applications. MAE lets you open UNIX files (including NFS-mounted volumes), access UNIX applications through the Macintosh interface, and use system services (such as UNIX PostScript printers). And support for MacTCP allows access to the Internet and TCP/IP-based applications.

Features

=====

It's a virtual Macintosh

- Supplies the Macintosh graphical user interface and desktop manager in an X Window
- Provides the Macintosh System 7.1 environment
- NEW! Offers several features of Macintosh System 7.5
- Allows you to cut and paste data between Macintosh applications
- NEW! Lets you resize the Macintosh X Window to any size -- without restarting MAE

It runs Macintosh applications

- Lets you run off-the-shelf Macintosh software applications
- NEW! Offers Dynamic Recompilation for performance gains of more than 50%
- NEW! Supports Macintosh sound-based applications
- NEW! Includes QuickTime Player and HyperCard Player software

Integrates smoothly with UNIX

- Provides an easy-to-use Macintosh interface to navigate local and NFS-mounted UNIX files
- Allows access to UNIX resources and services from within the MAE X Window
- Lets you copy and paste text and graphics between the UNIX and Macintosh environments
- Prints UNIX and Macintosh files on printers that support PostScript using the Apple Chooser and the Print command

It makes networking easy

- NEW! Makes MAE-to-Macintosh networking easy with built-in support for AppleTalk
- Lets you share documents, email, and printers with Macintosh users and other users of MAE
- NEW! MacTCP support allows access to the Internet and TCP/IP-based applications
- Takes advantage of NFS (Network File System), allowing file sharing and file

services across the network

- Displays and allows manipulation of remote as well as local Macintosh and UNIX files and applications
- NEW! Offers better support for remote file access under NFS

MAE 2.0: Personal File Sharing and root Directory (3/95)

Revised: 3/15/95
Security: Everyone

MAE 2.0: Personal File Sharing and root Directory (3/95)

=====

Article Created: 16 March 1995

TOPIC -----

This article provides a description of personal file sharing in Macintosh Application Environment (MAE) and an important notice about not sharing the root directory.

DISCUSSION -----

The File Sharing extension included with MAE allows any MAE workstation with AppleTalk active to act as a personal file sharing server. Macintosh personal file sharing is an AppleTalk-based network file system that is separate and distinct from other network file systems, such as NFS. However, MAE's integration of UNIX file systems into the Macintosh Finder enables users to share both UNIX and HFS volumes and folders from their MAE workstations. These directories can be mounted by authorized AppleShare clients on the AppleTalk network.

IMPORTANT: In most cases, a user should NOT share the root directory without careful configuration of access privileges. For example, sharing the root directory with read only permission allows remote users to view files such as /etc/passwd. Users should be especially cautious when sharing folders on NFS volumes via file sharing.

MAE 2.0: Running Several MAE Sessions Simultaneously (3/95)

Revised: 3/15/95
Security: Everyone

MAE 2.0: Running Several MAE Sessions Simultaneously (3/95)

=====

Article Created: 16 March 1995

TOPIC -----

This article provides information on running several Macintosh Application Environment (MAE) sessions simultaneously on a workstation.

DISCUSSION -----

Users can run several MAE sessions simultaneously on a workstation. The first MAE session constructs an AppleTalk kernel stack that remains active until the final MAE session is shut down. Each session appears to the user as an independent Macintosh.

The sessions share the AppleTalk kernel stack and consequently have the same AppleTalk address and the same set of AppleTalk DDP sockets. These DDP (Datagram Delivery Protocol) sockets are allocated on a first-come first-serve basis from a pool of 125 sockets.

Since the AppleTalk zone and network interface are associated with the AppleTalk kernel stack, they cannot differ among concurrent MAE sessions. Also, a user cannot change the AppleTalk zone and network interface while another MAE session running AppleTalk is active.

When a single MAE session is active, you can use the Network control panel to select an AppleTalk zone and a network interface. However, you cannot change the Network control panel when several MAE AppleTalk sessions are running concurrently. You should set the zone and network interface before making the node available to several concurrent users.

MAE 2.0: Product Specifications (5/96)

Revised: 5/13/96
Security: Everyone

MAE 2.0: Product Specifications (5/96)

Article Created: 16 March 1995
Article Reviewed/Updated: 13 May 1996

TOPIC -----

This article provides the Macintosh Application Environment (MAE) version 2.0 product specifications.

DISCUSSION -----

Specifications
=====

Macintosh desktop manager

- Includes complete Macintosh Finder and desktop manager
- Graphically depicts files as icons, including non-Macintosh documents and applications
- Lets you point and click to copy, move, or open files, or to launch applications

Macintosh Finder

- Organizes files and applications in an easy-to-use folder hierarchy
- Provides a Macintosh consistent interface for all Macintosh applications

Macintosh toolbox

- Includes QuickDraw to manage all graphics operations required by Macintosh applications
- Allows you to share data that is going to be updated dynamically using publish-and-subscribe capabilities

- Includes the Toolbox Event Manager to translate the X Window System user keyboard and mouse input
- Includes routines that enable QuickDraw to interoperate with the X Window System

Macintosh system services

- Allows you to manipulate UNIX files using Macintosh operations (moving, copying, deleting, and so on)
- Supports printing on system printers such as PostScript printers on UNIX networks
- Takes advantage of NFS to allow file sharing and file services across the network
- Simplifies MAE-to-Macintosh networking with built-in AppleTalk support
- Supports MacTCP for access to the Internet and TCP/IP-based applications
- Includes the Cursor Manager, which keeps the Macintosh cursor within the MAE window so you can focus on Macintosh tasks

Mixed-mode manager

- Enables faster performance by directly accessing the native RISC processor for certain routines, using the inherent power and speed of the host operating system

Macintosh 68040LC emulator

- Provides high-speed emulation of 68040 code
- Delivers optimum compatibility with the Macintosh architecture

Industry-standard compliance

- Complies with X Window System version 11, release 4 and 5
- Operates under Motif, HP VUE, and OPEN LOOK

Hardware and software requirements

- HP Series 700 workstation running HP-UX 9.0x or HP-UX 10.01
NOTE: As of April 1996, HP-UX 10.1 is not supported with MAE 2.0.2.
- Sun SPARCstation running Solaris 2.3, 2.4 and 2.5
- X Window System version 11, release 4 or 5
- Window manager such as Motif, HP VUE, or OPEN LOOK

- Memory: 16MB minimum; 32MB recommended
- Hard disk space: 16MB minimum; 22MB recommended
- MAE includes STREAMS/UX to enable AppleTalk connectivity on HP Series 700 workstations running HP-UX

NOTE: HP-UX 10.0.1 does not require STREAMS

Ordering Information

=====

To order MAE, or to upgrade from version 1.0 to version 2.0, call 1-800-293-6617, ext. 940 (in the United States), or contact your local reseller.

- MAE for Solaris, Version 2.0 (1 user)

Order No. M2191Z/B

- MAE for HP-UX, Version 2.0 (1 user)

Order No. M3128Z/B

Also available are 20- and 50-user packages and volume licenses. Please contact your local Apple reseller or representative for pricing and other information.

Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

MAE 2.0: AppleTalk Access Privileges (3/95)

Revised: 3/15/95
Security: Everyone

MAE 2.0: AppleTalk Access Privileges (3/95)

=====

Article Created: 16 March 1995

TOPIC -----

This article describes AppleTalk access privileges and UNIX permissions when sharing files (directories) under Macintosh Application Environment (MAE) 2.0.

DISCUSSION -----

When you share a folder or a disk, by default anyone on the network can open it, read it, or change it. However, you can set access privileges to files and folders you own (that is, those that you have created or whose ownership has been transferred to you) to specify who can use your shared items. You can also allow access to guest users; see "Naming Specific Users," later in this section.

There are three types of FileShare access privileges:

- See Folders: You can open the folder.
- See Files: You can open any file within the folder.
- Make Changes: You can change the contents of any file within the folder.

IMPORTANT: When MAE users export part of a UNIX file system via file sharing, they can grant FileShare access only to the extent that the UNIX permissions allow them that access. For example, if an MAE user does not have write access to a file, the user cannot export that file with FileShare write access. Thus, the privileges another user has when accessing files are the most restrictive combination of the UNIX permissions and the file sharing privileges.

Differences between UNIX and Macintosh access permissions

The differences between UNIX permissions and Macintosh file-sharing privileges can be summarized as follows:

- Macintosh file-sharing privileges affect file sharing over AppleTalk. UNIX permissions affect permissions across all UNIX networks.
- All files and folders (directories) created within UNIX are assigned default UNIX permissions automatically. Folders and their contents are assigned Macintosh file-sharing permissions only if the owner of the folder has made the folder available to others.
- UNIX permits the owner to assign different permissions to every item within a directory; Macintosh file sharing allows the owner to set privileges for the folder. These privileges are transferred to all the contents of the folder collectively.
- In most cases, a user should not share the root directory without careful configuration of access privileges. For example, sharing the root directory with read-only permission allows remote users to view files such as /etc/passwd. Users should be especially cautious when sharing folders on NFS volumes via file sharing.

The following table shows UNIX permissions compared with file sharing privileges:

If UNIX permissions are			Then file sharing privileges are	
Read	Write	Execute	See Folders and See Files	Make Changes
No	No	No	No	No
No	No	Yes	No	No
No	Yes	No	No	Yes
No	Yes	Yes	No	Yes
Yes	No	No	No	No
Yes	No	Yes	Yes	No
Yes	Yes	No	No	Yes
Yes	Yes	Yes	Yes	Yes

MAE 2.0: Release Notes and Read Me, Part 1 of 2 (3/95)

Revised: 3/15/95
Security: Everyone

MAE 2.0: Release Notes and Read Me, Part 1 of 2 (3/95)

Article Created: 16 March 1995

TOPIC -----

This article is part 1 of 2 of the README.TXT file for Macintosh Application Environment (MAE) version 2.0. This Read Me document should be read before installing or using MAE 2.0.

DISCUSSION -----

About This Document

=====

READ THIS DOCUMENT BEFORE INSTALLING OR USING MAE 2.0! It is a road map to the other MAE documentation and the MAE installation process. It is the only source for some information, including last-minute tips, and cautions relating to the software and the documentation. You may want to keep a printed copy of this document; it is designed to be printed directly by lp or lpr at 66 lines per page.

Supported Workstations And Operating Systems

=====

This release of MAE is compatible with Sun workstations running Solaris 2.3 and later, and with Hewlett Packard (HP) workstations running HP-UX 9.0x. Ross HyperSPARC processors are also supported. Recommended RAM is 32MB or more; configurations smaller than 16MB are not supported. This version has not been tested with HP series 800 machines.

What's New In MAE 2.0

=====

- FULLY SUPPORTED APPLETALK NETWORKING: You can use the Chooser desk accessory to access other machines running MAE as well as Macintoshes. You can use

AppleTalk printers, share files with other users, and run popular AppleTalk applications such as mail, scheduling and database group-ware. See Chapter 7 of the MAE USER'S GUIDE, "Networking with MAE."

- PERFORMANCE ENGINEERING: Sophisticated software techniques substantially improve the performance of most applications under MAE 2.0.
- MACINTOSH SOUND OUTPUT SUPPORT: Most applications that produce sound work with MAE 2.0. See Appendix B of the MAE USER'S GUIDE, "Using Sound."
- AFS AND NFS FILE SYSTEM SUPPORT: Significantly enhanced network file system support; performance is improved for all file system types.
- DYNAMIC RESIZE: Resizing the MAE desktop does not require restarting MAE.
- IMPROVED APPLICATION INSTALLATION: A "Temporary Installer Volume" (TIV) is a virtual Macintosh hard disk on your MAE Desktop. Normally, applications that could not be readily installed in MAE 1.0 install correctly to a TIV. See Chapter 3 of the MAE USER'S GUIDE, "Installing Macintosh Applications."
- MacTCP SUPPORT: MAE 2.0 supports MacTCP applications such as NCSA Telnet.
- EXTENSION MANAGEMENT: The Extensions Manager Control panel turns on and off startup programs, and switches between sets of extensions.
- SIMPLIFIED PROGRAM LAUNCH: The Launcher control panel opens a window that lets you launch frequently-used programs with one click.
- STICKIES: On-screen "yellow stickies" let you add notations to your desktop. They need not even all be yellow. Look for "Stickies" in the Apple Menu.
- WINDOW SHADE CONTROL PANEL: This new control panel allows you to reduce screen clutter by shrinking windows.
- SOFTWARE FPU: Support for SoftwareFPU (a shareware virtual 68881).
- CONTROL PANELS: New look for MAE General Control Panel; Network Control Panel for MAE allows the user to choose a default zone and to pick a network interface if the user has more than one; default RAM in Memory control panel is now 8MB (up from 5MB); the Desktop Patterns control panel provides a larger set of desktop patterns and textures.
- SOFTWARE TOOLS AND UTILITIES: HyperCard Player (apple/Tools); MoviePlayer (apple/Tools); third party utilities: Fetch, SoftwareFPU, and Disinfectant (apple/tools/Shareware); appleping and atlookup, AppleTalk debugging utilities (apple/bin).

MAE 2.0 Information Resources

=====

This Read Me File

This document contains vital last-minute notes on this version of MAE and its documentation. Please read the entire document before installing MAE. It is included as README.TXT in the root directory of the CD-ROM. In addition, when MAE 2.0 is installed on your workstation, a copy of this Readme file is made in the file "MAE_ReadMe_2.0" within the "apple" directory.

MAE Documentation

MAE 2.0 includes three manuals:

- MAE USERS GUIDE ("Macintosh Application Environment User's Guide"),
- MAE INSTALLATION MANUAL ("Macintosh Application Environment Setup and Installation Guide"),
- MAE SYSTEM ADMINISTRATOR'S MANUAL ("Macintosh Application Environment System Administrator's Guide")

A printed copy of the Installation manual accompanies the product CD-ROM. The other two documents, in Apple DocViewer format, are located in the subdirectory "DOCS" of your "apple" directory, and can be printed once MAE 2.0 is installed.

The MAE Internet Server Site

The MAE project maintains up-to-date MAE related information on world-wide-web and ftp servers, as follows:

www site URL: <http://www.mae.apple.com/>
ftp site: <ftp.support.apple.com>.

The following information is available:

- MAE Tech Notes: The most up-to-date list of current issues applicable to MAE 2.0
- Frequently-Asked Questions (FAQ): The questions most often asked by MAE users

MAE email Resources

Two mailing lists and one email address support MAE users:

- mae-announce is a moderated mailing list that will be used to distribute "official" product announcements and information about MAE from Apple. It is a very low traffic mailer aimed at people who want to keep informed on the product, but don't want to sift through all of the mail that is distributed through an open mailing list.

IMPORTANT: Apple strongly suggests that all MAE users subscribe to mae-announce. This mailing list is the primary means Apple will use to inform the MAE customer base about updates, patch availability and other significant MAE news.

- mae-users is an unmoderated mailing list that allows users to discuss the product in an informal atmosphere. mae-users will let users assist each other

and distribute hints and other information about the product.

- mae-bugs is a "one-way" email address to MAE Engineering. Its purpose is to allow users to submit comments, bugs and suggestions about MAE to Apple. Note that mae-bugs is NOT a replacement for your standard support channel. If Apple decides to respond to an mae-bugs submission, it will be done through the general mae-users mailing list.

To request information about how to subscribe to mae-announce or mae-users, or about submitting reports to mae-bugs, please send mail to "mae-info-mail@webster.mae.apple.com".

How To Proceed

=====

Before installing MAE, read the MAE INSTALLATION MANUAL, then the balance of this document. After you have installed MAE, you may find the information on the MAE ftp server, in the FAQ and MAE Tech Notes useful for solving commonly-encountered problems.

Tips, Cautions, And Last-Minute Release Notes

=====

The remainder of this document is functionally organized:

- I. Installing The Required Vendor Patches In Your Workstation Software
- II. Running The MAE Installer
- III. Running MAE For The First Time After Installation
- IV. Starting and Exiting MAE
- V. Issues Related To AppleTalk and Networking
- VI. Issues Related To Sound
- VII. Installing and Working With Application Programs
- VIII. Floppy Disks and CD-ROM Discs
- IX. Other Issues

Items applicable only to Sun workstations are labeled "(Sun only)"; those applicable only to HP workstations are labeled "(HP only)". All other items apply to all workstation types.

I. Installing The Required Vendor Patches In Your Workstation Software

The following patches for HP_UX and Solaris are the earliest versions that have been tested with MAE; Apple suggests that your system administrator apply the latest patch releases recommended by Sun and HP.

- (HP only): Copies of all HP patches can be obtained from the HP Support WWW server, whose URL is:

<http://support.mayfield.hp.com/>

The Patch Browse/Search/Download screen itself can be found at this URL:

http://support.mayfield.hp.com/slx/html/ptc_hpux.html

- (Sun only): Copies of Solaris patches are available on the Sun FTP site sunsite.unc.edu. Sun also maintains a WWW site, whose home page is at URL:

SunSolve home page: <http://sunsolve1.sun.com/>

The URL of the patches pages is:

SunSolve patches: <http://sunsolve1.sun.com/sunsolve/patches.html>

- (HP only): AppleTalk requires that the HPStreams module be installed in HP-UX. The STREAMS file sets are supplied on the CD in a "tar" file in directory STREAMS. Do not un-tar this file! The /etc/update program understands how to read the tar format. Two STREAMS packages are included: 3STREAMS.TAR and 5STREAMS.TAR. Please install 3STREAMS.TAR on HP-UX 9.03 and 5STREAMS.TAR on HP-UX 9.05.

The following file sets are included:

STREAMS
STREAMS-DLPI
STREAMS-MAN
TLI-XTI-MAN

Install all four file sets by using the /etc/update command:

```
/etc/update -rs /cdrom/STREAMS/3STREAMS.TAR '*'
```

-or-

```
/etc/update -rs /cdrom/STREAMS/5STREAMS.TAR '*'
```

WARNING: This command will reboot your workstation!

- (HP only): The recommended patches can be found in a single tar archive named HP_PATCH.TAR on the MAE CD-ROM in the PATCHES directory. Do not un-tar this file! The /etc/update program understands how to read the tar format.

The four patch file sets are listed below. (The versions of these patches may not be the latest available from HP, but have been tested with this release.)

PHKL_4605: This is a kernel "mega-patch" that fixes a number of important performance and reliability bugs, including an NFS memory leak and several bugs that can lead to kernel panics. This patch is relevant for users of HP-UX 9.03-9.05.

PHNE_3939: Kernel networking patch.

PHSS_4341: This patch fixes bugs in HP's audio server. "Issues Related to Sound" details the procedure required to install and enable this patch.

PHSS_4485: An X server patch.

To install any of these file sets, use the `/etc/update` command. This command requires the absolute path of the tar file and a list of the file sets to be installed. Use the `-r` option flag to tell update to reboot the system after installing the patches.

To install all four patches, use the following command:

```
/etc/update -rs /cdrom/PATCHES/HP_PATCH.TAR '*'
```

WARNING: This command will reboot your workstation!

- (Sun only): SOLARIS 2.4 SYSTEMS: ask your system administrator to verify that volume manager patch 102077 has been installed. This patch must be in place before you install MAE.

SOLARIS 2.3 SYSTEMS: we recommend you install Kernel Jumbo Patch 101318-59 (Sun has recalled version -60 through -68 of this patch)

These Solaris patches are available on the Sun FTP site sunsolve1.sun.com. Sun also maintains a WWW site, whose home page is at URL:

SunSolve home page: <http://sunsolve1.sun.com/>

The URL of the patches pages is:

SunSolve patches: <http://sunsolve1.sun.com/sunsolve/patches.html>

II. Running The MAE 2.0 Installer

- BACK UP ALL IMPORTANT FILES ON YOUR WORKSTATION. If you are upgrading an existing MAE installation, be sure to back up your MAE files. Beware: some UNIX backup utilities are incompatible with Macintosh file names (which contain spaces and 8-bit special characters, for example). Test yours!
- Read Chapter 1 of the MAE INSTALLATION MANUAL before running the installer.
- The most straightforward way to install MAE is to run the installer while logged onto your workstation as root. If you run as an ordinary user, it will be impossible for the installer to install system-level facilities, such as the Solaris Volume Manager Extensions and the AppleTalk kernel modules. You will also have to be root to install vendor patches on either Sun or HP.
- When you use the MAE 2.0 Installer to remove packages (such as the documentation of Reference Man Pages packages) you will be asked "In which directory do you want to install the <package>?"

This question should read "In which directory is the <package> installed?"

- If you have previously installed any version of MAE, and do not have a system folder, remove the file ~/.mac/hostname/sm.vpram

- IMPORTANT: RE-INSTALLING APPLTALK: If you have previously installed any release of MAE 2.0 (including any Beta release), be sure to use the MAE 2.0 Installer to remove AppleTalk BEFORE INSTALLING THIS RELEASE. Follow this procedure:

Step 1

Shut down any MAE sessions currently running.

Step 2

Log in as root.

ON HP, CONTINUE AS FOLLOWS:

Step 3

Rename the AppleTalk command in your target install directory. Example:

```
mv /u/MAEuser/apple/bin/appletalk /u/MAEuser/apple/bin/appletalk.old
```

Step 4

Use the Installer to remove the old AppleTalk kernel modules. Invoke the installer with ./INSTALL.SH -r, then, when prompted, verify that you want to remove the AppleTalk component.

Step 5

Use the installer to install the latest MAE in its entirety, including the new AppleTalk kernel modules.

Step 6

REBOOT your workstation.

Step 7

Remove the OLD AppleTalk command created in step 3 above. Example:

```
rm /u/MAEuser/apple/bin/appletalk.old
```

ON SOLARIS, FROM STEP 2 ABOVE:

Step 3

Use the installer to install the latest MAE in its entirety, including the AppleTalk new kernel modules.

Step 4

Reboot your machine to unload dynamically loaded AppleTalk kernel modules.

On either workstation type, the resulting MAE will come up with AppleTalk when the first session is invoked.

IMPORTANT: If you are running MAE off a (remote) NFS file server, you must still install the AppleTalk kernel modules on the local machine, if you want to use

AppleTalk. For example, if you are running the MAE process on workstation A, using a copy of apple/bin/MAE on workstation B, you must have the AppleTalk kernel modules installed on workstation A.

- The installer correctly upgrades your existing MAE 1.0 "apple" directory, if it exists, to version 2.0. The installer also updates the MAE documents and manual pages. Applications you have stored in the apple/Tools directory will not be removed. (However, if you have modified the MAE 1.0 versions of files that are replaced during the MAE 2.0 installation, your modifications will not be preserved during the installation.)

- If you are upgrading an existing MAE installation and will be installing new demo applications, remove the old directories "ClarisWorks", "FileMaker Pro", and "MacProject Pro" from the apple/Demos directory. Files from the old Demos directories that are not part of the new Demo set will otherwise be merged with the new Demo versions.

- MAE apple directories and System Folders cannot be cross-shared between Sun and HP workstations (as Macintosh applications and documents can).

- Installing MAE on an AFS volume may be problematic. MAE cannot be installed on an AFS volume at all unless the installing user is the superuser and has AFS administration privileges. Possible workarounds for residual difficulties: (1) upgrade to the latest release of AFS, which supports 8-bit characters in file names (2) install MAE onto a local or NFS mounted volume and then copy the MAE apple directory onto your AFS volume. (Remember: if you move the "apple" directory, you must use the "-appledir" command line option to start MAE.)

- (Sun only): During installation of MAE 2.0 into an AFS file system, very long AFS path names, or very large AFS volumes, may cause the installer to fail. The installer parses the output from the command "df -k"; the failure condition occurs when the path name or volume size fields run together without an intervening space. Before executing the installer, execute a "df -k" command to verify that these two fields are properly space-separated.

- (HP only) If you are running automounter and install MAE 2.0 into an automounted directory, specify the path in /tmp_mnt rather than /net (for example /tmp_mnt/net/foo/apple instead of /net/foo/apple).

- When running the installer, do not use destination directory names ending in special characters such as +, -, or &.

- Customizing the Install process for mass installation: Some sites have installed MAE on a central NFS or AFS server. Before undertaking support of such an installation, read Chapter 2 of the System Administrator's Guide, "Customizing MAE and Your Workstation."

- Problems with ISO 9660 format CD-ROM discs.

Some CD-ROM drivers (for example IBM, Data General) may translate filenames on ISO 9660 format CD's (such as the MAE CD) to lower case. If this occurs, the MAE Installer will not be able to find the files needed for installation.

To work around this, copy the files from the CD to a local volume and manually change the filenames to upper case before installing MAE. A shell script will be made available via anonymous ftp at some future time to automate the conversion of these file names.

This translation does not occur for Macintosh CDs.

MAE 2.0: Release Notes and Read Me, Part 2 of 2 (3/95)

Revised: 3/15/95
Security: Everyone

MAE 2.0: Release Notes and Read Me, Part 2 of 2 (3/95)

=====

Article Created: 16 March 1995

TOPIC -----

This article is part 2 of 2 of the README.TXT file for Macintosh Application Environment (MAE) version 2.0. This Read Me document should be read before installing or using MAE 2.0.

DISCUSSION -----

III. Running MAE For The First Time After Installation

- Before you can run MAE successfully, you must run the LICENSE BINDER utility, "license_binder". When you run the license binder, it will ask you to input a serial number. Your MAE 2.0 serial number is printed in two places: on the inside of the CD-ROM package, and on the plastic CD-ROM sleeve.
- The first time you launch MAE, it creates several files in your home directory:

These two directories are required to run MAE:

"System Folder"
".mac"

These are Macintosh aliases to the corresponding files inside the apple directory. Which aliases are created depends on which packages are installed; for example, if no demo packages were installed, there will not be a "demos" alias. These aliases are there for convenience to the MAE user, and may be removed at any time. To control which aliases are created, you can modify the AliasList file found in apple/lib and described in the MAE System Administrator's Guide.

"docs"
"demos"
"Tools"

"lib"
"man1"

• When MAE 2.0 is launched for the first time in a new installation, and encounters a System Folder from MAE 1.0 or from a beta version of MAE 2.0, it automatically converts the System Folder to the format correct for MAE 2.0. If you have installed a previous version of MAE 2.0, MAE will not create backup versions of the files it replaces in this process. (Upgrading from MAE 1.0, the updater will back up your original files.) In the unlikely event that you have trouble running MAE after the System Folder update occurs, follow this procedure:

Step 1
Quit MAE.

Step 2
Rename your System Folder; for example, 'mv System\ Folder old.system.folder

Step 3
Relaunch MAE to create a new System Folder.

Step 4
If you need Extensions or other files from the renamed System Folder, copy them to the new System Folder one at a time, restarting MAE after each new file is added to verify correct operation.

IV. Starting and Exiting MAE

- Do NOT delete or move any of the MAE files or folders located in the "apple" directory.
- Shift-Control-E forces MAE to quit

If you cannot quit MAE by using the Shut Down command in the Special menu (on the MAE desktop) or by using the capabilities provided by your X window manager, force MAE to terminate by pressing Shift-Control-E.

- If the Message "Can't open X display" Appears on Startup

If you are running MAE on the same workstation that you are running the X Server, set the DISPLAY environment variable to be "local:0" before running MAE. If you are running MAE on a machine other than the X Server, set the DISPLAY environment variable to the string "X_server_hostname:0" where X_server_hostname is the network hostname of the X server.

If MAE still will not open the display, run the program "xhost" on the X Server machine to ensure that you have access to the server; see the man page for xhost. If MAE is running on a workstation named WORKSTATION and the X-Server is on a machine named TERMINAL, then on TERMINAL run the command "xhost +WORKSTATION". This allows MAE on WORKSTATION to open a display on TERMINAL.

- If a message appears on startup similar to "Unable to locate <directory>;

please use the `-appledir` option to give the path to the apple directory."

When you start MAE, it expects the directory containing the MAE files to be in a directory specified at installation (by default, the directory is named "apple"). You can also specify the location of the "apple" directory to MAE by using the `-appledir` command option when you start MAE (see Chapter 2 of the MAE USER'S GUIDE). Alternatively, you can specify an alternate location of the "apple" directory in your X Resources file. To edit your X Resources file, open your `.Xdefaults` file and edit the line that begins with `"Apple.appleDirectory."` Replace the name of the directory that appears in the line with the name of the directory that contains the MAE files. For example, if the MAE files are located in `/usr/local/apple`, the line would look like this:

```
Mae.appleDirectory: /usr/local/apple
```

V. Issues Related To AppleTalk and Networking

- MAE is not compatible with third-party AppleTalk stacks. If you run on a machine with one of these stacks, you cannot use AppleTalk with MAE. If you want to run AppleTalk on MAE, you must first remove any third-party stacks.
- (HP only): MAE AppleTalk requires streams. To determine whether streams is installed on your system, run the command `'strv'` (normally in `/usr/bin`). To see which version of streams is installed, inspect the file `/system/STREAMS-DLPI/index` and look for the version in the `'fv:'` field.
- (Sun only): If you have a single network interface configured, and this interface is not `le0`, you will see the following message if you open the Network Control panel:

The AppleTalk connection is unknown. Please select a different AppleTalk connection, or built-in LocalTalk will be the AppleTalk connection when you restart.

This message is incorrect. Click 'OK'; the Network Control panel lets you switch between zones normally. AppleTalk and EtherTalk are unaffected, and will be normal after restart.

- By default, when you enable FileShare, anyone connecting as "owner" can see the entire `"/"` directory and its descendants. To allow access to only explicitly shared items, open the "Users & Groups" control panel, and turn off the option "Allow user to see entire disk" for the File Share owner.
- If multiple users invoke MAE and FileShare on the same workstation, some coordination is required in exporting filesystems with FileShare. If two users independently export a single directory or volume under two different names, then a second workstation, unable to recognize that the two exported names refer to the same volume, can mount them both independently, referring to them by different names. This has potentially serious consequences, including loss of files.

Sites that use multiple instances of MAE on a single workstation should provide

guidelines for exporting filesystems via FileShare. These guidelines should follow one of two models:

Item a

Run a single FileShare on the workstation, and set up Users&Groups to allow clients appropriate access to the File system.

Item b

Allow each user to run a FileShare server, but to export only parts of the file system they "own" in the UNIX sense. Default sharing of the root volume should be disabled.

- When using some MacTCP applications, erroneous login information may cause all subsequent connection attempts to fail. Work around this problem by restarting the application (it is not necessary to restart MAE).
- MacTCP and multiple network interface cards: MacTCP uses the first configured network interface card and ignores any others.
- Wrong zone: if the Chooser displays no network-visible entities (NVEs) (printers, servers, etc), the Chooser indicates that you are in an invalid zone, restart MAE.
- AppleTalk installation/initialization errors

If you see problems with AppleTalk initialization (for example, "Lap Init: ..."), do the following in order to determine the source of the problem:

Step 1

Check the system console messages.

Step 2

Verify that the AppleTalk kernel modules are installed correctly. See "Installing AppleTalk for MAE" in Chapter 5 of the MAE SYSTEM ADMINISTRATOR'S GUIDE.

Step 3

Be sure you have write permission to the /tmp directory.

Step 4

Look for error messages in the window from which you launched MAE. If AppleTalk is unable to open a file, an error message will appear here.

Step 5

Open the Network Control Panel; verify that you are running AppleTalk on the correct network interface.

Step 6

The MAE installer may have informed you that a log file was written. Please consult this file.

Step 7

For more information, see "Troubleshooting" and "UNIX AppleTalk commands" in

Chapter 5 of the MAE SYSTEM ADMINISTRATOR'S GUIDE.

- This release includes three UNIX-style commands for troubleshooting network problems. These commands are located in the apple/bin directory:

- appletalk
- appleping
- atlookup

Man pages for all three are included in the product release.

VI. Issues Related To Sound

- (HP only): MAE 2.0 will not support sound on HP-UX 9.01.
- (HP only): MAE 2.0 will not support sound on HP-UX workstations that are not connected to a network. If your HP workstation is not attached to a network, include the -nosound option on the MAE command line.
- MAE sound quality depends on the quality of the source sound, the processor speed, and the settings of the Sound control panel.
- MAE 2.0 does not support sound input.
- (HP only): Sound on HP workstations may include brief audio hesitations. This effect is most pronounced with higher sampling rates and slower machines.
- (Sun only): When changing sound rate on Sparc5s by using the Sound Out subpanel in the Sound control panel, there may be a slight delay during which your cursor stops moving. This is normal.
- (Sun only): The external mute and volume controls on the Sparc speaker box have no effect under MAE; sound is controlled only from the Sound Control panel.
- If multiple instances of MAE are run on the same workstation, only the first to be executed will play sounds normally. The other copies of MAE play no sounds until the first MAE terminates -- then they play all queued sounds at once. To avoid this, add the -nosound option to the MAE command line whenever another copy of MAE is already executing on the same workstation. This disables sound completely for all but the first copy of MAE to be executed.
- (HP only): UNIX applications that attempt to play sounds while MAE is running will have those sounds queued. These queued sounds will be played after the (first) MAE session quits.

This occurs because MAE takes exclusive control of the audio server in order to achieve acceptable sound performance. If you do not want this situation to occur and do not require sound support from MAE, start up MAE with the "-nosound" command line option.

- (HP only): If you don't get sound out of your machine even though it is sound

capable, check the following:

Step 1

Make sure the AUDIO environment variable is set to your local machine. That is, AUDIO=hostname:0

Step 2

Install HP Patch "PHSS_4341" and reboot. This patch is necessary for correct sound operation.

Step 3

Make sure the LLBD (local location broker daemon) is running. As root, edit the /etc/netnsrc file and make sure the line START_LLBD=1 is there, and reboot.

Step 4

Make sure the audio server is running (ps -e | grep -i aserver). There should be two Aserver processes running. Use the command "/usr/audio/bin/Aserver" to start the audio server if necessary.

Step 5

Make sure you have access to the Aserver. "/usr/audio/bin/asecure -C" creates an audio access file. Then "/usr/audio/bin/asecure -d" disables security (or read the man page and enable for the users to whom you wish to grant access).

Step 6

To get audio out of the output jacks (rather than the internal speaker) set the environment variable SPEAKER="external".

Step 7

If you're still having problems, try to get HP's audio tools to work following their documentation. When HP's audio tools work, MAE sound should work.

- (Sun only): Sound problems related to running MAE as a user different from the one who is logged in at the console:

Change the permissions of the /dev/audio and /dev/audioctl audio devices. To change the permissions of /dev/audio, execute the command "ls -l /dev/audio" and follow the symbolic links to the actual device (expect three or four levels of indirection). Change the permissions on the audio device for read/write access.

VII. Installing and Working With Application Programs

- Using Temporary Installer Volumes (TIVs) to ease application installation: Installation of some applications can be complicated by space and permissions constraints on the UNIX root volume. The resulting problems are likely to produce error messages such as

"Not enough free space on <directory>"

"Cannot create directory <directory>"

MAE 2.0 provides a workaround: a TIV, which is a virtual hard disk on the MAE

desktop. By creating, and installing to, a TIV, you can sidestep problems associated with the root volume.

Detailed instructions for creating and using TIVs are in Chapter 3 of the MAE USER'S GUIDE.

- Installation of certain software packages can be done only by using a TIV that contains a copy of your System folder. Attempts to install on a TIV without a System Folder result in various error messages, depending on the installer. See Chapter 3 of the MAE USER'S GUIDE.

- TIV size: We recommend a TIV size greater than 10 Megabytes.

- If you get a message such as "ClariscDraw requires a hard disk" when installing a Claris application

Some Claris applications require that the destination volume have more than 10 MB free space, even though the application does not require that much space. To work around the problem, install to a TIV whose size is greater than 10 Megabytes.

- Resizing MAE while an application is running

Some applications may not correctly handle an MAE resize while the application is running.

- Colors Are Not Displayed Accurately in Certain Applications

In certain applications that use color extensively (for example, Adobe Photoshop), colors used in the document may not be displayed correctly. To fix this problem, open the MAE General control panel; click the button "use standard Mac colors" under "Color flash reduction" and restart MAE.

- Use only printer drivers that are shipped with MAE

Some Macintosh applications (for example, Aldus PageMaker 5.0) install their own printer drivers (and related files) when installed. The only printer drivers that have been tested for compatibility with MAE are shipped with the product: LprWriter and LaserWriter 8. Other printer drivers have not been tested with MAE and may not work.

For instructions for setting up and using the LprWriter and LaserWriter drivers, see Chapter 4 of the MAE USER'S GUIDE, "Printing in MAE."

- PPD files for non-Apple printers

Apple supports only PPD files for Apple printers. It is a printer vendor's responsibility to make PPD files for its printers available. If the PPD for your non-Apple printer isn't shipped with MAE, contact the printer vendor or use the ftp archive at <ftp.adobe.com>. See Chapter 4 of the User's Guide for more information.

- Problems with Microsoft Office

The specialized Microsoft Office Control panel "Microsoft Office Manager" is not compatible with MAE. If you install Microsoft Office, remove this control panel from the System Folder before you restart MAE.

- Use the Option Key When Printing PageMaker 5.0 Documents with LprWriter

There is an incompatibility between the LprWriter driver and PageMaker. If you are printing using the LprWriter driver, you must hold down the Option key while you choose Print from the File menu in PageMaker. There is no incompatibility with the LaserWriter 8 driver.

VIII. Floppy Disks and CD-ROM Discs

- (Sun only): Volume manager patch

Solaris 2.4 users: Before using floppy or CD-ROM with MAE on Sun, you must install the Solaris Volume Manager Patch.

- Problems mounting CD-ROM discs and floppy disks

Read "Mounting CD-ROM Discs and Floppy Disks" in Chapter 6 of the User's Guide. If your problem is not covered, read on (this material assumes that you know the concepts covered in the User's Guide).

You need to know the exact path name of the device file that references the CD-ROM or floppy (ask your system administrator). On HP, the command:

```
ioscan -f
```

Lists the available devices on your workstation. On Solaris, you should be able to determine the path name(s) by looking in the /etc/vold.conf file for the lines that start with "use floppy" or "use cdrom".

The driver for the device in question may not be configured in your kernel. Ask your administrator for help if this is the case.

Once you know the path name of the device file, try to access the floppy drive from UNIX. Once you have determined that the floppy drive works, enter full path name for the floppy in the macdisks.OS file (where OS is 'hpux' or 'solaris').

Example SCSI entry for a CD-ROM drive:
scsi6:removable:ro:<PUT PATH NAME HERE>

Example line for a floppy drive:
floppy0:rw:<PUT PATH NAME HERE>

Common path names for devices:

On HP, CD-ROM drives are often at SCSI address 2. The following example line should work if your CD-ROM drive is at SCSI address 2:

```
scsi2:removable:ro:/dev/dsk/c201d2s0
```

On HP, Floppy drives are often one of the following:

```
floppy0:rw:/dev/rfloppy/c201d0s0
```

```
floppy0:rw:/dev/rfloppy/c20Ad1s0
```

In some cases, you may need to restart MAE before the modifications to the macdisks.OS file will be taken into account, especially if you specify "default" for one of the devices.

- Do not eject a diskette and physically remove it from the drive until MAE is finished with it (that is, until MAE shuts down, requests another disk with a dialog, or deletes the floppy disk icon from the desktop). Disregarding this caution risks physical diskette damage.

- (HP only): If you manually eject a floppy without dismounting it first (dismount it by dragging its icon to the trash, or selecting Put Away from the File menu), and then insert another floppy, the second floppy may be corrupted.

IX. Other Issues

- Find File and UNIX file systems

The "Find File" facility included with MAE 2.0 is optimized for searching Macintosh HFS volumes and is not well suited to large UNIX filesystems. Avoid using this facility to search UNIX volumes as it will traverse the entire volume and any mounted filesystems within it. This behavior is especially noticeable when "Find File" is invoked by a remote client to search a UNIX volume exported from MAE via File Sharing. Using "Find File" on HFS volumes (such as TIV files or remote HFS volumes) should present no difficulties.

- File System anomalies

If MAE fails to show items in a UNIX directory (possibly even after the window is closed and re-opened), use the touch command to update the time on some item in the directory. (This anomaly is the result of a difference in basic assumptions between UNIX and the Macintosh: Using UNIX, it is possible to replace an entire directory, with entirely new contents, without updating its modification date or time.)

- Using -memory Option When Starting MAE

When you start MAE with the -memory command option, memory size is set to the specified value. (See "Adjusting the Memory Size of MAE" in the MAE USER'S GUIDE, Chapter 10.) If MAE is restarted, this stipulation will remain in effect unless it has been subsequently changed by using the Memory Control panel.

- OPTION and SHIFT keys after MAE restart

After an MAE restart (not a startup), MAE may appear not to respond fully to the Option and Shift keys. A simple workaround technique is effective: click

anywhere OUTSIDE THE MAE WINDOW on your X screen, then click inside the MAE window. Thereafter the problem disappears.

- Scrapbook conversion: The Scrapbook file format of MAE 2.0 is not compatible with that of MAE 1.0. If you update from MAE 1.0, your Scrapbook file will be unusable. To work around this, copy the new Scrapbook file from apple/sys into your System Folder, replacing the one there. To recover the contents of your MAE 1.0 Scrapbook:

- run MAE 1.0, using your old MAE 1.0 appledir and System Folder; the old system folder is saved in "MAE 1.0 System Files", within your MAE 2.0 System Folder.

- Paste the Scrapbook contents into an application document and save it.

- Terminate MAE 1.0, run MAE 2.0, open the application, and paste the contents into the Scrapbook.

- MEMORY CONTROL PANEL: Allocating the maximum memory allowed in the Memory control panel may result in an MAE crash with "mmap failed" or other error messages.

- ALIASES: installing this release invalidates Macintosh aliases from the previous installation. Discard these aliases and re-create them.

- WARNING: Some versions of AFS support only 7 bit characters in filenames, while MAE supports 8 bit characters. This may cause problems in some situations: BEWARE!

- MAE does not support changing the date and time settings in the General Controls and Date & Time control panels.

- SCSI device compatibility problems

Workstations that support MAE 2.0 typically use the SCSI 2 interface Standard. Depending on how your workstation is configured, you may have problems using a SCSI or single-ended SCSI 2 peripheral. Before attempting to connect an Apple or other third-party peripheral to your HP or Sun workstation, see your system administrator or the documentation that came with your workstation for information.

- (HP only): Problems Using CD-ROM Discs on HP 712 Workstations

If you try to mount a CD-ROM disc on certain HP 712 workstations attached to some CD-ROM drives, MAE may display an alert message, asking if you want to initialize the disk. Click Cancel in the alert box. For information about possible solutions to this situation, see your HP dealer or contact technical support at Hewlett-Packard.

- If MAE "hangs" when an NFS server goes down:

MAE 2.0 no longer hangs on NFS mounts when an NFS server goes down, unless the server was mounted "hard/nointr." Hard/nointr mounts cannot be interrupted while hard/intr are interruptible. To prevent NFS-related hangups, verify that all NFS

mounts on your workstation are interruptible.

- If you need to refer to the wide-area part of a distributed AFS filesystem:

MAE does not permit the Finder or applications to see the wide-area part of the distributed AFS filesystem. To access a file contained in the wide-area part of an AFS system, use a UNIX shell to copy the file to a directory within the local cell, such as your home directory.

- If resizing the MAE window when CloseView is active causes MAE problems:

This is a known problem in the current version. Avoid resizing the MAE window when CloseView is active.

- (Sun only): If you are using OpenLook

If you are having trouble importing X data into the MAE environment (for example, text in an xterm window), make sure that you do not click on any olwm title bar after you have selected the X data. If you do so, the X Windows selection may become lost, and MAE will not be able to import it. To work around this problem, position the MAE window so the "Import from X" button (on the MAE toolbar) is visible, select the X data, then before clicking on any olwm titlebar, select the "Import from X" button.

- Displaying MAE on a Macintosh using MacX.

MAE may hang when its display appears on a Macintosh via MacX, when MAE is also mounting a fileshared volume from the same Macintosh.

- AfterDark 3.0

The files "Screen Posters" and "Bad Dog" in AfterDark version 3.0 are incompatible with MAE 2.0. After installing After Dark, remove these two files from your System Folder before restarting MAE.

- Shareware/freeware issues

MAE 2.0 includes three shareware/freeware programs, in the directory apple/Tools/Shareware. Observe these points when using these shareware programs:

- Third party software posted to this CD may be protected by federal copyright laws which prohibit copying unless authorized by the copyright owner. Before using any posted software, refer to the start up screen of the software, to the accompanying software license, or to the individual an/or company posting the software to determine if copying is authorized. Posted software is the sole responsibility of the individual and/or company posting it. Apple Computer, Inc. does not endorse, warrant, guarantee, or make any representations, express or implied, with respect to software posted to this CD, its quality, performance, merchantability, or fitness for a particular purpose. In no event will Apple be liable for direct, indirect, special, incidental, or consequential damages resulting from the use of posted software.

- Some software in this folder is shareware; if you use a shareware utility, please honor its shareware fee.

- FETCH: Using Fetch to "get" and "put" non-text Macintosh files from or to UNIX filesystems requires special care to insure the files are transferred in a usable state by MAE (that is preserving their AppleSingle format).

When "get"ing a non-text Macintosh file, always select "binary" transfer mode. When "put"ing a non-text Macintosh file, always select "AppleSingle" as the file format when prompted by the dialog. Macintosh and UNIX text files should always be transferred by selecting "text" (ASCII) transfer mode.

For complete instructions about using Fetch, read the online "Fetch Help".

- SOFTWAREFPU - Floating Point Unit Extension

This extension simulates the FPU coprocessor chip found in some Macintoshes and integrated into certain 68K CPU's. It is only useful for (the very few) Macintosh applications that require this FPU.

Complete instructions about using SoftwareFPU are included with the utility.

- DISINFECTANT - Virus Utility

MAE is susceptible to the same viruses that plague the Macintosh. However, there is no need to scan your entire UNIX filesystem for Macintosh viruses. When scanning with Disinfectant, hold down the Option key and press the "Scan" button, this will display a dialog that will allow you to limit the scope of the search.

For complete instructions about using Disinfectant, please read the online "Disinfectant Help".

PowerMac DebugServices 2.0b12 Incompatibility (3/95)

Revised: 3/16/95
Security: Everyone

PowerMac DebugServices 2.0b12 Incompatibility (3/95)

=====

Article Created: 16 March 1995

TOPIC -----

This article describes a PowerMac DebugServices 2.0b12 and Macintosh System 7.5 Update 1.0 incompatibility.

DISCUSSION -----

PowerMac DebugServices 2.0b12 is not compatible with Macintosh System 7.5 Update 1.0. You need to upgrade to PowerMac DebugServices 2.0b14. This version of PowerMac DebugServices may not work with hosts earlier than those found on ETO 16. Please contact the manufacturer of your development environment if you encounter a problem using PowerMac DebugServices 2.0b14 with your development environment.

MAE 2.0: Using the Sound Manager (3/95)

Revised: 3/16/95
Security: Everyone

MAE 2.0: Using the Sound Manager (3/95)

=====

Article Created: 16 March 1995

TOPIC -----

This article describes the Sound Manager in Macintosh Application Environment (MAE) version 2.

DISCUSSION -----

The Sound Manager in MAE version 2 acts transparently, much like the sound manager on the Macintosh. However, there are some setup issues and concerns for the different platforms. In addition, MAE is constrained by the host resources, which add performance issues.

Most current Macintosh programs that utilize sound use a sampling rate of 22kHz or less. The MAE Sound control panel allows you to set the audio output resolution to whatever the hardware allows. For best performance, set the sampling rate to 11 or 22kHz.

When executing multiple instances of MAE on a single workstation, only the first MAE instance will be able to use sound.

Hewlett Packard (HP) workstations

The Hewlett Packard sound implementation uses the Audio Server that is available on all sound-enabled HP platforms. The Audio Server should be updated with HP's patches to the latest level in order to make sound work correctly. The patch PHSS_4341 is currently necessary for correct operation. See the Read Me file (README.TXT) on the MAE CD-ROM for the latest information on patches.

Sound is not supported in HP-UX releases earlier than 9.03.

To determine if the patch has been installed, check for the file /usr/audio/bin/asecure. If this file is present, it is likely that the patch has been installed and MAE should function correctly.

HP audio will work only locally on the host Audio Server, by default. To enable a remote Audio Server, set the AUDIO environment variable to the Audio Server to which you want to send sound output.

There are a number of useful environment variables for sound.

- AUDIO specifies the Audio Server to send data to; for example, set the AUDIO environment variable to <hostname>:0.
- SPEAKER specifies destination for the sound. Set the SPEAKER variable to INTERNAL (which is the default) to use the internal speaker. Set it to EXTERNAL to send the sound to an output jack.

Troubleshooting for HP workstations

A list of potential problems and their solutions follows.

- Problem: Audio Server has been updated but no sound is produced.

Solution 1: Audio security may be enabled. Refer to the man page for the asecure command to enable sound output. The default configuration for the audio security is to disable sound output for all users. The asecure program enables access for any or all users of the target machine.

Solution 2: Increase the system volume. Use the program /usr/audio/bin/acontrol and increase the playback volume.

- Problem: MAE is running remotely, but no sound is produced.

Solution: If the display server is not equipped with an Audio Server (that is, it is not an HP workstation) you cannot get sound on it. If it is, before launching MAE set the AUDIO environment variable to the name of your display (that is, export AUDIO=<hostname>:0) on the machine that will run the MAE process.

- Problem: MAE sound hesitates; that is, there are intermittent silent portions in the sound output.

Solution: Run MAE on a faster machine or turn down the sampling rate in the Sound control panel. The higher the resolution of the sound, the more resources are necessary to produce the sound. Reduce the resources necessary by lowering the sampling rate.

Sun workstations

If the Sun workstation is sound capable, MAE sound will work with it. If the user who is running MAE is different from the one logged into the console, you must change the permissions of the audio devices with the following command line:

```
ls -la /dev/audio
```

Then follow the links to find the actual device (there are three or four levels of symbolic links). As superuser, you will need to change the permissions of the audio device to read/write access in order to enable sound.

NOTE: You must change the permissions for both /dev/audio and /dev/audioctl for sound to operate.

Troubleshooting for Sun workstations

- Problem: MAE does not produce sound.

Solution 1: Make sure you are logged into the console or have the permissions on /dev/audio and /dev/audioctl set correctly for your user. See the first two paragraphs under "Sun Workstations," above, for details about permissions on added devices.

Solution 2: Press the mute button on the speaker box (if available). If the speaker box is muted, no sound is available.

Solution 3: Turn up the volume on the speaker box or in the Sound control panel.

- Problem: MAE sound hesitates.

Solution: Run MAE on a faster machine or turn down the sampling rate in the Sound control panel. The higher the resolution of the sound, the more resources are necessary to produce the sound. Reduce the resources necessary by lowering the sampling rate.

Power Performa: Flashing Phone Icon in Menu Bar (3/95)

Revised: 3/17/95
Security: Everyone

Power Performa: Flashing Phone Icon in Menu Bar (3/95)

=====

Article Created: 17 March 1995

TOPIC -----

I have a flashing, green telephone icon over the date and time on my menu bar. When I click on the telephone icon, a message states "Select a contact file...". Another dialog box then asks me to "Select a contact file...".

I have a Power Performa 611X. What is this and how do I turn it off?

DISCUSSION -----

The Power Performa computers have the Now Contact software installed. A part of the Now Contact software is a control panel called QuickContact. When the QuickContact menu icon is turned on in the control panel, this flashing telephone icon appears over the date and time on the menu bar. It's purpose is to allow quick access to a user's contact files.

To turn it off, open the QuickContact control panel and click off on the QuickContact menu icon setting.

This issue will hold true for any computer running Now Contact 1.1.

LaserWriter 16/600 PS: Fuser Temperature (1/97)

Revised: 1/29/97
Security: Everyone

LaserWriter 16/600 PS: Fuser Temperature (1/97)

Article Created: 17 March 1995
Article Reviewed/Updated: 29 January 1997

TOPIC -----

What is the fuser temperature for the LaserWriter 16/600 PS?

DISCUSSION -----

The target fuser temperatures for the LaserWriter 16/600 PS are as follows:

	Normal Temp. Control	Initial Warm-Up Control
=====	=====	=====
NON-PRINTING		

Wait	175°C (347°F)	190°C (374°F)
Standby	175°C (347°F)	190°C (374°F)
Auto Delivery	175°C (347°F)	190°C (374°F)
Initial Rotation	175°C (347°F)	190°C (374°F)

PRINTING		

Long Interval Printing	195°C (383°F)	195°C (383°F)
Continuous Printing	200°C (392°F)	205°C (401°F)
Intermittent Printing	185°C (365°F)	195°C (383°F)
Envelopes (<25)	190°C (374°F)	190°C (374°F)
Envelopes (>25)	180°C (356°F)	190°C (374°F)
B5 Envelope	200°C (392°F)	205°C (401°F)
1st Print from MP Tray	195°C (383°F)	195°C (383°F)

The initial warm-up control is initiated for the first 5 minutes whenever the initial temperature detected by the thermistor is 50°C (122°F) or less to improve fusing.

The fuser is not kept warm whenever the printer is in the Energy Saver mode.

HyperCard: MacPaint Setting Prints 4 Pages Per Card (5/95)

Revised: 5/19/95
Security: Everyone

HyperCard: MacPaint Setting Prints 4 Pages Per Card (5/95)

=====

Article Created: 17 March 1995
Article Reviewed/Updated 18 May 1995

TOPIC -----

I am having some difficulty printing from HyperCard. I create a stack with the card size set to MacPaint. Then I choose Print Card from the File menu. Multiple pages print out for each card! The first page has the card with all the correct information. The second, third, and fourth pages will be blank.

Is this the way HyperCard is suppose to work? Why does it print out 4 pages for every 1 card? Is there a fix for this, or some workaround?

DISCUSSION -----

This HyperCard behavior is not entirely unexpected because some applications have a large print area (for example, the typical MacPaint card size has a fairly large print area). This can result in each card actually requiring more than a single page to print.

Examples Using Different Printers

This example uses a one card stack with a MacPaint sized card. The paint bucket tool was used to fill in a fairly dense pattern on the card to help see what is being printed. Two pages printed on a LaserWriter Pro 630.

The MacPaint card size is 576 pixels by 720 pixels. This card image is a little wider than the image area of the LaserWriter Pro 630, so the second page held a "sliver" of the right hand side of the card.

When resizing the card size of a stack, HyperCard forces pixel sizes of a multiple of 32 pixels for the width and 8 pixels for the height.

By resizing the card width from 576 pixels down to 544 pixels, the card printed on one page. A stack sized at 544 pixels wide by 736 pixels high printed on two pages with a sliver of the bottom of the card on the second page. A stack sized

at 576 pixels wide by 736 pixels high, printed on four pages with a slivers of the right and bottom of the card on the second and third pages and the fourth page had a tiny square from the lower right of the card.

Depending on the printer used, a large sized card may need to be spread over multiple pages to show the whole card image. If there is not any kind of pattern near the right and bottom of the cards then the extra pages may appear to be just extra blank pages, when actually they represent boundaries of the card image. Be sure after resizing a stack that the fill pattern extends to the bottom of the newly sized cards. The pattern does not propagate just because the card is made larger.

The way the card prints out depends on the pixel imaging size of your printer. Another factor that could have an effect on this printing situation, in a non-QuickDraw GX environment, is whether you have set the Page Setup Options to have a larger imaging area available by choosing fewer downloadable fonts.

At Ease Version 2.0.4 Not Available in the U.S. (3/95)

Revised: 3/17/95
Security: Everyone

At Ease Version 2.0.4 Not Available in the U.S. (3/95)

=====

Article Created: 17 March 1995

TOPIC -----

I have heard about an At Ease version 2.0.4. How do I get it, or does it even exist?

DISCUSSION -----

It does exist, however, it is not supported or available in the United States. It was created specifically to fix some problems with At Ease unique to the Japanese version. It has no new features as compared to version 2.0.3. At Ease version 2.0.3 is the latest version intended for and supported in U.S. markets.

Application Size: Different for Native PowerPC and 680x0 (5/95)

Revised: 5/19/95
Security: Everyone

Application Size: Different for Native PowerPC and 680x0 (5/95)

=====

Article Created: 20 March 1995
Article Reviewed/Updated: 3 May 1995

TOPIC -----

I have noticed that the amount of memory in use by an application in the "About This Macintosh" dialog box does not always match the memory allocated to the application in the Get Info dialog. This only seems to occur with PowerPC native applications when running with Extensions off.

For example, using ClarisWorks 3.0, the preferred memory size shown in the Get Info dialog box is 950K, but after launching the application, "About this Macintosh" shows it using 2,054K.

DISCUSSION -----

A PowerPC native application has different memory requirements when running on a 680x0 or a PowerPC based computer. Additionally, the Finder does not recognize the memory allocation settings of native applications. To do so, it requires the PowerPC Finder Update (7.1.2 or 7.5) or Finder Update (7.5 with System 7.5 Update 1.0). Starting your computer with extensions off disables the Update. Without the Update active, the Get Info dialog box shows the memory allocation for the application as if it were running on a 680x0 based computer.

The system software, however, sees the proper memory allocation for the native application and allocates the correct amount of memory to the application when it loads. This is why the higher memory usage appears in the About This Macintosh dialog box.

In the preceding example, ClarisWorks on a 680x0 computer has a preferred size of 950K by default. On a Power Macintosh, because it is a native application, it has a preferred size of 2,054K. Without the Finder Update, the Finder reports the first preferred size in the Get Info dialog but the System uses the second size.

Always make sure that the proper Finder Update has loaded at startup before

trying to adjust memory allocation on a native Power Macintosh application. The Finder Updates also generate the message at the bottom of the Get Info dialog explaining that memory allocations go up or down if you turn virtual memory on or off. If you do not see this message when looking at the Get Info dialog of native application, the Finder Update did not load.

The Update does not show up in the Extensions Manager control panel. You must look in the Extensions folder to confirm its presence.

Macintosh Tutorial: Where is Part II? (5/95)

Revised: 5/19/95
Security: Everyone

Macintosh Tutorial: Where is Part II? (5/95)

=====

Article Created: 20 March 1995
Article Reviewed/Updated: 5 May 1995

TOPIC -----

Some customers have reported that they can find Part I of the Macintosh Tutorial on their hard drives, but cannot find Part II anywhere either on the System 7.5 CD-ROM or on the hard drive.

DISCUSSION -----

Part I and Part II of the Macintosh Tutorial were created in different applications and saved as different types of documents, which is causing the confusion.

Installation
=====

To make sure that the Macintosh Tutorial runs correctly, you must first run the Macintosh Tutorial Installer from the System 7.5 CD that came with your Macintosh computer. To run the Installer, double-click its icon and select Install (onto your hard drive).

Note:
The Macintosh Tutorial does not come on the System 7.5 floppy disks; it only comes on the System 7.5 CD.

The software installs a file called Macintosh Tutorial (an Apple Guide file) and a folder called Tutorial Items into the Extensions folder inside the System Folder. You cannot run the Macintosh Tutorial program directly from the CD.

Correct Way to Run Tutorial
=====

From the Finder, At Ease Not Installed

Select the Macintosh Tutorial option in the Help menu (the balloon with a question mark in the upper right of the Menu Bar). This opens an Apple Guide screen giving you the option to open Part I or Part II. If you select Part I, Apple Guide automatically opens the MacroMind Director file and runs through it.

When you quit or finish Part I, it takes you back to the initial Apple Guide Macintosh Tutorial screen, where you can select either Part I or Part II. If you select Part II, the tutorial starts into an Apple Guide tutorial (not MacroMind Director). In other words, Part II is encapsulated in the Macintosh Tutorial Apple Guide file while Part I is a stand-alone MacroMind Director file.

From the Finder, At Ease Installed

If At Ease is installed, the computer must be set to Go to the Finder at startup in order to properly access the Macintosh Tutorial through Apple Guide. If you are running At Ease, and your computer goes into At Ease at startup rather than the Finder, then you do not have access to the Apple Guide. In this case, the only access to Macintosh Tutorial is through the Tutorial Items folder, which does not find Part II because it is an Apple Guide file, not a MacroMind Director file.

NOTE:

See the TIL article titled "System 7.5: At Ease, KidDesk & Apple Guide Are Compatible" for more information about using Apple Guide with At Ease.

Incorrect Way to Run Tutorial

=====

Many users try to run the tutorial from within the Tutorial Items folder instead of using the Help menu. This folder contains a MacroMind Director file called Macintosh Tutorial Part I and its associated data files. If you double click on Part I, it opens and runs Part I of the tutorial. When you get to the end or quit in the middle, it takes you back to the Finder without the option of going to Part II. This is not the way the Macintosh Tutorial was intended to be used. It was only intended to be run from within Apple Guide.

Summary

=====

You cannot run the tutorial from the CD-ROM without first installing it onto your hard drive. Nor can you properly run the Macintosh Tutorial from inside the System Folder by double-clicking on the Part I MacroMind Director file. For the tutorial to run properly, you must run it from the Help Menu. This is the only way you can "find" and run Part II of the tutorial.

AWS 95: Install Oracle on Raw Slice or Free Slice 3 (3/95)

Article Created: 20 March 1995

TOPIC -----

On an Apple Workgroup Server (AWS) 95 I have a question about an Oracle installation and partitions. I've been told that Oracle data drives require a raw partition, and are not mounted as a mount point. Is this true?

DISCUSSION -----

Oracle does work in a raw partition, however, Oracle does NOT require a raw partition. Oracle will work fine on a free UNIX Slice 3 partition.

Oracle Tech Support suggests using a Slice 3 partition instead of a Raw partition. They claim the increase in speed with a Raw partition is not worth the trouble for Macintosh users to deal with UNIX directly. It's much easier for most users to be in the familiar Macintosh environment to manipulate their Oracle Database files.

Below are some of the advantages and disadvantages of both:

Raw Slice

Advantages:

- Fastest access to hard drive (no file system overhead)

Disadvantages:

- Have to use tar or other UNIX utilities to backup partition
- Can't use Finder to see directory structure

Free UNIX Slice 3

Advantages:

- Can use Retrospect to backup the partition
- Can use finder to navigate file structure

Disadvantages:

- Slightly slower

Using the Bridge along with other network products

- If you already have the LaserWriter Bridge installed
- If you are using the Apple Internet Router
- If you are using the SNA•ps Gateway
- If you are using MacIPX
- If you are using SoftWindows

If printers don't show up on the network

Summary of enhancements

What the LocalTalk Bridge Installer disk includes

For more network software information

Using the Bridge along with other network products

• If you already have the LaserWriter Bridge installed: Installing the LocalTalk Bridge automatically removes any existing version of the LaserWriter Bridge. Only one bridge product can operate on a computer at a time, and the LocalTalk Bridge provides all the functions of the LaserWriter Bridge, and more.

• If you are using the Apple Internet Router: Note that you can't install or use the Bridge on a computer that has the Router installed. If there is a Router on your network, be sure to install the Bridge on a computer other than the one

that has the Router software.

Also, the Apple Internet Router can run on the Ethernet or Token Ring network to which the bridge computer is connected. However, you can't run the Bridge software and the Router software on the same LocalTalk segment.

- If you are using the SNA•ps gateway: To use this release of the LocalTalk Bridge Installer with a SNA•ps gateway, use Custom Install to install TokenTalk for Token Ring 4/16 NB Card w/SNA•ps. The SNA•ps gateway is not currently supported on the Token Ring NB or Token Ring NB/c cards.
- If you are using MacIPX: The Token Ring driver is not compatible with MacIPX versions 1.1 and older. Contact Novell Technical Support to obtain newer MacIPX software that works with the Token Ring drivers on this disk.
- If you are using SoftWindows: SoftWindows versions 1.0 and 1.0.1 using SMB (NetBEUI) protocols over Token Ring aren't completely compatible with the latest version of AppleTalk. Contact Insignia Solutions to obtain the SoftWindows software update that works with the AppleTalk drivers provided on this disk.

If printers don't show up on the network

If there are printers on the network that don't appear after you install the LocalTalk Bridge, turn the printer power off and then back on again. This enables the printer to acquire a current network address.

What the LocalTalk Bridge Installer disk includes

Easy Install installs this software on your computer:

- Apple LocalTalk Bridge version 2.0
- AppleTalk version 58.1.5
- Network Control Panel version 3.0.2
- EtherTalk version 2.5.7 or TokenTalk version 2.5.7, depending on your network

You can use Custom Install to install any of these additional software products:

- Apple Built-In Ethernet version 1.0.1
- Apple Ethernet NB version 1.0.1
- Apple Ethernet LC version 1.0.1
- Apple Ethernet CS version 1.0.1
- TokenTalk version 2.5.7
- Token Ring Control Panel version 1.0.1

- Update to Token Ring driver version 2.5.2 for the TokenTalk NB Card
- Update to Token Ring driver version 1.0.2 for the Token Ring 4/16 NB and Token Ring NB/c Card
- A/ROSE 1.2.1, for use in some Token Ring configurations

For a more complete description of these items, click the "i" box that appears on the Custom Install menu. For full descriptions of these drivers and other network software information, you may want to obtain a copy of the Network Software Installer, as described in the following section.

For More Network Software Information

The Network Software Installer (NSI) contains information and software that might be of use in certain network configurations, for example, to ensure compatibility in mixed-network environments, or to remedy some network problems. You can obtain the NSI free-of-charge by requesting it through the Internet (ftp.apple.com). You can also request the Network Software Installer through the Apple Network Information Fax line at (408) 974-7977.

System 7.5.1: PC Setup 1.0.2 Not Compat w/DOS Compat (10/95)

Revised: 10/23/95
Security: Everyone

System 7.5.1: PC Setup 1.0.2 Not Compat w/DOS Compat (10/95)

Article Created: 20 March 1995
Article Reviewed/Updated: 23 October 1995

TOPIC -----

When I installed the System 7.5 Update 1.0, I ended up with an older version of the PC Setup Control Panel than what I used to have. What happened?

DISCUSSION -----

The System 7.5 Update 1.0 includes PC Setup control panel version 1.0.2, which is older than the PC Setup control panel that came with Macintosh DOS Compatible computers.

If you choose the Custom Install option for the Macintosh DOS Compatible when you run the System 7.5 Update 1.0 Installer, your newer version of the PC Setup control panel is replaced. The Easy Install option leaves the newer version in your system untouched.

Older Control Panel Not Compatible

PC Setup Control Panel version 1.0.2 is not compatible with the Power Macintosh 6100, Macintosh LC 630, or Performa 640 DOS Compatible computers. The Macintosh Quadra 610 DOS Compatible, however, works fine with PC Setup Control Panel 1.0.2 or earlier, so installing the System 7.5 Update 1.0 on this computer has no affect on compatibility of the PC Setup control panel.

Reinstalling the System 7.5 Update

If you need to reinstall System 7.5 Update 1.0, please note the following installation order. To avoid reinstalling PC Setup v.1.0.2, reinstall System Software in the following order:

Step 1

Install System 7.5.

Step 2

Install software for your DOS Compatibility card. Follow the installation instructions in the DOS Compatibility ReadMe.

Step 3

Install System 7.5 Update 1.0 (Easy Install).

Step 4

Install any other software.

IMPORTANT NOTE:

Installing System 7.5 Update 1.0 prior to the installation of your DOS Compatibility software will first install PC Setup v.1.0.2, which may prevent you from proceeding with DOS installation.

Custom Install

Doing a Custom Install of either System 7.5 Update or control panels installs PC Setup v.1.0.2 on your system. This control panel is not compatible with your system. If you need to do a custom install, you must specifically exclude PC Setup v.1.0.2 by expanding the Custom Install menu selections and selecting all control panel items with the exception of PC Setup v.1.0.2. Refer to your User's Guide for instructions on using the Custom Install option.

Easy Install

An Easy Install of System 7.5 Update 1.0 does not install over the more current version of the PC Setup control panel that shipped with your system.

Article Change History:

23 Oct 1995 - Clarified Quadra 610 DOS Compatible information.

28 Sep 1995 - Added PC Setup 1.0.2 compatibility information.

TITLE

Extensions Manager: Extensions Off Compared To Shift
Down

Article ID: 17392
Created: 3/20/95
Modified: 3/30/99

TOPIC

Does using the Extension Manger "All Off" set do the same thing as holding down the Shift key at startup?

DISCUSSION

The Extensions Manager's All Off set and restarting while holding down the Shift key do not have the same effect. Each method "switches off" or "disables" some types of extensions that the other does not.

For example, the Extensions Manager switches off Chooser extensions while holding the Shift key down during restart does not. The Extensions Manager does not show or switch off most of the more esoteric extensions, such as System Updates, whereas the Shift down restart usually does.

In general, the Shift down restart usually switches off more extensions than the Extensions Manager. When you are trying to isolate an extension conflict and are not sure if it is an Apple System extension or a third party extension, restart while holding down the Shift key.

Few third party software items use extension types that the Extensions Manager does not recognize and turn off in the All Off set. The rare exception may be a monitor or other device driver. A Shift down restart usually does not disable these extensions either. Starting up from another volume (hard drive or floppy disk) or performing a clean install allows the bypassing of these types of extensions.

The Extensions Manager's All Off set and restarting while holding down the Shift key do not have the same effect. Each method "switches off" or "disables" some types of extensions that the other does not.

For example, the Extensions Manager switches off Chooser extensions while holding the Shift key down during restart does not. The Extensions Manager does not show or switch off most of the more esoteric extensions, such as System Updates, whereas the Shift down restart usually does.

In general, the Shift down restart usually switches off more extensions than the Extensions Manager. When you are trying to isolate an extension conflict and are not sure if it is an Apple System extension or a third party extension, restart while holding down the Shift key.

Few third party software items use extension types that the Extensions Manager does not recognize and turn off in the All Off set. The rare exception may be a monitor or other device driver. A Shift down restart usually does not disable these extensions either. Starting up from another volume (hard drive or floppy disk) or performing a clean install allows the bypassing of these types of extensions.

Macintosh IIci: System Update and Daystar Digital Compat. (3/95)

=====

Article Created: 21 March 1995

TOPIC -----

Are there any known issues with the DayStar Digital Turbo 601 and the System 7.5 Update 1.0?

DISCUSSION -----

A Macintosh IIci with the DayStar Digital Turbo 601 will not boot with the System 7.5 Update 1.0 installed if you are using a version earlier than 1.1 of the "Turbo 601" control panel.

Please contact DayStar Digital for an update.

Power Mac: Apple Guide Doesn't Work After System Update (10/95)

=====

Article Created: 21 March 1995
Article Reviewed/Updated: 20 October 1995

TOPIC -----

I have a Power Macintosh 7100/66. Since I installed the System 7.5 Update 1.0, I have not been able to get the Apple Guides to work.

I found that if I remove the Video Guide Additions and PowerBook Additions from the Extensions folder that the Guides work fine. What's wrong?

DISCUSSION -----

This is a known issue with AppleGuide 1.2.5, which is installed by System 7.5 Update 1.0, on Power Macintosh computers. Mixins installed for features that are not present in the computer (like AV Mixins installed on a machine which has no AV technology) will cause Apple Guide to "lose contact" with the Macintosh Guide and Tutorial files, thus causing all of the Guides to no longer work.

A "Mixin" is an Apple Guide content file that merges with the main Apple Guide file to add extra options. On any Macintosh computer running System 7.5 there is a standard Apple Guide file and there may also be another Apple Guide file added to the system depending on the features of that particular Macintosh computer. For example, there could be a file called Speech Guide Additions installed when you install Plaintalk. All of the Apple Guide files may stop working if the Speech Guide Additions file is present in the Extensions folder, but Plaintalk has been removed or is not installed.

The solution is to remove the extra unnecessary Mixins that do not belong on your Macintosh computer.

The only way to mistakenly install Mixins that are not needed by your computer is to do a Custom Install of the System 7.5 Update 1.0 for ANY Macintosh. An Easy Install or Custom Install for your particular Macintosh computer will not install unnecessary Mixins.

This issue is documented in the System 7.5 Update 1.0 Read Me file. The following text is an excerpt from that ReadMe file.

Problem with Guides on Some Power Macintosh Models

If you have a Power Macintosh and have trouble opening the Tutorial, Macintosh Guide, Shortcuts, or other Apple Guide databases, you may have extra files that don't belong on your computer. To solve the problem, follow the steps below:

Step 1

Open the Extensions folder (inside the System Folder) and drag the PowerBook Guide Additions file to the Trash.

Step 2

Unless your computer is an AV model, drag the following items to the Trash:

- Video Guide Additions
- Video Player Guide Additions
- Speech Guide Additions

Step 3

Choose Empty Trash from the Special menu.

Step 4

Restart your computer.

Other Guide Mixins from Apple or third party applications may prevent the Macintosh Guide from opening. In some cases, you may need to choose which Guide is more important to you and remove any extra guides which are causing the problem.

Article Change History:

20 Oct 1995 - Added additional information on third party guides.
06 Jul 1995 - Corrected typos.

DOS Compatibility Card: Adapter for Projection Equipment (3/95)

Revised: 5/24/95
Security: Everyone

DOS Compatibility Card: Adapter for Projection Equipment (3/95)

=====

Article Created: 21 March 1995

TOPIC -----

I am having problems getting the DOS Compatibility Card to sync properly to the projection equipment I am using. Is there a way to do this?

DISCUSSION -----

You can use the Sony MacView Cable Adapter (part # T-9985-647-1) to get the proper sync from both DOS and Windows. You need to use these settings on the MacView Cable Adapter:

Adapter Setting: M
Dip Switches: 1-6 OFF, 7-9 ON

The adapter can be purchased from Sony Service Parts at (800) 488-7669.

Apple IP Gateway: Incompatible with Some Ethernet Cards (3/95)

Revised: 3/21/95
Security: Everyone

Apple IP Gateway: Incompatible with Some Ethernet Cards (3/95)

=====

Article Created: 21 March 1995

TOPIC -----

Is the IP Gateway incompatible with some Ethernet cards?

DISCUSSION -----

Yes, the IP Gateway seems to be incompatible with some Ethernet cards. Whenever the IP Gateway software is invoked, some Ethernet cards may cause the computer on which it is installed to lock up. You must press the restart button to get the machine running again.

The Apple IP Gateway was tested with some third-party Ethernet cards (no list is available) but obviously not with all. If you are having difficulty with your particular Ethernet card, contact the vendor for your specific card.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

PowerBook 500 series: Audio Playthrough from External CD (3/95)

Revised: 3/22/95
Security: Everyone

PowerBook 500 series: Audio Playthrough from External CD (3/95)

=====

Article Created: 22 March 1995

TOPIC -----

I have a customer who wants to play audio CD's through his internal speakers. He has a PowerBook 500 series computer and a CD300 external drive. He has the audio cables connected to the sound input port. When he attempts to select the Play Through option as described in the Macintosh guide, he does not have that option available.

How can he play audio CDs through the internal speaker? I know that this is an option on AV units and Power Macintosh computers. Why can't he get this selection on the PowerBook 500 series?

DISCUSSION -----

The Audio playthrough option will appear in Macintosh models which have an internal CD player which has the audio input connected to the logic board of the Macintosh via an internal audio cable. This connector is a four prong connector which essentially supplies the same capability as the positive and negative terminal on standard home stereo speakers right and left channel.

The computer will acknowledge this audio connector being present and provide the option for playthrough in the Sound Control panel. The PowerBook 500 series does not provide a connection for audio on it's logic board (the microphone connector does not count, see below). Because of this, it cannot monitor an audio signal from an external audio connector.

An audio connection made to the microphone port on the PowerBook 500 is unable to be monitored by the speakers of the PowerBook 500, until the signal is digitized and then played back through the speakers.

All Macintosh computers with internal CD support have the internal audio connection which will allow the playback of audio CDs through the internal speaker.

Macintosh: About this Macintosh vs. Actual RAM Installed (4/95)

=====

Article Created: 13 April 1995

TOPIC -----

I have a Macintosh with 24MB of RAM installed but when I look in the About this Macintosh, it shows I have 24,576K installed. I don't have virtual memory enabled or RAM Doubler installed.

Where did the 576k of extra memory come from?

DISCUSSION -----

The discrepancy arises in the translation from base 2, which the computer uses, to base 10 which people use. In base 10 the easiest number to deal with divide easily by 10 such as 100, 1000, 10,000 etc. In base two the easiest number to deal with differ such as 128, 256, 1024 etc.

A thousand bytes, commonly called a kilobyte, is not exactly a 1000 bytes (base 10) but rather 1,024 bytes (base 2). Likewise a million bytes, commonly called a megabyte, is not 1000 kilobytes (base 10) but 1,024 kilobytes (base 2).

As the amount of RAM installed increases the differences between the two numbers compounds as the table below shows:

MB	=	Kilobytes
---		-----
1MB	=	1,024
2MB	=	2,048
3MB	=	3,096
...	=	...
16MB	=	16,384
20MB	=	20,480
24MB	=	24,576

Multiplying the number or megabytes of RAM installed by 1,024 gives the total kilobytes of RAM shown in the About this Macintosh window.

Power Macintosh: Oscillator Chip & Warranty Implications (5/95)

Revised: 5/9/95
Security: Everyone

Power Macintosh: Oscillator Chip & Warranty Implications (5/95)

Article Created: 22 March 1995
Article Reviewed/Updated: 9 May 1995

TOPIC -----

I have seen several advertisements for 'clock chipping' devices, sometimes referred to as "Clipper Chips", "Clock Boosters", or "Oscillator Chips" that will increase the speed of my Power Macintosh. Does Apple support the use of these products in its systems? Will they affect my Apple warranty?

DISCUSSION -----

Apple has tested its products under the conditions and environments that they were designed and intended to be used. Installing a clock accelerator device that increases the clock speed of the Power Macintosh may introduce conditions that the Power Macintosh was not designed and/or tested to handle. The results may be unpredictable or produce unreliable operation and may also cause damage to the computer.

Clock chipping devices make assumptions about the software and hardware of the systems that they are installed into. Due to slightly varying tolerances of individual components used inside the Power Macintosh, some of these assumptions prevent such a device from working properly.

In addition, installing an add-on device may present additional stresses on the Power Macintosh that may cause premature failure of certain components. There are also risks involved in the installation of a clock chipping device. As outlined in the Apple Limited Warranty included with Apple products, Apple's warranty "does not apply to damage caused by accident, abuse, misuse, misapplication, or service (including upgrades and expansions) performed by anyone who is not an Apple Authorized Service Provider; if the product has been modified without the written permission of Apple....." Any damage caused by the installation of such a device will not be covered under the Apple limited warranty.

QuickDraw GX: Installing Printing Extensions (3/95)

Revised: 3/22/95
Security: Everyone

QuickDraw GX: Installing Printing Extensions (3/95)

=====

Article Created: 22 March 1995

TOPIC -----

This article describes installing the QuickDraw GX printing extensions that come with System 7.5 CD-ROMs (both Personal and Multi-User Kits).

DISCUSSION -----

In order to use QuickDraw GX printing extensions you must have QuickDraw GX installed. If you are not using QuickDraw GX, you cannot use the printing extensions.

Peirce Software, Inc. in conjunction with Apple Computer, provides a free copy of Peirce Paper Saver and Peirce Watermark. Peirce Paper Saver and Peirce Watermark are QuickDraw GX printing extensions that enhance your printing capabilities when using QuickDraw GX printing and applications that support the new GX printing dialogs. Peirce Paper Saver allows you to print multiple pages on a single sheet of paper. You can print handouts or thumbnail printouts in configurations of 2, 3, 4, 6, 9, or 16 pages per printout, saving you paper and hassles when printing out handouts or proofing pages. Peirce Watermark lets you choose between six different text "Watermarks" to print in outline style on top of your pages.

Installations instructions
=====

Step 1

Drag the Peirce Paper Saver and Peirce Watermark files from the QuickDraw GX Extras folder on the System 7.5 CD to your system folder (or to the extensions folder inside your system folder).

Step 2

Restart your Macintosh.

Step 3

After doing this you will be able to use Peirce Paper Saver and Peirce Watermark with any applications that support the new QuickDraw GX printing dialogs (such as the Finder, SimpleText, and third party applications) by clicking on the "More Choices" button on the left side of the printing dialog to see the installed GX printing extensions. You will also be able to access additional instructions and information directly from the Peirce Paper Saver and Peirce Watermark dialogs by clicking on the "More Info" button.

For technical support on Peirce Paper Saver or Peirce Watermark call Peirce Software, Inc.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

LaserWriter 8.2: Read Me File (8/95)

Revised: 8/22/95
Security: Everyone

LaserWriter 8.2: Read Me File (8/95)

=====
Article Created: 22 March 1995
Article Review/Updated: 22 August 1995

TOPIC -----

This article contains the LaserWriter 8.2 Read Me file.

DISCUSSION -----

Information About LaserWriter 8 Printer Driver Version 8.2

This document contains some important reminders and some information that is not in the manual that comes with your printer. You may want to print this document and keep it for future reference.

The software on this disk includes version 8.2 of the Apple LaserWriter 8 printer driver, which works with many Apple LaserWriter printers. This document includes information about the software, as well as about several of the printers.

Installing the Printer Driver Software

The manual that comes with your printer contains detailed installation instructions. You cannot install the software by dragging their icons; you must use the Installer program as described in the printer manual.

Please note: before installing the printer software, you should restart your system with all Extensions turned off. To do this, hold down the Shift key while you restart your computer.

The Installer does not remove versions of the LaserWriter printer driver that are older than version 8.0. You may remove these files from your System Folder if you no longer need them.

The Installer does remove older versions of the LaserWriter 8 driver (for example, LaserWriter 8.0) and replaces the PPD files for Apple LaserWriter

printers with the latest versions.

When you choose Easy Install, the Installer places the following files in the System Folder on your hard disk. LaserWriter 8 is placed in the Extensions folder. The PPD files which are used by LaserWriter 8 are in a folder called Printer Descriptions also located in the Extensions folder. The Apple Printer Utility and LaserWriter Utility are placed in the System Folder.

Please note: if the Installer is unable to remove old files from your hard disk, it will terminate the installation procedure. If this happens, please remove old copies of the LaserWriter 8 driver and the PPD files. Run the installer again.

About PPD Files

The LaserWriter 8 driver uses PostScript Printer Description (PPD) files to determine the characteristics of the printers it uses. PPD files contain information about individual PostScript printers. For example, PPD files describe the paper-handling capabilities of printers: the number of paper trays, their capacity, and the paper sizes they handle.

To take full advantage of your printer's features, click the Setup button in the Chooser when selecting your printer for the first time, or after installing an additional option. This procedure causes the LaserWriter driver to query the printer for its characteristics and associate a particular PPD file with the printer.

About Creating EPS Files

You can create an Encapsulated PostScript (EPS) file in many application programs by clicking File in the Print dialog box, then clicking Save. When you create an EPS file, note the following:

- Creating EPS files with the All option selected in the Font Inclusion pop-up menu in the EPS dialog box can result in very large files. If you include all fonts in an EPS file and save the file with the Unlimited Downloadable Fonts option selected, an extremely large file may be created.
- If you create an EPS file with no fonts included and open the document, fonts in the document appear on your screen, but Courier may be substituted when you print.
- When you create EPS files with preview information included, other applications that create their own PostScript code may not display the EPS file accurately on the screen.

About the LaserWriter Utility and the Apple Printer Utility

Installing the LaserWriter 8 driver and printer software places the Apple Printer Utility program in your System Folder. The Apple Printer Utility program is designed to work with the LaserWriter 16/600 PS printer and succeeding releases of new printers.

To configure and work with previously released LaserWriter models, use the

LaserWriter Utility that came with your printer. The LaserWriter Utility is also provided on your printer software disks. You can install the LaserWriter Utility on your computer's hard disk by using the Custom install option of the Installer.

Using the LaserWriter 8 Driver With LaserWriter Printers

When using the LaserWriter 8 driver, you should be aware of the following situations. Some happen with all LaserWriter printers, and others happen only with specific models.

All LaserWriter Printers

- The LaserWriter 8 driver allows some printers to print using a larger imageable print area on the page. If your printer does so, you may find that text in some documents reflows or is clipped to fit the new imageable area. To maintain your document format when printing to different printer models, deselect the Larger Print Area option in the Page Setup Options dialog box.
- Some older printers with small amounts of memory will not print documents containing large numbers of fonts unless the Unlimited Downloadable Fonts option is selected in the Page Setup Options dialog box. If a document using multiple fonts doesn't print using the LaserWriter 8 driver, try selecting Unlimited Downloadable Fonts in the Page Setup Options dialog box and print again.
- Printing multiple documents with the Finder may not work if the documents have been created by different application programs.
- If you encounter a time-out (PostScript error -8993) when printing multiple copies of large and complex documents in the background, print the documents one at a time or select foreground printing to avoid this problem.

LaserWriter IIg and IIx

- When you select paper sources from the First From and Remaining From pop-up menus in the Print dialog box, selecting Manual Feed for either source sets the driver to print the first page from the manual feed tray.
- The US Legal paper size has been changed on some LaserWriter IIx/IIg printers to be more compatible with other Apple LaserWriter printers. If your legal-sized documents no longer fit on the page, select Larger Print Area in the Page Setup Options dialog box.
- Some form-printing applications cannot print forms using the Layout settings in the Page Setup dialog box.

LaserWriter IINT and IINTX

- If you select both the Smooth Graphics and the Invert Image options in the Page Setup Options dialog box, a PostScript error results.
- Do not use the B5 tray to print envelopes on a LaserWriter IINT. Use the letter tray instead.

LaserWriter Pro 600 and 630

- You cannot use Auto Select as the Paper Source in the Print dialog box to print envelopes from the optional envelope feeder.
- When you print at a resolution of 600 dots per inch (dpi), bitmapped images may appear with lines across the image.

LaserWriter Pro 810

- With some graphics applications, bitmapped graphics will be reduced by 25% in size when printed with the Precision Bitmap Alignment option in the Page Setup Options dialog box.
- When you create a PostScript file with a LaserWriter Pro 810 selected as the printer and send the file to a printer that uses PostScript Level 1, a PostScript error will occur.

LaserWriter 16/600 PS

- If Tray Switching is turned on and you have installed the optional 500-sheet feeder, and it contains the same paper size as the 250-sheet feeder, you should set up the driver to use the 500-sheet feeder as the preferred paper source for optimal printing performance. See Chapter 5 in the manual that came with your printer for instructions on selecting the 500-sheet feeder as the preferred paper source.

Using the LaserWriter 8 Driver With the Kanji System

To print Japanese characters using KanjiTalk or the Japanese Language Kit, your system must have WorldScript II version 7.1.1 or later.

Using the LaserWriter 8 Driver With Application Programs

Some application programs do not yet take advantage of the new features of the LaserWriter 8 driver or have small incompatibilities that result in printing problems. If you experience problems with a program, contact the publisher of the program. In some cases a newer version of the program may be available.

The following list describes some special cases that you should be aware of when working with some application programs. (There may be other problems with these programs, or with other programs, not mentioned in this document.)

- With many applications, you cannot use the Flip Horizontal, Flip Vertical, landscape page orientation, and Layout option in the Page Setup dialog box in combination.

Aldus Freehand 4.0

- Documents do not print correctly when you choose a page layout from the Layout pop-up menu in the Page Setup dialog box.

- EPS files created using the LaserWriter 8 driver from within Freehand cannot be used in other programs.

Aldus PageMaker 5.0

- Rotated graphics may not print correctly when you hold down the Option key and click Print in the Print dialog box.
- You cannot print legal-size documents from the paper cassette of the Personal LaserWriter 320; print such documents by selecting Manual Feed or by holding down the Option key and clicking Print in the Print dialog box.

Aldus SuperPaint 3.5

- Rotated or filled polygons print as solid gray objects.
- Gradient fills may not print when copied into other programs.

Canvas 3.5

- When you select the Substitute Fonts option in the Page Setup Options dialog box, text may be incorrectly spaced if fonts Geneva, New York or Monaco are used.

CricketDraw III 2.01

- When you choose a page layout from the Layout pop-up menu in the Page Setup dialog box, underlined TrueType fonts may not print.

CricketPresents 2.1

- You cannot import an EPS file created with the LaserWriter 8 driver when it has been saved without preview information.

FileMaker Pro 2.1

- When you choose a page layout from the Layout pop-up menu in the Page Setup dialog box, documents that contain EPS graphics may appear clipped when printed.

Informed Manager 1.4

- When you select the Unlimited Downloadable Fonts option, some graphic elements may shift or disappear when printed.

Lotus 1-2-3 1.1

- Text printed with the Outline or Shadow text style appears filled with gray.

MacDraft 3.01 and earlier versions

- When you print using the Cut Marks option, a PostScript error results.

Microsoft PowerPoint 3.0

- Polygons and ovals filled with gradients and without a border line may shift locations on the page when printed.

Microsoft Works 3.0

- Printing documents that have rotated objects with rounded corners results in a PostScript error.

Painter 2.0

- When you print using the Invert option, images do not print inverted correctly.

PixelPaint Pro 3.0

- When printing using the Invert option, images do not print inverted correctly.

QuarkXPress 3.3

- Be sure to use the PPDs provided with QuarkXPress when you choose a page layout from the Layout pop-up menu in the Page Setup dialog box.

RagTime 3.2

- You cannot print documents that contain PICT or TIFF files.

ReadySetGo! 6.0

- Use ReadySetGo! version 6.0 with the LaserWriter 8 printer driver; earlier versions will not work.
- You cannot print documents that use pen patterns.

Studio/8 & Studio/32

- When creating an EPS file with these programs and the LaserWriter 8 driver, you must select the QuickDraw Printer option.

WordPerfect 3.0

- When you select the Unlimited Downloadable Fonts option and print rotated text in Watermark, the entire document rotates when printed.

How to Get Updated Printer Software

If you need to update your printer software and you have an AppleLink account, you can obtain the latest versions of the LaserWriter 8 software from AppleLink.

Follow this path to locate the LaserWriter 8 software:

Apple Products

Apple Software Updates

Macintosh
Printing Software

The latest LaserWriter 8 software is also available from Apple's ftp site on the Internet. The path is:

/ftp/dts/mac/sys.soft/laserwriter.8.2.

System 7.5: Progress Bar and Welcome To Macintosh Screen (3/95)

Revised: 3/22/95
Security: Everyone

System 7.5: Progress Bar and Welcome To Macintosh Screen (3/95)

=====

Article Created: 22 March 1995

TOPIC -----

I have noticed that in System 7.5, when I invoke the Extensions Manager during startup, only the progress bar shows up and not the complete Welcome to Macintosh screen. The same thing happens if I have a StartUpScreen file in my system folder.

Does this indicate a problem?

DISCUSSION -----

System 7.5 Update 1.0 resolves the problems you described. We have verified that a 32 bit color StartUpScreen on a PowerBook 540c with System 7.5 Update 1.0 has the start up process displayed as expected.

also, when you invoke Extensions Manager at startup, there is no floating progress bar when the Extensions Manager window closes and the startup process is continued.

LaserWriter 16/600: Printing From UNIX, Troubleshooting (3/95)

Revised: 3/22/95
Security: Everyone

LaserWriter 16/600: Printing From UNIX, Troubleshooting (3/95)

=====

Article Created: 22 March 1995

TOPIC -----

The files I send to my LaserWriter 16/600 PS are not being printed, or they are not being printed correctly. How can I correct this?

DISCUSSION -----

The first thing to check is the LaserWriter setup. UNIX administrators know how to set up the /etc/printcap file, but they assume the printer does not need configuration for text.

The LaserWriter 16/600 PS defaults to PostScript as the TCP/IP mode, however, PostScript cannot handle text files. PCL5 handles text files, so the TCP/IP mode should to be changed to PCL5. If PostScript is also expected from this printer, choose AutoSelect. Here are the instructions:

Step 1

Move the configuration switch located above the Parallel port on the back of the printer to the up position.

Step 2

Launch the Apple Printer Utility.

Step 3

Open the Communication Configuration category.

Step 4

Open the Up Switch Position category (Custom)

Step 5

Set the TCP/IP mode to AutoSelect

Step 6

Press the Send button

Also check the `/etc/printcap` file. Follow the example on page 125 of the "Apple LaserWriter 16/600 PS: Setting Up, Connecting, and Using Your Printer" manual that came with your LaserWriter 16/600 PS. More specifically, check the type to which "rp" is set. If "rp=text" and the printer is not working correctly, try "rp=raw", or visa-versa.

More in-depth information on setting up the `/etc/printcap` file can be found in the Tech Info Library article "LaserWriter 16/600 PS & Sun Solaris Through TCP/IP".

PowerTalk Direct Dialup Read Me (3/95)

Revised: 3/22/95
Security: Everyone

PowerTalk Direct Dialup Read Me (3/95)

=====

Article Created: 21 March 1995

TOPIC -----

This article is the PowerTalk Direct Dialup Read Me.

DISCUSSION -----

PowerTalk Direct Dialup Mail allows you to send mail between two computers connected via modem. For instructions on the use of PowerTalk Direct Dialup Mail, please refer to the "PowerTalk User's Guide." To use Direct Dialup mail, you need to have PowerTalk and Direct Dialup mail installed and a modem connected to your Macintosh or PowerBook.

Installation and Compatibility

Apple Remote Access (ARA) 1.0 is not compatible with Direct Dialup mail. It is automatically removed from your hard disk when you install Direct Dialup mail. To use ARA with Direct Dialup mail, you must upgrade to Apple Remote Access version 2.0 or later.

ARA MultiPort Server is not compatible with Direct Dialup mail. Do not install both ARA Multiport Server and Direct Dialup mail on the same computer.

- 640 by 480 pixels (for both high- and standard-quality)

Optics

- Fixed-focus lens
- Lens Field of view: 8 mm (equivalent to 50-mm lens on a 35-mm camera).
- ISO: equivalent to approximately ISO 85
- Focus range: 4 feet to infinity
- Focus range with closeup lens: 10-14 inches
- Aperture from f2.8 to f16
- Optical viewfinder

Speed

- Shutter speed: from 1/30 to 1/175 of a second
- Cycle time: average 4 seconds
- Self-timer: 10 seconds

Built-in Flash

- Three modes: Automatic, On, or Off
- Range 4 to 9 feet
- Range with close-up lens: 10-14 inches
- Flash cycle time: 7 seconds

Power

- Includes three AA lithium batteries
- Supports three 1.5 V AA, R6P, LR-6, or SUM-3 NiCad or lithium batteries
- Optional AC adapter (use only the QuickTake AC adapter M2851LL/A or the Macintosh PowerBook AC Adapter M4662LL/A)
- Optional QuickTake Batter Booster Pack (M265G/A)

Note:

1.5 V Alkaline batteries are NOT compatible with the QuickTake 150 camera and can damage the camera if used.

Interface

- Serial port supporting connections to a Macintosh and PC-Compatible:
 - RS-422 serial for the Macintosh printer or modem port
 - RS-232C serial for the PC-compatible serial port (COM1-COM4)

User Controls

- Shutter release, resolution, flash, self-timer, and Erase All Images

LCD Status Window

- Number of images that have been taken
- Number of images remaining
- Resolution, flash, and self-timer settings
- Erase All Images
- Battery level

Operating Environment

- Operating - 0 to 40 deg. C (32 to 104 deg. F)
- Storage (6 months) - -40 to 47 deg. C (-40 to 117 deg. F)
- Transit (72 hours) - -40 to 65 deg. C (-40 to 149 deg. F)
- Humidity - 20 to 95 percent, non-condensing
- Altitude - No limitation other than specified temperature and humidity limits

System Requirements

=====

Macintosh

- A Macintosh with a 68020 or higher central processing unit (any Macintosh except a Macintosh Plus, SE, Classic, Portable, or Powerbook 100)
- System software version 7.1 or a later version
- If you have system software version 7.1 or 7.1.2, it is recommended that you have at least 4 MB of RAM with 8 MB of virtual memory or 8 MB of RAM.
- If you have system software version 7.5, it is recommended that you have at least 8 MB of RAM.
- Hard drive with at least 10 MB available

Windows

- An IBM or IBM-compatible personal computer with an 80386 or later processor
- Windows version 3.1, 3.1.1 for WorkGroups, or Windows NT 3.5
- MS-DOS 3.3 or later
- 2 MB of available RAM
- 3.5-inch, 1.44 MB floppy disk drive
- A hard drive with at least 10 MB available

QuickTake 150 Contents

QuickTake 150 camera
Closeup lens
Macintosh serial cable
Neck strap
Batteries
QuickTake software

QuickTake 150 Accessories

QuickTake Travel Case (M2848G/A)
QuickTake Battery Booster Pack (M2655G/A)
QuickTake AC Adapter (M2851LL/A)
QuickTake Connection Kit for Windows (M3793LL/A)

Article Change History:

17 Sep 1996 - Minor typographical correction.

QuickDraw 3D: Questions and Answers (3/95)

Revised: 3/22/95
Security: Everyone

QuickDraw 3D: Questions and Answers (3/95)

Article Created: 22 March 1995

TOPIC -----

This article provides questions and answers about QuickDraw 3D.

DISCUSSION -----

Question: What are you announcing?

Answer: The February announcement is a technology announcement with regards to QuickDraw 3D and Apple's new 3D metafile format (3DMF)

Question: What is QuickDraw 3D?

Answer: QuickDraw 3D is a system extension for creating, manipulating, rendering, and sharing 3D graphics. It consists of human interface guidelines and toolkit, a 3D file format, a high-level geometry engine, a shading and rendering architecture, and a device and acceleration manager for hardware acceleration.

Question: Why is Apple doing 3D?

Answer: The addition of 3D graphics technologies to the platform will enable Apple to extend its lead in the markets where we are currently strong, including publishing, multimedia authoring, and education, by providing these customers with next-generation 3D solutions. It will also make Apple even more competitive in the technical markets as well as in the rapid growing consumer markets, where games and entertainment are all using 3D graphics.

Question: When will it be available?

Answer: Apple expects to ship the software this summer.

Question: How will it be distributed?

Answer: QuickDraw 3D will be licensed to developers for shipment with their applications, shipped on the hard disk of new Power Macintosh computers, and integrated into the next major system software release, Copland.

Question: What about 680x0 Macintosh computers?

Answer: QuickDraw 3D is the first new software designed to take advantage of the PowerPC chip, and as such is not designed to run on 68K machines. However, the file format is designed for ANY platform; therefore, 68K-based applications will be able to read and write 3D data—they will display and manipulate the data with their own software, as they do today.

Question: Will it be cross-platform?

Answer: Yes. Apple has made the commitment to release a Windows version QuickDraw 3D roughly six months after the release of QuickDraw 3D 1.0 for versions of MacOS running on PowerPC.

Question: What are developers saying about it?

Answer: To date, developer support has been outstanding. Both major hardware and software developers are announcing support to the technology. QuickDraw 3D has also attracted some new players to the MacOS running on the Power Macintosh platform.

Question: What is the minimum configuration?

Answer: The minimum configuration is:

- A PowerPC processor
- Macintosh System 7.1.2 (or later)
- A hard drive
- 16MB of DRAM

Question: Will QuickDraw 3D support OpenDoc?

Answer: Yes. If a developer decides to make a 3D part with QuickDraw 3D, then any OpenDoc container will get 3D functionality without further modification!

Question: What is the difference between QuickDraw 3D and QuickTime VR?

Answer: QuickDraw 3D helps developers in the creation and rendering of synthetic 3D graphics. QuickTime VR is a very sophisticated playback engine that enables developers to stitch together either photographs or pre-rendered 3D scenes so

that they can be "navigated" interactively.

Question: How does QuickDraw 3D compare to OpenGL?

Answer: The QuickDraw 3D API addresses the needs of developers and customers by providing user interface guidelines, a high-level geometry engine, an extensible shading and rendering architecture, and a file format. OpenGL provides support for low-level geometry and rendering.

Apple Education Series: Early Versions Require Password (12/95)

Revised: 12/20/95
Security: Everyone

Apple Education Series: Early Versions Require Password (12/95)

=====

Article Created: 22 March 1995
Article Reviewed/Updated: 20 December 1995

TOPIC -----

I cannot seem to reinstall my Apple Early Childhood Connections software without a password. I do not remember the password and it does not seem to be published anywhere. Where can I get it?

DISCUSSION -----

Early versions of Apple Education Series bundles required a password for reinstalling the software from the backup CD-ROM discs.

These bundles include:

- The Apple Early Language Connections bundle
- The Apple Early Childhood Connections bundle
- The Biology Bundle

You can call the Education Support Group at the Apple Assistance Center (800-SOS-APPL). They will provide the password for the time frame during which the bundle was purchased. Due to security reasons, Apple does not publish these passwords.

Beginning in October 1995, the following software bundles were no longer pre-installed on your hard drive and shipped on CD-ROM disc only. Versions of these bundles released after October 1995 can be installed or reinstalled without a password:

- The Apple Early Language Connections bundle
- The Apple Early Childhood Connections bundle
- The Apple Spanish Language Connections bundle

Article Change History:

20 Dec 1995 - Updated support group's official name.

28 Nov 1995 - Updated which bundles require password.

QuickDraw GX 1.1.1: System Crashes at Finder Launch (3/95)

Revised: 3/22/95
Security: Everyone

QuickDraw GX 1.1.1: System Crashes at Finder Launch (3/95)

=====

Article Created: 22 March 1995

TOPIC -----

I am experiencing a consistant crash at the Finder launch after installing QuickDraw GX 1.1.1. I have tried removing all of my extensions and nothing has changed.

DISCUSSION -----

Start up with Shift key held down. Then remove the Finder Preferences file from the System Folder's Preferences folder.

If you have and know how to use ResEdit or a similar editing program you can just remove all 'sgci' resources from a copy of the Finder Preferences file and replace it. This latter approach preserves all other Finder preferences.

WARNING:

The instructions in this article refer to using ResEdit to alter your system software. Apple Computer, Inc., is not liable for any damage done to your software through the use of ResEdit to alter the software. The User Assistance Center phone representatives (at 800-SOS-APPL) do not provide technical support for ResEdit. It is supported by APDA. For contact information on APDA, search the Tech Info Library under "APDA".

Blind Dialing Problem With Express Modem II v1.5.4 (3/95)

Revised: 3/22/95
Security: Everyone

Blind Dialing Problem With Express Modem II v1.5.4 (3/95)

=====

Article Created: 22 March 1995

TOPIC -----

I have a problem concerning the blind dialing capability of the Express Modem (version 1.5.4). When I check the box "without dial tone detection," the modem does not dial. Instead a dialog box appears in the screen saying that modem could not acquire dial tone.

This problem appears only in the PowerBook 500 Series (520 and 540c tested). Also we believe that the problem appears only in the European modem version because we have tested it in the U.S. and the European modem was (Express Modem II) working properly.

Could you please tell me if there is any possible workaround for this?

DISCUSSION -----

The problem you are experiencing is not tied to a specific Express Modem hardware. It depends on what country settings you are currently using with your Express Modem software. On a PowerBook 200 Series (Duo) the country settings are controlled by an external DAA country code. On a PowerBook 500 Series with Express Modem II the System software country code controls the settings.

There are countries like France and Spain where PTT protocols do not allow blind dialing. Hence, the atx3 command or EM CDEV checkbox have no effect in these countries. If you are using Express Modem v1.5.4, only the ';d' "hack" works to enable blind dialing in this situation.

In next release of the Express Modem software (v2.0) the checkbox will not be displayed when you are in a country where the feature is not allowed.

Workaround

Put ;d in the Dial Prefix box or as the first two characters of the phone number (for example, ;d5551212). This will force the modem to blind dial.

PowerBook: Text to Speech from PlainTalk (3/95)

Revised: 3/23/95
Security: Everyone

PowerBook: Text to Speech from PlainTalk (3/95)

=====

Article Created: 23 March 1995

TOPIC -----

I used to be able to have my PowerBook read files out loud using SimpleText, but now the Sound menu items are dimmed. I've reinstalled the System software but SimpleText won't talk anymore.

What file is missing and how do I get it installed?

DISCUSSION -----

The PlainTalk Product consists of two parts. Part one is related to speech input and only functions on Quadra AV models and Power Macintosh computers. Part two is related to speech output and is referred to as TTS or Text-to-Speech.

Text-to-Speech is currently shipping with PowerBook 200 & 500 models. It can be acquired from an Apple Software updates site and installed on any PowerBook, though.

The TTS software is included in the Extras / Apple Extras folder. A minimum installation is just the Speech Manager extension which supplies the built-in "Fred" voice. If more voices are desired and the machine has enough memory to support them, then the MacinTalk Pro extension and the Voices folder can be copied to the Extensions folder for additional voices.

Power Macintosh 6100 DOS Compatible Card: Memory Map (3/95)

Revised: 3/23/95
Security: Everyone

Power Macintosh 6100 DOS Compatible Card: Memory Map (3/95)

=====

Article Created: 23 March 1995

TOPIC -----

Is it possible to get a memory map of the DOS Compatibility Card for the Power Macintosh 6100? Many of the conventional memory monitors don't work, so it would be useful to understand how things are mapped.

DISCUSSION -----

Here's what the DOS Card memory map looks like.

	Address	Address	Address

Composite/S-Video: Maximum Cable Length (3/95)

Revised: 3/23/95
Security: Everyone

Composite/S-Video: Maximum Cable Length (3/95)

Article Created: 23 March 1995

TOPIC -----

I have a customer who wants to use the Apple Presentation System in their school. They want to wire the building for S-Video. Is there a maximum S-Video cable length restriction for the Apple Presentation System, from the box to the video monitor?

DISCUSSION -----

Generally speaking, the video industry has not defined limits for the maximum length of composite or S-video cables (whether they are attached to the Apple Presentation System, or any other video source, like a VCR).

Composite and S-video cables carry an analog video signal. Due to the characteristics of these signals, they can travel over much longer cables, with much less degradation, than, for example, digital data on a Macintosh SCSI bus.

As longer cables are used, an analog video signal will become weaker and have less quality. How weak the signal gets depends on the quality of the cable. If the customer connected a 500-foot cable to the Apple Presentation System, a weak video signal may still be visible on the attached video monitor.

Since digital signals cannot usually afford to "lose" data due to low quality, the cables must have a specified maximum cable length, over which 100% of the data is guaranteed to travel. This is why there are cable length specifications for technologies like SCSI, ADB, and LocalTalk.

Here's the bottom line:

Although we are not aware of a length specification for this kind of cable, it is probably a good idea to use cables that are shorter than about 50 feet. However, it's possible to use high quality cables that are 100 feet, or longer, without a perceptible loss in signal quality. The customer will see the "best" performance when using the shortest cables.

If your customer finds that they are unable to get a high quality video signal using longer cables, they could also consider using a video distribution amplifier. Video distribution amplifiers take an incoming video signal, such as from the Apple Presentation System, and boost it, so that it can travel over greater distances. These devices are usually available from high-quality video equipment dealers.

Apple Adjustable Keyboard: Caps Lock with Microsoft Apps (3/95)

Revised: 3/23/95
Security: Everyone

Apple Adjustable Keyboard: Caps Lock with Microsoft Apps (3/95)

=====

Article Created: 23 March 1995

TOPIC -----

I am using the Apple Adjustable Keyboard with Caps Lock active. I launch Microsoft Word and halfway thru launching, the LED indicating that Caps Lock is active goes off.

The keyboard remains in Caps Lock although the LED is off. If I press the Caps Lock key again, the LED comes on and Caps Lock is still active. If you press Caps Lock again, it will go to lowercase and the LED turns off.

Is there a fix to this problem?

DISCUSSION -----

This problem only seems to occur with the Apple Adjustable Keyboard and Microsoft Word 6.0, Excel 4.0, and Excel 5.0. It does not occur with Word 5.1a.

Microsoft Technical Support stated that the problem with the Caps Lock on the Apple Adjustable Keyboard has not been addressed at this time. The upcoming Microsoft Word and Excel maintenance releases do not fix this problem.

Microsoft Technical Support added that they expect to resolve this problem in a future release of their software.

QuickTake 2.0 Software: List of Files Installed (3/95)

Revised: 3/23/95
Security: Everyone

QuickTake 2.0 Software: List of Files Installed (3/95)

=====

Article Created: 23 March 1995

TOPIC -----

What are the different files installed by the QuickTake 2.0 software?

DISCUSSION -----

The QuickTake 2.0 software installs two main sets of files.

First, it installs the PhotoFlash 2.0 application software, which is now used to access and manipulate the images stored in a QuickTake camera. PhotoFlash is now used instead of the QuickTake application, which came with version 1.0 of the QuickTake software.

Second, the QuickTake installer also puts several files in the System Folder. Here is a brief explanation of those system files:

- ColorSync 1.0.5 (system extension) -- The ColorSync software is used to get the best quality color output from your QuickTake digital camera.
- ColorSync System Profile 1.0.5 (control panel) -- This file is used to choose the ColorSync System Profile that matches the main monitor to which the Macintosh is attached.
- Foreign File Access 5.0 (system extension) -- This file is used for mounting non-Macintosh volumes in the Finder. It is used with the "QuickTake Access" file to read images from the QuickTake camera.
- GeoPort Serial Driver 2.0 (Shared Library Manager document) -- This file contains the serial driver needed for the Macintosh to communicate with the QuickTake digital camera.
- PhotoFlash Camera Utilities 2.0.1 (AppleScript scripting addition) -- This file contains QuickTake Scripting Additions used by PhotoFlash scripts for accessing a QuickTake digital camera.

- QuickTake Access 2.0 (Foreign File Access document) -- This file works with Foreign File Access to access the QuickTake camera as a volume on the desktop, just like an AppleShare volume. This file gives Foreign File Access the necessary information to access the camera as a regular Macintosh volume.
- QuickTake Camera 2.0 (system extension) -- This file contains the driver needed for your Macintosh to communicate with the camera.
- QuickTake Image 2.0.1 (system extension) -- This file contains the QuickTime decompressor component for viewing QuickTake images.
- QuickTake Image Access 2.0 (control panel) -- This file makes it possible to mount the camera on your desktop.
- QuickTime 2.0 (system extension) -- This file contains the software necessary for decompressing QuickTake images with the QuickTake Image extension.
- Serial Extension 2.2 (Shared Library Manager document) -- This file contains additional serial port configuration information, so that the Macintosh can communicate with the QuickTake digital camera.
- Shared Library Manager 1.1.2 (system extension) -- This file is used to load the GeoPort Serial Driver and Serial Extension files.

Extension Versions Inconsistent After Update (4/95)

Revised: 4/7/95
Security: Everyone

Extension Versions Inconsistent After Update (4/95)

=====

Article Created: 23 March 1995
Article Reviewed/Updated: 7 April 1995

TOPIC -----

Users who have updated their operating system with Network Software Installer 1.5 or System 7.5 Update 1.0 may have versions of extensions and control panels inconsistent with the installed update.

DISCUSSION -----

One likely cause can be that disabled extensions and control panels are NOT being updated. The installer does not look for extensions or control panels in unusual locations like the Extensions (Disabled) or Control Panels (Disabled) folders. Users who use Extension Manager or similar third-party software should complete the following steps to ensure a proper and complete update when running the installer:

Step 1

Turn all extensions and control panels ON with the Extension Manager control panel.

Step 2

Restart and hold the shift key down to keep extensions from loading. Even though extensions do not load into RAM during startup, they reside in the Extensions folder where the installer can find them.

Step 3

Run the update installer.

AppleSearch 1.5 and Searches with Wildcards (11/95)

Revised: 1/4/96
Security: Everyone

AppleSearch 1.5 and Searches with Wildcards (11/95)

=====

Article Created: 24 March 1995
Article Rewviewed/Updated: 20 November 1995

TOPIC -----

We have an issue with AppleSearch using wildcards. We are attempting to put our HR records into AppleSearch. We have noticed a number of occurrences of wildcards not working very well. One glaring example is the variations of the word manage. For example, management will not be found with any wildcards except for managemen*, and even then does not find many of the hits that using management will find. What am I doing wrong?

DISCUSSION -----

At the heart of this issue is the stemming technique used by AppleSearch for search strings. When you enter a wildcard string, you expect AppleSearch to use the entire string, as entered, and the wildcard to find matches. Unfortunately AppleSearch does not do this. It first stems the string and then places the wildcard. It then uses this string to search the index, where the index is composed of stemmed references to document text. This is how a search for "representing" can find such words like represent, represents, and representative. AppleSearch stems representing to "repres", as do the words represent, represents, and representative. In essence, AppleSearch believes these words are the same, because its index only contains the stemming results, not the whole string.

Unfortunately, stemming is not always a predictable science. From your example, we will use the manage* string. Stemming of this string produces "manage*". However, many of the words desired by the search (such as management, manager, managing, and so on) stem to manag, which is why many of the expected hits are not returned.

Here is a general guideline that should be useful for users that are having problems with search strings:

In general, wildcards are not necessary for AppleSearch queries as stemming

provides the same results. When wildcards are unavoidable, try to make the provided information as small as possible, usually four or five characters maximum.

System 7.5: PageMaker Can't Place From Scrapbook Files (3/95)

Revised: 3/23/95
Security: Everyone

System 7.5: PageMaker Can't Place From Scrapbook Files (3/95)

=====

Article Created: 23 March 1995

TOPIC -----

I have a customer who was running PageMaker 5.0 on a Macintosh Centris 610 running System Software 7.1. One of the features of PageMaker is its ability to open the scrapbook file in the System Folder thereby allowing the user to place PICT and TEXT files one at a time from the scrapbook file. Under System 7.1 this PageMaker feature was working fine.

The customer has just upgraded to a Power Macintosh 8100/100AV running System Software 7.5. Now when they choose the Place command, they can no longer see the scrapbook file in the System Folder.

Why is this happening? What can this customer do to get this functionality back?

DISCUSSION -----

Problem Description

Scrapbook versions 7.0 through 7.1.2 are Desk Accessories that look for a scrapbook file of type 'scbk' in the System Folder. With the introduction of System Software 7.5, a new version of the Scrapbook is included. Scrapbook version 7.5 is now an application (instead of a DA) which looks for a scrapbook file of type 'sbkt'. New features of the Scrapbook 7.5 application include:

- A Growable/resizable window
- Application is now Drag and Drop Aware
- Gives more information about data types

PageMaker 5.0 only knows how to open the older type of scrapbook files: 'scbk'. It has not yet been updated to open the newer type of scrapbook files: 'sbkt'. PageMaker will need to be updated by Adobe/Aldus to support this new file type.

The Power Macintosh 8100/100AV ships standard with System Software 7.5 and the

new Scrapbook application. This Macintosh will not run on any operating system other than System Software 7.5. This explains why this particular user is unable to open their scrapbook file.

Workaround

Until Adobe/Aldus updates PageMaker, a solution is to change the file type of the new scrapbook file to 'scbk'. This can be done fairly easily with ResEdit or some shareware applications like File Buddy and Drop•GetInfo. After changing the file type of the Scrapbook file, PageMaker should be able to open it just as it would the older type of file.

NOTE:

If the user launches the Scrapbook application and the scrapbook file is in the System Folder, the Scrapbook application will automatically update the file and creator type to the newer type. In other words, if the customer is going to alter the scrapbook file as suggested in the workaround above, they should not keep the scrapbook file in the System Folder because the next time they open the application the file type will change back to the new file type.

WARNING:

The instructions in this article refer to using ResEdit to alter your software. Apple Computer, Inc., is not liable for any damage done to your software through the use of ResEdit. The User Assistance Center phone representatives (at 800-SOS-APPL) do not provide technical support for ResEdit. It is supported by APDA. System 7.5 Update 1.0 Install: Lose Fax LW Driver (3/95)

Revised: 3/24/95
Security: Everyone

System 7.5 Update 1.0 Install: Lose Fax LW Driver (3/95)

=====

Article Created: 24 March 1995

TOPIC -----

I just installed the System 7.5 Update 1.0, and lost the capability to access the Fax phone book through the LaserWriter (LW) 8.2 driver.

Where is the Fax phone book capability? Was the functionality removed?

DISCUSSION -----

System 7.5 Update 1.0 contains the "generic" LaserWriter 8.2 driver not a fax version. This driver does enable you to fax documents if you have the proper PPD for your PostScript fax equipped printer, you do not have access to the Fax Phone Book and, therefore, cannot store multiple fax destinations. The 8.2 driver will remember the last phone number you Faxed to, but if you wish to fax to a different destination, you will need to enter that phone number.

To gain access to the Fax Phone Book, you will need to use the fax LaserWriter driver that came with your printer, such as 8.1.2f or the newer 8.2f.

PowerBook 280c: Global Village Power Up Issue (5/96)

Revised: 5/30/96
Security: Everyone

PowerBook 280c: Global Village Power Up Issue (5/96)

=====

Article Created: 27 March 1995
Article Reviewed/Updated: 30 May 1996

TOPIC -----

The PowerBook Duo 280 and 280c have seen intermittent power up problems with Global Village PowerPort Mercury modems installed. Affected units have a problem starting up on battery power. Most cases also have a large memory card installed.

DISCUSSION -----

Global Village recommends loading their modem software before installing their modem. You may need to start up using AC power the first time after installing the modem, but after that first startup, things should work fine. Here are the recommended steps to correctly install the modem.

Step 1

Make sure all Express Modem software has been removed (if applicable).

Step 2

Install Global Village modem software (v 2.08a or 2.5) BEFORE installing the modem.

Step 3

Shutdown the PowerBook Duo and install the Global Village Mercury modem following the installation instructions provided by Global Village.

Step 4

Start up the PowerBook Duo with AC adapter plugged in or in Duo Dock. You may have to try the back button two or three times to get the machine to start up. When the PowerBook has completed the startup process, the Global Village

extension downloads new power management code to correct the problem.

If you have a PowerBook with the modem installed already, Step 2 and 4 above can be done with the same end result. The only problem is getting the unit to startup to load the modem software from disk, and then rebooting again to download the new power management software. The main reason to load the modem software first, is to avoid the symptoms associated with trying to get the unit to startup with Global Village modem and no Global Village software installed.

Other possible workarounds include:

- Reset the power manager by holding these keys down while starting up: Command-Escape-d. This power manager@ similar to pressing the power button in the back of the computer for 30 seconds.
- Reset the power manager by holding these keys down while starting up: Command-Option-front power on key. This power manager reset is similar to disconnecting the internal backup battery of the computer.
- Install an Apple Express Modem.
- Replace the large RAM card with an Apple 8 MB RAM card.

Revised: 3/27/95
Security: Everyone

MAE 2.0: KeyAccess Is Compatible (3/95)

=====

Article Created: 27 March 1995

TOPIC -----

Is KeyAccess compatible with MAE 2.0?

Can I hold the shift key down while launching MAE and get the same result (all extensions off) as holding the shift key down while restarting a Macintosh computer?

DISCUSSION -----

Yes, MAE 2.0 is compatible with KeyAccess which lets users access applications on a KeyServer.

No, holding the shift key down does NOT disable extensions while launching MAE. An alternative is to use either the -noextensions option on the mae command line, or the Extensions Manager in MAE 2.0 which turns extensions on or off.

DOS Compatibility Card: Two-Button Mouse Available (3/95)

Revised: 5/24/95
Security: Everyone

DOS Compatibility Card: Two-Button Mouse Available (3/95)

=====

Article Created: 27 March 1995
Article Reviewed/Updated: 30 March 1995

TOPIC -----

Are there any two-button mouse devices available for the DOS Compatibility Card that work in both the Mac OS and Windows?

DISCUSSION -----

There are several ADB multi-button mouse devices available for the Macintosh that support the DOS Compatibility Card. Logitech offers a three button version, while Kensington offers the Turbo Mouse and a new model called Thinking Mouse which is a 4 button mouse.

Both of the Logitech three button mouse and the Kensington Turbo Mouse have been tested and work with the DOS Compatibility Card. Each of these mouse devices use a control panel to map the button functions, so to use these with the DOS Compatibility Card, you need to set up the right button to represent '=' in the control panel. The configuration changes when the Control Panel is closed.

The Thinking Mouse product literature says it works with PC and Macintosh. The Control Panel appears to provide more options than other multi-button mouse devices, however it has not been tested with the DOS Compatibility Card.

Apple MultiMedia Tuner: What it does and what it fixes (3/95)

Revised: 3/27/95
Security: Everyone

Apple MultiMedia Tuner: What it does and what it fixes (3/95)

=====

Article Created: 27 March 1995

TOPIC -----

This article describes the Apple Multimedia Tuner extension and what it does.

DISCUSSION -----

Apple Multimedia Tuner 2.0.1

What is the Apple Multimedia Tuner?

=====

The Apple Multimedia Tuner system extension includes a set of software enhancements that improve the performance and reliability of some software applications and multimedia titles that utilize QuickTime 2.0 and Sound Manager 3.0 software.

System software compatibility

The Tuner is compatible with all system software versions from System 6.0.7 through System 7.5.

Hardware compatibility

The Tuner is compatible across all CPU families that support QuickTime.

Specific problems addressed by the Apple Multimedia Tuner

=====

Provided workaround for incorrect movie pre-rolling by some applications

Several applications and titles, most notably titles created using Macromedia's Director, have not been properly pre-rolling movies to prepare them for playback. This resulted in jerky movie playback. Prior versions of QuickTime

were tolerant of this application bug; however, QuickTime 2.0 with its higher performance requires that movies be pre-rolled. The Tuner will help these applications by automatically pre-rolling movies under many situations.

Fixed some performance problems that resulted in "jerky" movie playback

Under low-memory conditions, some parts of the movie toolbox were not managing memory efficiently and movie playback performance was degraded. These problems were showing up in Adobe Premiere 4.0.x..

Fixed DrawPicture problem on 68K systems

Fixed problem in DrawPicture where qdErr was not being cleared in all cases. The Tuner patches DrawPicture to ensure that qdErr is always cleared on entry. This patch is only installed on 68K CPUs.

DSP Manager problem on 660AV & 840AV systems

The DSP Manager calls the Memory Manager from interrupt level. This is completely illegal to do and was causing some memory mgr errors to be lost. The Tuner patches the DSP Manager to detect and avoid this situation. Problem was originally driven by Adobe Premiere 4.0.x.

Fixed problem where some images were not being decompressed

Fixed a problem (originally driven by the New Grolier Multimedia Encyclopedia) that resulted in some compressed images not being decompressed due to a bug in the Image Compression Manager. The problem resulted in blank pictures instead of the desired image.

Unable to open Sound Channels in some "low-memory" situations

Several developers reported problems being able to open Sound Channels under certain memory conditions (mainly when there was very little System Heap available). The Tuner installs code that helps the Sound Manager find the needed memory by attempting to allocate out of the application heap.

Fixed flatten movie problem

Flattening certain types of movies would result in movies that had garbled video tracks.

Sound "break-up" problems fixed

Fixed some performance problems that were causing sound drop outs in certain situations.

Fixed problem decompressing some types of pictures

Some types of images were garbled when decompressed.

Other Problems fixed

Fixed problem importing some types of picture files

Fixed problem saving looped movies

Fixed problem with garbled movie preview displays

Fixed problem sending QuickTime movies in AppleMail

Apple Multimedia Kit for PC: No Speed Switch in DOS (9/95)

Revised: 9/7/95
Security: Everyone

Apple Multimedia Kit for PC: No Speed Switch in DOS (9/95)

=====
Article Created: 27 March 1995
Article Reviewed/Updated: 7 September 1995

TOPIC -----

The Macintosh Apple CD-ROM Setup control panel allows you to switch the AppleCD 300 CD-ROM drive to either double or single speed. How can I do this under MS-DOS?

DISCUSSION -----

Only version 4.x.x of the Apple CD-ROM Setup software was there a speed switch for switching between single and double speed drives. This control panel was discontinued in CD-ROM Setup software versions 5.0 and beyond because engineering found that it was unnecessary.

The speed switch was never a feature of the Windows CD-ROM software driver.

Apple 350 MB Hard Disks: Buzz Sound Normal (4/95)

Revised: 4/7/95
Security: Everyone

Apple 350 MB Hard Disks: Buzz Sound Normal (4/95)

=====

Article Created: 27 March 1995
Article Reviewed/Updated: 7 April 1995

TOPIC -----

Periodically the hard disk in my Macintosh Performa 6115CD makes a buzzing sound. The hard drive is a 350 MB drive. Is this drive defective?

DISCUSSION -----

If you have a Macintosh computer with a 350, 500, or 700 MB hard drive, you may find that the drive periodically makes a buzzing sound. There is nothing wrong with the drive. The 350 MB drives have a feature that performs a small set of seeks after 10 minutes of idle spinning activity. This is done to increase the reliability of the drive by preventing heads from staying on a single track for a prolonged period. These seeks help to avoid accelerated wear; flying characteristics change due to debris buildup on the head or lubrication being affected. You may hear a brief buzz sound when this seek activity happens. It does not affect the drive's ability to respond quickly to host requests during that period.

Data integrity and system operation are NOT compromised by this activity, and there is no reason to replace the hard disk because of the buzzing sound.

The same mechanism is utilized in 500 MB and 700 MB 3.5-in. SCSI drives, so this feature is also included on these hard disks.

LaserWriter Select 310: Legal Paper Requires RAM Upgrade (3/95)

Revised: 3/27/95
Security: Everyone

LaserWriter Select 310: Legal Paper Requires RAM Upgrade (3/95)

Article Created: 27 March 1995

TOPIC -----

I am trying to print a legal size page on my LaserWriter Select 310 using the multi-purpose tray, but the bottom three inches of the page are always blank. It looks like the printer is printing only on a letter size page. What is required to print on legal paper?

DISCUSSION -----

The LaserWriter Select 310 shipped with a standard 1.5 megabyte memory configuration. This is sufficient for printing standard letter size documents, but does not provide sufficient memory for PostScript to create a legal size page buffer. Attempting to print legal size pages on a LaserWriter Select 310 that only has 1.5 megabytes of memory causes the bottom few inches of the page to be clipped. To enable legal size printing, install either the 1MB or 4MB memory upgrade. The LaserWriter Select 310 uses standard 72 pin, 100ns or faster memory SIMMs.

Once the memory upgrade has been performed the LaserWriter Select 310 preference file must be updated. To do this perform the following steps:

Step 1

Open the chooser and select the LaserWriter Select 310 driver and port

Step 2

Press the 'Setup' button to obtain the current printer configuration

Step 3

Press the 'Done' button to save the current configuration information

To confirm that the memory has been properly installed and the driver configured

try printing a legal size page. If the page prints properly then the additional memory has been recognized by the printer. For further confirmation, the Technical Information Library article titled "LaserWriter Select 310: Determining Configuration" contains PostScript code you can download to the printer to confirm the memory amount.

GeoPort 2.0 Telecom Adapter Read Me (5/96)

Revised: 5/27/96
Security: Everyone

GeoPort 2.0 Telecom Adapter Read Me (5/96)

Article Created: 27 March 1995
Article Reviewed/Updated: 26 May 1996

TOPIC -----

This article is the GeoPort Telecom Adapter ReadMe file.

DISCUSSION -----

Software included in the GeoPort Telecom Adapter Kit

Apple Telecom Software

This includes all software necessary to use the GeoPort Telecom Adapter with the following Macintosh systems:

- Centris 660AV, Quadra 660AV, and Quadra 840AV.
- Power Macintosh 6100/60, 6100/66, 7100/66, 7100/80, 8100/80, 8100/100, and 8100/110.

The Apple Telecom User's Guide contains complete information about installing and using this software. An electronic Apple Telecom Upgrade Manual is included in the Telecom Documents folder so that you can learn about the new features if you upgraded electronically and don't have the Apple Telecom User's Guide. Disks 1 and 2 can also be used to install Apple Telecom 2.0 software on Macintosh systems equipped with an Express Modem card.

MegaPhone

This is a screen-based telephone application that delivers full support of the telephony capabilities of the Apple Telecom 2.0 software, including support for dialing from a graphical keypad, copying and pasting telephone numbers, dragging and dropping business card information, and voice-mail functions.

The GeoPort Telecom Adapter Kit also includes a free 30-day trial of call

logging, MegaDial dialing manager, intelligent synchronization with directory information (saving telephone numbers to a PowerTalk catalog, for example), and other extended capabilities.

See also: the MegaPhone electronic manual included on Disk 3 (Telecom Applications).

Note: MegaPhone is not installed by the Apple Telecom Installer program. You must install it separately.

Note: MegaPhone is not included with free upgrades.

SITcomm SE/GTA

This is a terminal emulator application. With SITcomm SE/GTA (Special Edition for GeoPort Telecom Adapter), your Macintosh can communicate with a variety of other computers, linked by serial cables or by telephone lines.

With SITcomm you can exchange information with

- A colleague who is using another computer with similar communications software.
- Text-based information and electronic mail services, such as CompuServe or MCI Mail.
- Your company or school's remote minicomputer or mainframe.

See also: the SITcomm SE electronic manual included on Disk 4 (Telecom Applications).

Note: SITcomm is not installed by the Apple Telecom Installer program. You must install it separately.

Note: Disk 4 is not included with free upgrades. You can order the full upgrade, including SITcomm SE and the Apple Telecom User's Guide manual, by calling the Apple Order Center. Ask for the Apple Telecom software version 2.0 upgrade for use with your GeoPort Telecom Adapter.

Upgrading from Previous Releases of GeoPort Telecom Adapter Software

If you are installing this version of the software over an older version, you should use the Easy Install option rather than the Custom Install option. This ensures that all files are updated as necessary.

Note: if you have installed any customized fax cover pages and renamed the fax folder (called Express Fax in previous versions), the Installer moves them to the new Fax Folder. You can still use them, but if you want to keep them in a different folder, you'll need to drag them there manually.

When you have installed over an older version, the folders "Modem Documents" and "Express Fax" and the file "GeoPort ReadMe" may still be left on your hard disk from the earlier version. These are not necessary for using the newer version;

you may delete them.

Connection (CCL) scripts for Apple Remote Access

Use the following connection scripts with Apple Remote Access:

ARA 1.0: GeoPort Telecom ARA 1.x (in Extensions folder in System Folder)

ARA 2.0: GeoPort Telecom ARA 2.x (in Extensions folder in System Folder)

Note: These files are placed directly in the Extensions folder by the Installer program. You do not need to move or copy them there as stated in Appendix C of the Apple Telecom User's Guide. Apple Remote Access 1.0 does not support Power Macintosh computers. You can order an upgrade for Apple Remote Access by calling the Apple Order Center.

Two additional, optional connection (CCL) files, named GeoPort Telecom ARA 1.x/CNG and GeoPort Telecom ARA 2.x/CNG, are installed as well. When you use them, the GeoPort Telecom Adapter transmits data calling tones after dialing. Data calling tones allow the remote machine to detect automatically that an incoming call is a data modem call. If you are dialing into a system that supports data, fax and voice calls (such as another GeoPort Telecom Adapter) you should select it in the Apple Remote Access Setup control panel.

Note: The GeoPort Telecom ARA 1.x/CNG and GeoPort Telecom ARA 2.x/CNG files are installed in the Telecom Documents folder. Should you decide to use these optional files, you'll need to drag or copy them to the Extensions folder.

Note: If your Remote Access server uses a "Dial Back" feature, the server's return call back to your machine may be inadvertently directed to an open telephone application. To avoid this situation, either close these applications or open the Express Modem control panel and choose "Data" as the default call type when you expect an incoming call from another computer.

Using Fax Sender GX with QuickDraw GX 1.1

The Fax Sender GX extension described in chapter 8 of the Apple Telecom User's Guide can only be used with QuickDraw GX 1.1 or later. Depending on your location, QuickDraw GX 1.1 may not be available in your area at the time this software is released.

If you need to send complex greyscale images, you should use Fax Sender GX instead of Fax Sender. The image quality is superior.

Note: the Control-shift shortcut used to select Fax Sender without going through the Chooser is not available when using Fax Sender GX. However, you can create a desktop printer icon for Fax Sender GX and use drag-and-drop to accomplish the same thing.

Fax Sender GX initially defaults to Standard quality. If you plan to use a desktop printer and want to change the default to Fine quality, print a document from any GX-aware application (SimpleText, for example) and select Fine quality from the Fax Sender GX print dialog.

Please refer to the About Fax Sender GX electronic manual installed in the Telecom Documents folder or Chapter 8 of the Apple Telecom User's Guide for more information about this software.

Sharing Fax Sender GX on an AppleTalk network

Using Fax Sender GX, you can set up one machine on an AppleTalk network to be a central server for sending faxes. Other users on the network can send faxes without having the modem hardware installed in their computers.

In order to do this, the server must have the appropriate hardware installed. Both the server and client machines must have QuickDraw GX (version 1.1 or later) and the fax software installed. To install the fax software on a client machine, select the "Fax Sender GX Client Software" Custom Install option in the Apple Telecom Installer.

Note: If you are sharing your Express Modem or GeoPort Telecom Adapter on an AppleTalk network, try to minimize the time you spend in Fax preview. While you are previewing, other Fax Sender GX users may be paused.

Using the Apple Fax Gateway with PowerTalk 1.1

The Apple Fax Gateway extension should be used with PowerTalk 1.1 or later. PowerTalk 1.1 is included in the System 7.5 system software release.

Note: Apple Fax Gateway only sends AppleMail-compatible letters, text-only files, and PICT files. If you enclose a formatted document (for example, a word processor document) it will be skipped and not be included in the fax.

See also: the About Apple Fax Gateway electronic manual installed in the Telecom Documents folder.

FastPrint

The Fax Viewer program included with this package implements a new FastPrint feature. The speed of printing can be significantly improved but is only available if the preferred memory size setting of the Fax Viewer application is set to at least 1500K (the default is 290K). To enable FastPrint, select the FastPrint checkbox in the Fax Viewer print dialog box. Note that this feature only works with PostScript printers.

Troubleshooting

Connecting to online services that do not support data compression or error correction

First check to see if your software uses a "modem initialization string." If so, locate and remove "S48=0", if it appears in the string. If this does not work or it is not present, add "%C0S46=136" to the end of your modem initialization string (this disables compression). If this still does not work, try adding "&Q0" instead (this disables compression and error correction).

Another potential connection problem is your application getting confused by the

CARRIER message. Some applications misinterpret this as a CONNECT message and begin sending data. This will cause the GeoPort Telecom Adapter to drop the connection. Since it is still negotiating the connection, it will abort the call if it receives any data prior to the CONNECT message. If this is the case you may want to add a W0 command in the application's initialization string (this suppresses the CARRIER message).

Communication Settings

If you are using a terminal emulator or communications program that supports the Apple Communications Toolbox, you should select the "Express Modem Tool" from the connection settings menu item. This tool's default settings will always try to establish connections at the highest possible speed with error correction and compression enabled.

Identifying Incoming Calls

When answering your phone line, the GeoPort Telecom Adapter will attempt to determine the type of incoming call (fax, voice, or data) before transferring the call to a telephony application. Incoming fax calls are easily detected since the sending fax machine usually transmits a fax calling tone. Incoming data and voice calls are more difficult to detect since in many countries modems typically do not transmit a tone. In the Express Modem control panel, you can set the default call type for situations where no calling tone is detected. If you are using a voice telephony application (such as MegaPhone) we recommend that you select Voice as the default call type. If you are using a data telephony application (such as Apple Remote Access server) we recommend that you select Data as the default call type. If you expect to receive both voice and data calls, ask your callers to send a data calling tone when calling your machine. Use of these features is explained in detail in the Apple Telecom Upgrade Manual electronic document installed in the Telecom Documents folder.

If you have problems receiving calls from data modems (when using the Apple Remote Access dial back feature, for example), try decreasing the number of rings to Auto-answer in the Express Modem control panel (if permitted in your country). Some calling modems may time out and disconnect before your modem answers if the number of rings is too high.

Removing Fax Storage Folders

To protect your fax documents, the fax storage folders ("Fax Waiting To Be Sent", "Received Fax Documents", "Sent Fax Documents") are protected from accidental deletion. To bypass this mechanism, drag these folders to the trash, restart your computer, and then empty the trash. New, empty folders are created for you.

Note: If you want to throw away the fax storage folders using the steps given

above, they must not be enclosed in other folders when they are dragged to the trash or they will not be deleted.

Using a Centris 660AV or Quadra 660AV/840AV

If you are using a Centris 660AV or Quadra 660AV/840AV and experience errors when attempting to establish a connection, you may need to change the audio settings on your computer. The default setting of 24.000 kHz is compatible with the GeoPort Telecom Adapter. To change this setting open the sound control panel, choose "Sound Out" and select the "24.000 kHz" sampling rate.

Resetting a Blacklisting Error Message

Regulations in France, Japan, and a few other countries require that the Express Modem software blacklist recently dialed numbers when the connection fails. If you receive a "BLACKLISTED" error message when dialing, you can reset the BLACKLISTED condition by turning the Express Modem control panel off and then on. This software reset, equivalent to turning on and off a hardware modem, is compliant with PTT regulations.

Clicking Sound from GeoPort Telecom Adapter

If your machine freezes, the GeoPort Telecom Adapter can lose its connection with your machine and may generate a rapid clicking sound. This sound is a temporary side-effect of the lost connection. To stop the clicking, unplug the adapter for a few seconds or restart your machine.

Port Selection

The interface for selecting the correct communications port has been simplified since GeoPort Telecom Adapter software versions 1.0.2 (Power Macintosh) and 1.2.2 (660AV/840AV). The "Use internal modem instead of modem port" checkbox has been removed from the Express Modem Control Panel. The Express Modem control panel now automatically detects whether a GeoPort Telecom Adapter is actually attached to the Modem port. If so, all serial communications are first processed by the Express Modem software and transmitted through the GeoPort Telecom Adapter. If not, serial communication passes through the modem port directly.

GeoPort has been removed from the list of ports. The Express Modem control panel now automatically detects whether a GeoPort Telecom Adapter is actually attached to the Modem port. Select Modem Port whenever you wish to communicate through the GeoPort Telecom Adapter.

Optimized LocalTalk Performance

When you install the Apple Telecom software on a Power Macintosh, the Apple Telecom installer checks the version of LocalTalk on your machine and installs

..TIL17460-GeoPort_2-0_Telecom_Adapter_Read_Me_5-96_(TA33518).pdf

the latest version of LocalTalk if necessary. This version contains enhancements for the GeoPort Telecom Adapter.

What Goes Where

When you install the software using the Easy Install option of the Installer program, the following files and resources are installed on your hard disk.

Hard Disk:

- GeoPort Telecom Adapter Read Me
- SimpleText

Hard Disk: Telecom Applications: Fax Folder:

- Fax Terminal
- Fax Viewer
- Fax Cover
- Sample (cover document)
- Standard (cover document)
- My First Fax (PICT sample)

Hard Disk: Telecom Documents:

- About OCR (OCR manual for users who upgrade electronically)
- About Apple Fax Gateway (Gateway manual for users who upgrade electronically)
- About Fax Sender GX (Fax Sender GX manual for users who upgrade electronically)
- Apple Telecom Upgrade Manual
- Express Modem CCL (AppleLink CCL)
- GeoPort Telecom ARA 1.x/CNG (optional, transmits data calling tone, 660/840AV only)
- GeoPort Telecom ARA 2.x/CNG (optional, transmits data calling tone)
- Modem AT Command Set

Hard Disk: System Folder: Control Panels:

- Express Modem

Hard Disk: System Folder: Extensions:

- Apple Fax Gateway
- Apple Telecom Modem
- Express Modem Tool
- Fax Extension
- Fax Sender
- Fax Sender GX
- GeoPort for Power Macintosh (Power Macintosh only)
- GeoPort Extension (660/840AV only)
- GeoPort Serial Driver
- GeoPort Telecom Adapter
- GeoPort Telephone Tool
- GeoPort Telecom ARA 1.x (Apple Remote Access 1.0 CCL, 660/840AV only)
- GeoPort Telecom ARA 2.x (Apple Remote Access 2.0 CCL)
- Serial Extension
- Shared Library Manager
- Telephone Manager Extension

Hard Disk: System Folder: Mimetics:

- EasyReader Fax
- Neuroneye
- US Dictionary
- UK Dictionary

Hard Disk: System Folder: System:

- Bell Telephone (sound resource)
- Electronic Telephone (sound resource)

VBL Task: What Is It? (4/95)

=====

Article Created: 28 March 1995
Article Reviewed/Updated: 21 April 1995

TOPIC -----

What is a VBL task?

DISCUSSION -----

VBL refers to Vertical Blanking. The Macintosh video circuitry generates a vertical retrace interrupt (also known as the vertical blanking interrupt) 60 times a second when the beam of the display tube returns from the bottom of the screen to the top of the screen. This interrupt can be used to schedule periodic or recurrent tasks.

The vertical Retrace Manager of the Mac OS defines an Application Program Interface (API) to install or remove a routine that is to be executed during these interrupts. The Mac OS registers (installs) several Vertical Blanking (VBL) tasks to manage activities. Examples of System VBL tasks are:

- Increment the number of ticks (1/60 of a second) since system startup time.
- Check whether the stack has expanded into the heap.
- Handle cursor movement.
- Recognize a change in state of mouse button up or mouse button down.
- Recognize that a floppy disk has been inserted.
- Reset the keyboard if its is reattached.

Applications can also install VBL tasks that exist while it is running or are persistent in the System after its termination.

ImageWriter II: Problem When Using A/B Switchbox (3/95)

Revised: 3/28/95
Security: Everyone

ImageWriter II: Problem When Using A/B Switchbox (3/95)

=====

Article Created: 30 January 1995
Article Reviewed/Updated: 28 March 1995

TOPIC -----

Our customer currently has an ImageWriter II and Color StyleWriter Pro connected to their computer via an A/B switch box. They are able to print to the StyleWriter, then switch and print to the ImageWriter, but when they switch back to print to the StyleWriter, they get the message "The serial port is currently in use by another program, please quit that program and try printing again."

This message will continue to appear until they restart the machine and then it prints fine. In trying the same setup when using the modem and printer port instead of the switch box, it seems to work fine.

What is the problem?

DISCUSSION -----

This has been a long-standing issue with the ImageWriter driver where it captures the serial port for its use and then does not release it. The workaround you provided for your customer is the best suggestion, and should work.

There are currently no plans to revise the driver.

ARA 2.0 & MS Mail 3.1d: Remote Server Connection Issue (3/95)

Revised: 3/28/95
Security: Everyone

ARA 2.0 & MS Mail 3.1d: Remote Server Connection Issue (3/95)

=====

Article Created: 28 March 1995

TOPIC -----

This article is a Microsoft Product Support Services Application Note (Text File). The following information applies to Microsoft Mail for AppleTalk Networks, version 3.1d and Apple Remote Access (ARA) version 2.0.

This information is provided by Microsoft Corporation. Apple Computer, Inc. is not responsible for its content. Please contact Microsoft for additional information. This Microsoft Product Support Services Application Note and MM1048: REMOTE SERVER CONNECTION--ARA 2.0 COMPATIBILITY PATCH software can be found on Microsoft's ftp site at <ftp.microsoft.com> or the Web site at www.microsoft.com.

DISCUSSION -----

Introduction

The disk provided with this Application Note contains a patch program for use with version 3.1d of Microsoft Mail for AppleTalk Networks. This patch program fixes a compatibility problem that exists between Remote Server Connection and Apple Remote Access (ARA) version 2.0. In order to use Remote Server Connection with ARA 2.0, you must run the patch program to update the Mail server.

NOTE: If you do not plan to use Remote Server Connection with ARA 2.0, this patch is not necessary. No other changes to the Mail Server are made by this patch.

Running the Patch Program

This patch was designed to update version 3.1d of the Mail server. If you have an earlier version of Mail, you must upgrade to 3.1d before you run this patch.

1) While holding down the M key, restart the Mail server.

NOTE: This prevents the Mail server from loading.

2) Insert the enclosed MM1048 disk in your floppy disk drive.

3) If you are running your server as an Application, double-click the Mail 3.1d Application Patch icon. If your server is running as an INIT, double-click the Mail 3.1d INIT Patch icon.

NOTE: The default for the Mail server is to run as an INIT. If you have not converted your server to an Application using Mail Tools, then it is running as an INIT.

4) Read the information displayed and click OK.

5) When you are prompted to "Please Locate the Microsoft Mail Server," select the Mail server and choose Patch. The patch will run and update the Mail server. It will not affect any other parts of the server or the Microsoft Mail Data file.

6) Restart the Macintosh to enable the Mail server.

NOTE: Although this patch addresses compatibility issues with ARA 2.0, version 3.1d of Mail for AppleTalk Networks is not designed to take advantage of the new DialAssist feature in ARA 2.0. Any additional information entered in the DialAssist Control Panel will be ignored when Remote Server Connection connects to a remote site.

Communications Toolbox Tools: Basic Connectivity Set (3/95)

Revised: 3/28/95
Security: Everyone

Communications Toolbox Tools: Basic Connectivity Set (3/95)

=====

Article Created: 28 March 1995

TOPIC -----

This article describes the Communications Toolbox basic connectivity set of tools, and how to obtain them.

DISCUSSION -----

Communications Toolbox tools are designed to be used with Communications Toolbox aware applications. There are three types of tools; connection, terminal, and file transfer. The Basic Connectivity Tools are available via AppleLink, the Internet, and other online services. Most software packages that support the use of Communication Toolbox Tools will include some basic tools, for example MacTerminal 3.0 and ClarisWorks. There are also additional tools available from third parties, for example Kermit, LAT Tool and VT 320. For details on using these tools see the documentation for the Communications Toolbox aware application you will be using them with.

The Basic Connectivity Tools include:

Connection tools

Serial Tool
Modem Tool
AppleTalk ADSP Tool

Terminal tools

TTY
VT-102

File Transfer tools

Text
XMODEM

AppleSearch 1.5: Max. Users & Terminate Inactive Users (3/95)

Revised: 3/28/95
Security: Everyone

AppleSearch 1.5: Max. Users & Terminate Inactive Users (3/95)

=====

Article Created: 28 March 1995

TOPIC -----

I'm evaluating AppleSearch 1.5 Server running on a Power Macintosh 8100/100 to serve a client base of approximately 4,000 users. I need confirmation of the maximum number of simultaneous connected clients. I assume this number would be 150 since that is the number supported by AppleShare 4.0.x. Is this assumption correct? If not, are they limited by the number of clients signed on to the server or by the number of clients actually performing searches?

Also, is there any recommended way to force AppleSearch clients off the server after a specified period of inactivity?

DISCUSSION -----

AppleSearch has a limit of 50 simultaneous user connections, in other words, users logged into AppleSearch. See page 50 of the "AppleSearch Administrator's Guide."

As of March, 1995 there is no mechanism that would terminate inactive AppleSearch clients from the server. Scheduled reporters and the way they work make terminating inactive clients difficult to implement. This is because users need to be connected to the server in order to receive the data obtained from a scheduled reporter, so users could be inactive for extended periods of the time.

PlainTalk: No Custom Voices, An Explanation & Description (1/96)

Revised: 1/4/96
Security: Everyone

PlainTalk: No Custom Voices, An Explanation & Description (1/96)

Article Created: 28 March 1995
Article Reviewed/Updated: 4 January 1996

TOPIC -----

Did you ever wonder how to make your Macintosh speak what you have typed? The technology does exist. This article answers some commonly asked questions about PlainTalk and Text to Speech technology.

DISCUSSION -----

Question: Can I record a voice or create a new voice for Text to Speech? If yes, can I speak into the microphone to record this voice?

Answer: It is not possible for users to create PlainTalk voices by speaking into the microphone and recording their own speech. Creating PlainTalk voices is considerably more complex than that.

Question: In how many different voices can the Text-to-Speech/PlainTalk software speak?

Answer: The number of different voices available depends on the number of voices installed in the Voices folder, which is stored in the Extensions folder of your System Folder. Any application that has Text-to-Speech capabilities, such as SimpleText, can speak in any of the different voices in this folder.

Question: How does Text to Speech work?

Answer: Applications initiate speech generation by sending a set of words to the Speech Manager. The Speech Manager is responsible for sending the text to a speech synthesizer, the piece of software that manages all of the communication between the Speech Manager and the Sound Manager.

This synthesizer is like a speech engine. It uses built-in dictionaries and

pronunciation rules to help determine how to pronounce text. The speech synthesizer uses these rules and the available PlainTalk voices to convert typed text into different kinds of sound, with different tonal qualities, to produce speech.

Synthesizers have different rules, depending on the quality of the voices that are available. Users who have more RAM and processing power may choose a higher-quality voice, which may use a higher-quality synthesizer. A higher-quality synthesizer spends more time analyzing the original text, to try and produce sound that we more easily recognize as regular speech.

Question: How many words does the Text to Speech/PlainTalk dictionary know?

Answer: Because synthesizers use a combination of pronunciation rules and dictionaries, there is not necessarily a limit to the number of words that it can pronounce. The pronunciation rules are used to speak many of the words that are sent to the synthesizer.

The speech technology is not limited to a certain number of words the dictionary "knows". The dictionary mainly handles exceptions to the rules. For example, the dictionary is probably used to store the pronunciations for the abbreviation "St.". Depending on the context, PlainTalk pronounces this as "Saint" or "Street". Likewise, "Dr." could be pronounced "Doctor" or "Drive". Other exceptions, like the difference between pronouncing the vowel sounds in the words "height" and "weight" are included here as well.

PowerBook: Sizes and Suppliers for Torx Drivers (1/97)

=====

Article Created: 29 March 1995
Article Reviewed/Updated: 24 January 1997

TOPIC -----

Where can I obtain the Torx drivers used on the PowerBook computers?

DISCUSSION -----

PowerBook 100 computers use the Torx #8 and Torx #10 driver size.

PowerBook 200 and 2300 series computers use the Torx #8 and either Torx #6 driver size or phillips screws (for the floppy mechanism).

PowerBook 500 series computers use the Torx #6 and Torx #8 driver size.

PowerBook 5300 series computers use the Torx #8 driver size.

PowerBook 1400 series computers use the metric phillips screws 00 and 01.

Suppliers for these tools include:

* Apple Computer: (available through your local Service Provider)
Torx #6 077-0064
Torx #8 077-0677
Torx #10 077-0676

* Parts Express 800-338-0531

* Snap-On Tools (call 800-555-1212 for local Snap-On office)

* Jensen Tools, Inc. 800-426-1194

A/UX Error: Cannot Mount Drive, Dirty File System (3/95)

Revised: 3/29/95
Security: Everyone

A/UX Error: Cannot Mount Drive, Dirty File System (3/95)

=====

Article Created: 29 March 1995

TOPIC -----

I'm having problems re-installing the A/UX core. I get a message from the installer when I select software stating, "cannot mount drive c300d0s0: dirty file system".

Here is the procedure I followed to correct this:

- 1) In single user mode, I got hung trying to continue boot process.
- 2) Shut down with key.
- 3) From the startup shell, I used the fsck command on the drive with the -b16 option, which fixed a bad block count. I then ran fsck again with no -b16 option and it all went through fine
- 4) I opened the computer and verified that this wasn't an improperly terminated system, that all connectors are properly seated, and that I indeed had but one drive.
- 5) I attempted again to install A/UX, and I still got the error message.
- 6) I checked the partition map, and found that this drive is formatted as follows:
 - Mac Partition 133 MB
 - Slice 0 204 MB
 - Slice 3 6xx MB

I ran the installer again, but got the same error, file system is marked as dirty, slice 0 160030 used; 31961 free. What is wrong?

DISCUSSION -----

You should check to make certain your drive isn't full (both slice 0 and slice 3), and then use the fsck (file system check) command on BOTH slices on the drive. You can only fsck the root partition from within the startup shell, in order to fsck any other slices you will need to launch A/UX and use the fsck command. If this does not work, you will need to reformat the drive and re-install A/UX.

WARNING: You need to have a back up of your hard drive before formatting. The format process will erase all data.

You may find when you run the fsck command on slice 0 again, it will report dirty even though it was not used since the previous clean up. Then run the fsck command on slice 3. On completion of fsck, if you see a message that says "FILE SYSTEM WAS MODIFIED" it is recommended that you run fsck again using the same command. You want fsck to make a complete check without any changes.

You should now be able to install A/UX.

If your hard drive has slice 0, and also has a slice 3 data partition which is dirty, the installer may believe that slice 0 is dirty too. Somehow, slice 0 gets flagged as dirty as a result. You will need to run the fsck command on both partitions. This is an anomalous behavior.

MAE: PPD File For The HP LaserJet 4M Printer (3/95)

Revised: 3/29/95
Security: Everyone

MAE: PPD File For The HP LaserJet 4M Printer (3/95)

=====

Article Created: 29 March 1995

TOPIC -----

I'm using MAE 1.0 and I'm trying to use the HP 4M PPD file. I've gone into the Chooser, clicked on "lprwriter", clicked setup, then clicked select PPD, and selected HP LASERJET 4M.

I get a dialog that states, "Does not appear to be a valid Postscript Printer Description file." What is wrong?

DISCUSSION -----

The file you are selecting is NOT a Postscript Printer Description (PPD) file. It is a text file that reads:

Only Hewlett-Packard (HP) is distributing the PPD file for the LaserJet 4M. To receive this file, you must call 303-353-7650 and ask for the PPD Disk for LaserJet 4M.

System 7.5: Quadra 900/950 Sound Input Not Correct (8/95)

=====

Article Created: 29 March 1995
Article Review/Updated: 25 August 1995

TOPIC -----

I have just upgraded to System 7.5 from System 7.1 on my Quadra 900 and 950 computers in our office. Now when I try to record sound from the external RCA jack via the Sound Control Panel, I do not get any sound until we choose the "Internal CD" sound option.

I have installed System 7.5 Update 1.0 and the problem still exists. Why?

DISCUSSION -----

All of the sound input drivers were changed in System 7.5. Unfortunately on a Macintosh Quadra 900 and 950, the "Internal CD" and "External Audio" Sound input options were inadvertently switched. This means that Macintosh Quadra 900 and 950 users need to select the "Internal CD" Sound input option to record audio from external audio sources via the RCA jack. Users who have an internal CD-ROM drive installed need to choose the "External Audio" input option to record audio from their internal CD-ROM drive.

System 7.5 Update 1.0 does not correct the problem. This problem will be corrected in the next update to System 7.5.

Apple RAID: Generic Document Icon On Users Workstation (3/95)

Revised: 3/29/95
Security: Everyone

Apple RAID: Generic Document Icon On Users Workstation (3/95)

=====

Article Created: 29 March 1995

TOPIC -----

If I define an Apple RAID volume on a server, and set permissions to See Folder privileges, when users mount the volume from a client workstation they get a generic document icon on their desktop instead of the Apple RAID volume icon. How do I get the regular Apple RAID icon to appear?

DISCUSSION -----

Seeing a generic document icon will happen with any AppleShare server volume with a custom icon. Apple RAID's icon gets created as a custom icon. When you create a custom icon for a hard drive, the system creates an invisible file on the drive named "Icon" where the icon is stored. If the user is not allowed to see this file, they get no custom icon. Enabling a user to See Files permission will show the custom icon on the client's workstation.

LaserWriter Bridge 2.0: How To Use (3/97)

Revised: 4/21/97
Security: Everyone

LaserWriter Bridge 2.0: How To Use (3/97)

Article Created: 29 March 1995
Article Reviewed/Updated: 13 March 1997

TOPIC -----

This article describes using the LaserWriter Bridge software to connect your LocalTalk printer to an extended network.

DISCUSSION -----

Your LaserWriter printer has built-in support for a LocalTalk network. This allows you to connect the printer either to a single Macintosh computer or to a LocalTalk network of several computers and other devices. If you plan to use your printer with a single computer or as part of a LocalTalk network, you don't need to read this booklet.

In addition, you can create a "bridge" between your printer and an extended network such as Ethernet. To do so, you need to complete the following steps, described in this booklet:

- Connect the printer to a "host" Macintosh that is already part of an extended network.
- Install the LaserWriter Bridge software on the host Macintosh.
- Activate the LaserWriter Bridge software.

Connecting your printer to the network

Follow the instructions in the owner's guide that came with your printer to connect it to the Macintosh computer that will serve as the host computer. The host computer requires the following:

- The appropriate hardware and software for an extended network connection. For example, if you are connecting to an Ethernet network you need either an Ethernet card, or built-in Ethernet adapter, and EtherTalk software.

- System software version 7.0 or later.
- At least 4 MB of RAM (random access memory).

Installing the LaserWriter Bridge software

Follow these steps to install the LaserWriter Bridge software on the host Macintosh:

Step 1

Turn on the host Macintosh.

Step 2

Choose Control Panels from the Apple menu and double-click the Network icon.

Step 3

Select the network (such as EtherTalk) to which the host Macintosh is connected and close the Network control panel.

Step 4

Insert the LaserWriter Bridge disk in the floppy disk drive of the host computer.

Step 5

Drag the LaserWriter Bridge icon to the System Folder of your startup disk. A message appears asking whether you want to place LaserWriter Bridge in the Control Panels folder inside the System Folder.

Step 6

Click OK.

Step 7

Restart the host Macintosh.

Activating the LaserWriter Bridge software

Now that you have installed the LaserWriter Bridge software on your host Macintosh, you need to activate it. Follow these steps:

Step 1

Choose Control Panels from the Apple menu and double-click the LaserWriter Bridge icon.

Step 2

Click the On button to activate the LaserWriter Bridge software.

Step 3

Close the LaserWriter Bridge control panel.

Step 4

Restart the host Macintosh.

Whenever you start up the host Macintosh, the LaserWriter Bridge software will be active.

How the LaserWriter Bridge software works

Once you have installed and activated the LaserWriter Bridge software, the LocalTalk printer connected to the host Macintosh is available on the extended network whenever the host Macintosh is on. Network users can choose the printer in the Chooser, just as if it were a part of the extended network.

If there are AppleTalk routers on your extended network, multiple zones may be available to network users. In this case, the LocalTalk printer connected to the host Macintosh will appear in the same zone as the host Macintosh.

Because the host Macintosh must be on in order for the LocalTalk printer to be available to users on the extended network, you will see a dialog box when you choose Restart or Shut Down on the host Macintosh.

Click OK if you want to restart or shut down the computer. Click Cancel if you don't want to interrupt network users' access to the LocalTalk printer.

IMPORTANT: If File Sharing was active on the host Macintosh, choosing Restart or Shut Down will turn it off. It will be turned on again automatically the next time you start up the host Macintosh. If you clicked Cancel in the dialog box and want to reactivate File Sharing without restarting the computer, you need to click Start in the File Sharing section of the Sharing Setup control panel.

If you don't want this dialog box to appear each time you choose Restart or Shut Down, select the Disable shutdown warning checkbox in the LaserWriter Bridge control panel.

LaserWriter Fax: Using the WorldModem Without a Dialtone (3/95)

Revised: 3/29/95
Security: Everyone

LaserWriter Fax: Using the WorldModem Without a Dialtone (3/95)

=====

Article Created: 28 March 1995

TOPIC -----

My European customers have LaserWriter 16/600 PS printers with the International PostScript Fax Modem. They need for the printer fax modem to dial without first having to receive a dialtone.

Is there a setting somewhere to do this?

DISCUSSION -----

Posted to Apple supported online services is a patcher that enables blind dialing on the LaserWriter 16/600 PS International (WorldModem) PostScript Fax Modems. The patcher is called "Ignore Dialtone.sea

Using Ignore Dialtone

This software only works with the LaserWriter 16/600 PS International modem, also known as the "WorldModem."

Step 1

Open the Chooser and select a LaserWriter 16/600 PS having an International Fax Modem. Close Chooser.

Step 2

Launch the Ignore Dialtone patcher.

Thereafter, your fax modem will not wait for a dialtone prior to dialing. This change will be in effect until you power cycle your printer.

What is a System Error 25? (4/95)

Revised: 5/19/95
Security: Everyone

What is a System Error 25? (4/95)

=====

Article Created: 29 March 1995
Article Reviewed/Updated: 21 April 1995

TOPIC -----

My system crashes into MacsBug and each time, I am being dumped into the same routine. The current instructions look like this:

```
System Error 25 at 408314A _Jackson
_Jackson
+0000 408314A *Debugger
+0002 408314C _NewHandle, Immed
+0004 408314E BNE.S _DisposeCIcon+0032
```

It looks like I am hitting debug code. What is happening?

DISCUSSION -----

What you are running into is not debug code. The area of code you are seeing here is in the Macintosh ROM.

The label _Jackson is an abbreviated label for _JacksonPollack. Jackson Pollack was the development name for Color QuickDraw project and this area of ROM contains routines of Color QuickDraw.

A System Error 25 is a stack and heap collision detection. The Mac OS registers a routine to run on a periodic basis to check for the stack and heap overrunning each other. When the periodic routine runs, it checks two pointers that indicate the boundaries of the heap and stack. If, while the Vertical Blanking (VBL) task is running, it finds the bottom of the stack to be less than the top of the heap, an error 25 is reflected. If it was not for the routing checking performed by the periodic routine, this error could go undetected.

If MacsBug is installed, these error 25 problems usually show up in MacsBug as being at the _Jackson entry point. Without Macsbug installed, you may get a System Error 25 message or the "bomb" dialog box containing the Restart button.

The meaning of System Error 25 is often listed as "out of memory." It is usually an indication that the stack has temporarily overrun the heap and the computer should be restarted. The error might be eliminated by increasing the application's partition size (memory allocation) in the Get Info window to allow for more heap and stack space for that application. It could also be that the application is being driven into some improper calling sequence that causes the stack to grow until it overlaps the heap. If this is the case, you would need to contact the vendor of that application for further information about their software.

For more information about VBL technology see TIL article titled "VBL Task: What Is It?".

AWS 95: Server Disappearing From Network (5/95)

Revised: 5/31/95
Security: Everyone

AWS 95: Server Disappearing From Network (5/95)

Article Created: 30 March 1995
Article Reviewed/Updated: 31 May 1995

TOPIC -----

My Apple Workgroup Server (AWS) 95 cannot be seen from certain zones. It appears in the chooser, but after a few seconds gives a "no response from server" error when trying to access it.

I have completely rebuilt the AWS 80 computers that are serving as routers, with no change in this situation.

I have run the Update 2.0 on the AWS 95, with no change in this situation.

The trace I sent is for two attempts to access the AWS 95, when network traffic was very low. Could you please tell me what to do.

DISCUSSION -----

Trace of Access Attempts

From the following network trace, you can see a problem with the Apple Internet Routers on the network. However, the actual problem is with the AppleTalk stack, not with the Apple Internet Router code. This problem happens with other AppleTalk based services also, and is not exclusive to the AWS 95.

The problem can be see early in the trace in packets 3 - 10.

Packet 3 is an RTMP broadcast from Router 1
Packet 4 is an NBP LkUp from Router 2 requested by the end node
Packet 5 is an NBP Repl sent to Router 1
Packet 6 is the forwarded packet from Router 1 to Router 2
Packet 7 is an NBP LkUp from Router 2 requested by the end node
Packet 8 is an NBP Repl sent to Router 1
Packet 9 is the forwarded packet from Router 1 to Router 2
Packet 10 is an echo packet sent from Router 2 to the Ethernet address of Router

1 with the AppleTalk address of the AWS 95

Here Router 1 looks at the packet and determines it is not its packet. Since there is no need to forward it, the packet is dropped.

The problem is with the Address Mapping Table (AMT) in Router 2 that has gotten an erroneous entry in its cache. The problem occurred when the Server responded to Router 1 and Router 1 forwarded the Packet to Router 2. At which point Router 2 cached the AppleTalk address of the Server with the Ethernet address of Router 1.

Workaround

The workaround is to install the Network Software Installer (NSI) 1.5 on the Macintosh computers that are running the Apple Internet Router software. You might also want to consider moving the server behind a router; in other words to a segment of the network with only one router. If you do this, be sure the router is fast enough to handle the traffic to and from the server.

Macintosh 630: TV Tuner Card only for U.S. (3/95)

Revised: 3/30/95
Security: Everyone

Macintosh 630: TV Tuner Card only for U.S. (3/95)

=====

Article Created: 30 March 1995

TOPIC -----

I want to purchase the Macintosh 630 TV Tuner card, but I also want to use it when I travel to Europe and Australia. Can I use the TV Tuner Card outside the United States?

DISCUSSION -----

The United States uses an NTSC video signal, Australia and most European countries use a PAL video signal, which makes it impossible to use the Macintosh 630 family TV Tuner Card outside the United States.

The following computers are in the Macintosh 630 family: Performa 630, Performa 635, Performa 636, Performa 637, Performa 638, LC 630, and Quadra 630.

Power Macintosh 5200/75 LC: Technical Specifications (10/95)

Revised: 10/5/95
Security: Everyone

Power Macintosh 5200/75 LC: Technical Specifications (10/95)

=====

Article Created: 31 March 1995
Article Reviewed/Updated: 5 October 1995

TOPIC -----

This article gives the technical specifications for the Power Macintosh 5200/75 LC computer.

DISCUSSION -----

Microprocessor

- PowerPC 603 RISC microprocessor running at 75 MHz
- 256K Level 2 cache on 64-bit PPC bus
- Bus speed is 37.5 MHz. (processor speed/2)

Memory

- 8 MB RAM (one 8 MB SIMM installed)
- expandable up to 64 MB
- two 72-pin SIMM slots
- expandable one SIMM at a time (do not have to be similar density)
- 32-bit memory bus
- 80 ns or faster
- 1 MB DRAM frame buffer (separate from RAM) for video memory, not expandable
- 4 MB ROM on 64-bit PowerPC bus

Form Factor

- All in one enclosure
- Tilt from - 5° to +15°, Swivel 360°
- Front controls for volume and contrast
- Front headphone jack
- Infrared remote control
- Single power plug for system
- Power on/off from keyboard

Disk Drives

- 1.4 MB Apple SuperDrive disk drive - read and write MS-DOS disks
- 500 MB IDE hard drive, 1/3 height
- AppleCD 300i CD-ROM drive

Video Display

- 15" flat square shadow mask CRT
- .28 mm dot pitch
- User adjustable resolutions from 640x480 (63 DPI) to 832x624 (81 DPI) without restarting
- Refresh rate up to 75 Hz
- Low emissions (ELF, VLF)

Video Resolutions

Begin_Table

Resolution	Max. Bit Depth	Max. Number of Colors
-----	-----	-----
640 x 480	16	32,768
800 x 600	8	256
832 x 624	8	256

End_Table

Interfaces

- LC processor direct slot
- Video-in slot for optional video capture card
- TV tuner slot
- Communications slot
- SCSI interface for connecting up to five external devices
- Two serial (RS-232/RS-422) ports
- ADB port
- Sound-in (requires PlainTalk microphone)
- Sound-out
- Apple External Video Connector (M4099LL/A)
 - . - Purchased separately, this internal cable allows you to connect a Macintosh compatible display externally for video mirroring functionality.

Audio System

- Integrated stereo speakers
- Built-in microphone
- 16-bit CD audio, 8-bit sound

Networking

- Macintosh LC-compatible Processor-Direct Slot (PDS)
- I/O Communications Slot for installation of EITHER a high-speed, 14.4 fax/modem OR a low-cost Ethernet networking card supporting the following
- Apple Ethernet cards:

- Apple Ethernet CS Twisted Pair Card
- Apple Ethernet CS Thin Coax Card
- Apple Ethernet CS AAUI Card

Keyboard

- Supports all Apple Desktop Bus (ADB) keyboards

Mouse

- Apple Desktop Mouse 11: mechanical tracking, optical shaft, or contact encoding

Clock/Calendar

- CMOS customer chip and battery

Disability Access

- CloseView, Easy Access, and visible-beep software are built in.
- Third-party options provide alternative input and output devices

Electrical Requirements

- 110 - 240v, 50 - 60 Hz
- Power consumption 125 watts
- EPA Energy Star compliant

ADB Power Requirements

- Maximum power draw for all ADB devices is 500mA
- Mouse draws 10mA
- Keyboard draws 10mA

Size and Weight

- Height: 17.5 in. (44.5 cm)
- Width: 15.1 in. (38.3 cm)
- Depth: 16.0 in. (40.6 cm)
- Weight: 47 lb. (21.15 kg)

Operating Environment

- 10°C to 40° C (50°F to 104°F)

System Software Requirements

- Mac OS System 7.5 with Apple Guide, AppleScript and PC Exchange included

Article Change History:

05 Oct 1995 - Added video memory information.

..TIL17486-Power_Macintosh_5200-75_LC-Technical_Specifications_10-95_(303_Pow).pdf

11 Aug 1995 - Reformatted to make more readable on the World Wide Web.

19 Jul 1995 - Corrected memory speed requirements.

Macintosh LC 580: Technical Specifications (5/95)

Revised: 5/24/95
Security: Everyone

Macintosh LC 580: Technical Specifications (5/95)

Article Created: 31 March 1995
Article Reviewed/Updated: 24 May 1995

TOPIC -----

This article gives the technical specifications for the Macintosh LC 580 computer.

DISCUSSION -----

Microprocessor

- 66/33 MHz 68LC040
- Socketed for easy microprocessor replacement for future upgrades (PowerPC)
- . or third party expansion (microprocessor with built-in FPU)

Memory

- 8 MB of RAM (4 MB soldered to logic board, one 4 MB SIMM installed)
- expandable to 52 MB
- two 72-pin SIMM sockets
- 32-bit memory bus
- 80 ns or faster

Form Factor

All-in-one design similar to Macintosh LC 575.

Disk Drives

- 1.4 MB Apple SuperDrive floppy - read and write MS-DOS disks
- 500 MB IDE hard drive, 1/3 height
- Dual speed CD-ROM drive
- 650+ MB capacity
- 295 ms average access time

Video Display

- 14" high resolution display
- .28 mm dot pitch
- 640 x 480 pixel resolution
- 32K colors built-in
- Low emissions (ELF/VLF)

Expansion & Ports

- LC Processor direct slot
- Video-in slot
- SCSI interface for connecting up to five external devices
- Communication slot can be easily configured -- by the user -- to accept any of three Ethernet cards (10BASE-T, Thin Coax, Apple AUI), or a high-speed 14.4 KB fax/modem (based on PowerBook Express Modem).
- Two serial (RS-232/RS-422) ports
- One stereo sound-output port for external audio amplifier or headphones
- One Apple Desktop Bus (ADB) ports for keyboard, mouse, and other devices
- Apple EVC (External Video Connector, part number M4099LL/A)
 - Purchased separately from the computer itself, this internal cable allows you to connect a Macintosh compatible display externally for video mirroring functionality.
- Built-in microphone above display
- One sound-input port for internal or external microphone*, internal CD-ROM

* - Note: Requires PlainTalk microphone.

Audio System

- Plays and Records at 11 k-Hz or 22kHz sample rate
- Two speakers with enhanced stereo sound
- Plays ordinary compact disks w/ CD ROM drive

Networking

- User installable Ethernet cards for 10Base-T, Thin Coax, and AAUI
- User installable 14.4KB Fax Modem card

Keyboard

- Supports all Apple Desktop Bus (ADB) keyboard

Mouse

- Apple Desktop Mouse II: mechanical tracking, optical shaft, or contact encoding
- Maximum power draw for all ADB devices is 500mA
- Mouse draws 10mA

Clock/Calendar

- CMOS custom chip with battery

Disability Access

- CloseView, Easy Access, and visible-beep software are built in.
- Third-party options provide alternative input and output devices

Electrical Requirements

- Line voltage:100 to 240V AC, RMS automatically configured
- Frequency: 50 to 60 Hz(+/-) 3 Hz single phase
- Power:120 W maximum

ADB Power Requirements

- Maximum power draw for all ADB devices is 500mA
- Mouse draws 10mA
- Keyboard draws 10mA

Size and Weight

- Height 17.9 in. (45.5 cm)
- Width 13.5 in. (34.4 cm)
- Depth 16.5 in. (42.0 cm)
- Weight 40.5 lb. (18.4 kg)

Operating Environment

- 10°C to 40° C (50°F to 104°F)

System Software Requirements

- Mac OS System 7.5 with Apple Guide, AppleScript and PC Exchange included

Article Change History:

24 May 1995 - Further clarified optional FPU information.

22 May 1995 - Added information about external video connector option.

19 May 1995 - Clarified optional FPU.

Workgroup Server 6150/66: Description (3/95)

Revised: 3/31/95
Security: Everyone

Workgroup Server 6150/66: Description (3/95)

Article Created: 31 March 1995

TOPIC -----

This article describes the Workgroup Server 6150/66.

DISCUSSION -----

The Workgroup Server 6150/66 is the most affordable member of the PowerPC processor-based Workgroup Server family from Apple. It delivers the file and print, Internet, and applications server performance that small workgroups in business and education demand. And it's ideal for workgroups that use both Macintosh and Windows software-based computers.

Servers are high-performance, highly reliable systems that provide organizations with faster, more efficient shared network services and secure centralized storage. The Workgroup Server 6150/66 not only meets these criteria, it also runs the Mac OS, making all of its capabilities incredibly easy to use.

Featuring a 66-megahertz PowerPC 601 processor with on-chip and level-2 cache, the Workgroup Server 6150/66 delivers outstanding performance. This power is supported by a large-capacity hard disk drive for convenient, comprehensive storage and a quadruple-speed CD-ROM drive. And increased reliability is provided by the inclusion of Apple RAID (Redundant Array of Independent Disks) Software, which supports disk mirroring, so your mission-critical information and applications are always accessible. Apple RAID Software also supports disk striping for improved performance. (Apple RAID mirroring or striping requires at least two disk drives.)

To make sure that you get the most out of all that power and capacity, the Workgroup Server 6150/66 comes bundled with software designed to streamline the tasks for both users and network managers. For users, there's everything from server-based contact management and scheduling software to solutions that allow workgroups to create, share, and review information electronically. For network managers, there's software to help manage application distribution and updates, server usage, and remote AppleShare administration. And the Workgroup Server

..TIL17488-Workgroup_Server_6150-66-Description_3-95.pdf

6150/66 includes AppleShare Client for Windows software, so Windows users on the network can access networked printers and files stored on a Workgroup Server running AppleShare file and print sharing software.

If you're considering a server for your workgroup, or an additional server for your network, look closely at the Workgroup 6150/66. It offers all of the server features small workgroups need at an affordable price.

Features

Expansion and storage

- Slot for processor-direct card or NuBus expansion card (7-inch)
- Internal 700MB hard disk drive
- Internal quadruple-speed CD-ROM drive
- SCSI bus to support up to seven devices (two internal, five external)
- Eight ports support a wide range of peripherals

Networking

- Built-in Ethernet and LocalTalk capabilities
- Support for AppleTalk and TCP/IP networking protocols
- Token Ring support optional (with 7-inch NuBus card)

Power, speed, and memory

- 66-MHz PowerPC 601 RISC microprocessor with floating-point processor and 32K on-chip cache
- 256K level-2 cache
- 16MB of RAM, expandable to 72MB

Features Built Into Every Workgroup Server

Fast, easy setup

- Comes with System 7.5.1 software installed
- Includes AppleShare 4.1 file and print server software (some configurations)

Compatibility

- Comes with AppleShare Client for Windows
- Can be ordered as part of the Apple Internet Server Solution for the World Wide Web

Bundled software

- Includes a variety of server administration and user productivity tools, including Apple RAID Software

Service and support*

- Includes 24-hour telephone support
- Includes within-two-business-day, on-site service response
- Offers optional within-four-hour or next-business-day on-site service response

* These services are available only in certain areas of the U.S.

Workgroup Server 6150/66: Technical Specifications (3/95)

=====

Article Created: 31 March 1995

TOPIC -----

This article provides the technical specifications and ordering information for the Workgroup Server 6150/66.

DISCUSSION -----

Technical Specifications
=====

Microprocessor

- PowerPC 601 RISC microprocessor running at 66 MHz
- Integrated floating-point unit and 32K on-chip cache
- 256K level-2 cache

Memory

- 16MB of RAM
- Can be expanded to up to 72MB of RAM

Drives

- One 700MB internal hard disk drive
- One AppleCD 600i Plus CD-ROM drive (up to 600KB/s data-transfer rate)
- One Apple SuperDrive 1.4MB floppy disk drive that reads, writes, and formats Macintosh, Windows, MS-DOS, and OS/2 disks

Bundled software

Server administration tools

- FileWave - Automated software and data distribution
- Server Manager* - Remote AppleShare management tools
- Apple RAID Software - Disk striping and data mirroring

* Only included in AppleShare configurations

User productivity tools

- AppleShare Client for Windows - Enables Windows clients to connect to an AppleShare server
- Now Contact - Contact management software
- Now Up•to•Date - Group scheduling software
- Viper Instant-Access - Cross-platform information retrieval system
- Adobe Acrobat Reader - Viewing application for portable document format (PDF) files

Note: The only software bundled with the 6150/66 when it is used as part of the Apple Internet Server Solution for the World Wide Web is Apple RAID Software and AppleShare Client for Windows

Networking

- Built-in Ethernet
- Two serial ports for LocalTalk
- Supports TCP/IP networking software with MacTCP

Displays

- Supports up to 14-inch Apple displays at 32,768 colors, and 16- and 17-inch Apple displays at 256 colors
- Supports most third-party displays as well as VGA and SVGA monitors

Video support

- Built-in DRAM display support

Interfaces

- One Apple Desktop Bus (ADB) port for a keyboard, mouse, and other device
- AAUI-15 Ethernet connector
- High-density display port supports Apple AudioVision monitors directly and supports other displays via a Power Macintosh Display Adapter (included)
- Two DMA serial (RS-232/RS-422) ports compatible with LocalTalk
- High-speed asynchronous SCSI interface connects up to seven SCSI devices
- 16-bit stereo sound input and output ports
- Internal expansion slot for processor-direct or 7-inch NuBus expansion card (both require adapter that must be purchased separately)

Clock/calendar

- Custom integrated circuit with long-life lithium battery

Disability access

- Easy Access and visible beep included with system software to provide alternative input and output devices for people with disabilities

Electrical requirements

- Line voltage: 100 to 240 volts AC, RMS single phase, automatically configured
- Frequency: 50 to 60 Hz, single phase
- Power: 86 W maximum, not including display

ADB power requirements

- Maximum current draw for all ADB devices: 500 mA (a maximum of three ADB devices is recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA (varies with keyboard model used)

Keyboard and mouse

- Supports ADB keyboards with numeric keypads
- ADB Mouse II included

Size and weight

- Height: 3.4 in. (8.5 cm)
- Width: 16.3 in. (41.5 cm)
- Depth: 15.6 in. (39.9 cm)
- Weight: 14.0 lb. (6.4 kg) (varies based on internal devices installed)

Operating environment

- Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- Storage temperature: -40 to 116.6 degrees F (-40 to 47 degrees C)
- Relative humidity: 5% to 95% noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Regulatory approval

- FCC Class B

Ordering Information

Workgroup Server 6150/66 (16MB/700MB/CD)

Order No. M4066LL/A

- Workgroup Server 6150/66 with 16MB of RAM, 256K level-2 cache, 700MB disk drive, internal quadruple-speed CD-ROM drive, 1.4MB Apple SuperDrive floppy disk drive, and mouse
- System 7.5.1 and bundled software
- Power Macintosh Display Adapter
- Complete setup, learning, and reference documentation
- Limited one-year warranty

Workgroup Server 6150/66 (16MB/700MB/CD) with AppleShare

Order No. M4067LL/A

- Identical to the above configuration, with the addition of AppleShare 4.1 software

Apple Internet Server Solution for the World Wide Web 6150/66

Order No. M4140LL/A

- Identical to order No. M4066LL/A, but includes Apple Internet Server Solution software

Macintosh Memory Expansion Kits

A variety of memory expansion kits are available. Check with your Apple reseller for details.

Power Macintosh 6100/60 NuBus Adapter Card

Order No. M2337LL/A

- Allows you to add support for one 7-inch NuBus card to Workgroup Server 6150/66

Apple Token Ring NB/c Card

Order No. M1769Z/A (7-inch)

Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

Workgroup Server 8150/110: Description (7/95)

Revised: 7/7/95
Security: Everyone

Workgroup Server 8150/110: Description (7/95)

Article Created: 31 March 1995
Article Reviewed/Updated: 7 July 1995

TOPIC -----

This article describes the Workgroup Server 8150/110.

DISCUSSION -----

The Workgroup Server 8150/110 is the midrange member of the PowerPC processor-based Workgroup Server family from Apple. It delivers the file and print, database, Internet, and applications server capabilities that meet the needs of medium sized workgroups in education, business, and publishing. And it's ideal for workgroups that use both Macintosh and Windows software-based computers.

Servers are high performance, highly reliable systems that provide organizations with faster, more efficient shared network services and secure centralized storage. The Workgroup Server 8150/110 not only meets these criteria, it also runs the Mac OS, making all of its capabilities incredibly easy to use.

Featuring a 110-megahertz PowerPC 601 processor with on-chip and level-2 cache, the Workgroup Server 8150/110 delivers outstanding performance. This power is supported by a large capacity hard disk drive for convenient, comprehensive storage and a quadruple speed CD-ROM drive. And increased reliability is provided by a DAT drive, Retrospect Remote backup software, and Apple RAID (Redundant Array of Independent Disks) Software, which supports disk mirroring for increased data reliability and disk striping for improved performance. (Apple RAID mirroring or striping requires at least two disk drives.)

To make sure that you get the most out of all that power and capacity, the Workgroup Server 8150/110 comes with additional software. For users, there's everything from server-based contact management and scheduling software to solutions that allow workgroups to create, share, and review information electronically. For network managers, there's software to help manage application distribution and updates, server usage, and remote administration.

And the Workgroup Server 8150/110 includes AppleShare Client for Windows software, so Windows users on the network can access networked printers and files stored on a Workgroup Server running AppleShare file and print sharing software.

So if you want a server that can accommodate today's budget and expand to handle tomorrow's demands, the Workgroup Server 8150/110 is the server you've been waiting for.

Features

Expansion and storage

- Three NuBus slots for expansion cards
- One processor-direct slot
- Up to two internal drive bays for 1GB, 2GB, or 4GB hard disk drives or a DDS-2 Digital Audio Tape (DAT) drive (some configurations)
- Internal quadruple-speed CD-ROM drive
- Eight ports support a wide range of peripherals
- Two SCSI DMA buses to support up to nine devices (three internal, six external)

Networking

- Built-in Ethernet and LocalTalk capabilities
- Support for AppleTalk and TCP/IP networking protocols
- Token Ring support optional (with NuBus card)

Power, speed, and memory

- 110-MHz PowerPC 601 RISC processor with floating-point processor and 32K on-chip cache
- 256K level-2 cache
- 16MB of RAM, expandable to 264MB

Features Built Into Every Workgroup Server

Fast, easy setup

- Comes with System 7.5.1 software installed
- Includes AppleShare 4.1 file and print server software (some configurations)

Compatibility

- Comes with AppleShare Client for Windows
- Can be ordered as part of the Apple Internet Server Solution for the World Wide Web

Bundled software

- Includes a variety of server administration and user productivity tools, including Apple RAID Software and Retrospect Remote (with DAT drive configurations)

Service and support*

- Includes 24-hour telephone support
- Includes within-two-business-day, on-site service response
- Offers optional within-four-hour or next-business-day on-site service response

* These services are available only in certain areas of the U.S.

Article Reviewed/Updated: 7 July 1995

TOPIC -----

This article provides the technical specifications and order information for the Workgroup Server 8150/110.

DISCUSSION -----

Technical Specifications
=====

Microprocessor

- PowerPC 601 RISC microprocessor running at 110 MHz
- Integrated floating-point unit and 32K on-chip cache
- 256K level-2 cache; 1MB available in Build-to-Order configuration

Memory

- 16MB of RAM
- Can be expanded to up to 264MB of RAM

Drives

- Up to two internal driv bays for 1GB, 2GB, or 4GB hard disk drives or a DDS-2 Digital Audio Tape (DAT) drive (some configurations)
- One AppleCD 600i Plus CD-ROM drive (up to 600KB/s streaming data-transfer rate)
- One Apple SuperDrive 1.4MB floppy disk drive that reads, writes, and formats Macintosh, Windows, MS-DOS, and OS/2 disks

Bundled software

Server administration tools

- FileWave - Automated software and data distribution
- Server Manager* - Remote AppleShare management tools
- Apple RAID Software - Disk striping and data mirroring
- Retrospect Remote** - Automated backup software

* Only included in AppleShare configurations

** Only included in DAT drive configurations

User productivity tools

- AppleShare Client for Windows - Enables Windows clients to connect to an AppleShare server
- Now Contact - Contact management software
- Now Up•to•Date - Group scheduling software
- Viper Instant-Access - Cross-platform information retrieval system
- Adobe Acrobat Reader - Viewing application for portable document format (PDF) files

NOTE: The only software bundled with the 8150/110 when it is used as part of the Apple Internet Server Solution for the World Wide Web is Apple RAID Software and AppleShare Client for Windows.

Displays

- Supports up to 14-inch Apple displays at 32,768 colors, and 16- and 17-inch Apple displays at 256 colors
- Supports most third-party displays as well as VGA and SVGA monitors

Video support

- Built-in DRAM display support

Interfaces

- Three NuBus expansion slots
- One processor-direct slot
- One Apple Desktop Bus (ADB) port for a keyboard, mouse, and other device
- AAUI-15 Ethernet connector
- High-density display port supports Apple AudioVision monitors directly and supports other displays by a Power Macintosh Display Adapter (included)
- Two DMA serial (RS-232/RS-422) ports compatible with LocalTalk
- Two high-speed asynchronous SCSI DMA buses; one supports up to five external and two internal SCSI devices, the other supports up to two internal hard disks
- 16-bit stereo sound input and output ports

Networking

- Built-in Ethernet
- Two serial ports for LocalTalk
- Supports TCP/IP networking software with MacTCP

Clock/calendar

- Custom integrated circuit with long-life lithium battery

Disability access

- Easy Access and visible beep included with system software to provide alternative input and output devices for people with disabilities

Electrical requirements

- Line voltage: 100 to 240 volts AC, RMS single phase, automatically configured
- Frequency: 50 to 60 Hz, single phase
- Power: 200 W maximum, not including display

ADB power requirements

- Maximum current draw for all ADB devices: 500 mA (a maximum of three ADB devices is recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA (varies with keyboard model used)

Keyboard and mouse

- Supports ADB keyboards with numeric keypads
- ADB Mouse II included

Size and weight

- Height: 14.25 in. (30.6 cm)
- Width: 8.9 in. (19.6 cm)
- Depth: 16.0 in. (39.6 cm)
- Weight: 25.3 lb. (11.5 kg) (varies based on internal devices installed)

Operating environment

- Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- Storage temperature: -40 to 116.6 degrees F (-40 to 47 degrees C)
- Relative humidity: 20% to 80% noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Regulatory approval

- FCC Class A

Ordering Information

Workgroup Server 8150/110 (16MB/1GB/CD/DAT)

Order No. M4042LL/A

- Workgroup Server 8150/110 with 16MB of RAM, 256K level-2 cache, 1GB hard disk drive, DDS-2 DAT drive, quadruple-speed CD-ROM drive, 1.4MB Apple SuperDrive floppy disk drive, and mouse

- System 7.5.1 and bundled software
- Power Macintosh Display Adapter

Workgroup Server 8150/110 (16MB/1GB/CD/DAT) with AppleShare

Order No. M4065LL/A

- Identical to the above configuration, with the addition of AppleShare 4.1 software

Workgroup Server 8150/110 (16MB/1GB/CD) with AppleShare

Order No. M4007LL/A

- Workgroup Server 8150/110 with 16MB of RAM, 256K level-2 cache, 1GB hard disk drive, 1.4MB Apple SuperDrive floppy disk drive, quadruple-speed CD-ROM drive, System 7.5.1, AppleShare 4.1 software, and bundled software

Workgroup Server 8150/110 Build-to-Order

Order No. M4043LL/A

- Base chassis includes 8MB RAM, 1.4MB Apple SuperDrive floppy disk drive, quadruple-speed CD-ROM drive, System 7.5.1 software, and Apple RAID Software

Apple Internet Server Solution for the World Wide Web 8150/110

Order No. M4141LL/A

- Identical to Order No. M4007LL/A (without AppleShare 4.1) but includes Apple Internet Server Solution software

Workgroup Server 8150/110 Logic Board Upgrade

Order No. M4046LL/A

- Upgrades a Workgroup Server 80 or Workgroup Server 8150 to a Workgroup Server 8150/110
- Includes AppleShare 4.1 Update Kit, System 7.5.1, Apple RAID Software and 8MB of RAM. Additional RAM may be required.

Macintosh Memory Expansion Kits

A variety of memory expansion kits are available. Check with your Apple reseller for details.

Apple Token Ring NB/c Card

Order No. M1769Z/A (7-inch)

Apple Token Ring 4/16 NB/c Card

Order No. M0415LL/B (12-inch)

Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

Workgroup Server 9150/120: Description (3/95)

Article Created: 31 March 1995

TOPIC -----

This article describes the Workgroup Server 9150/120.

DISCUSSION -----

The Workgroup Server 9150/120 is the most expandable and powerful member of the PowerPC processor-based Workgroup Server family from Apple. It delivers file and print, database, Internet, and communications capabilities that meet the needs of growing workgroups in education, business, and publishing. And it's ideal for work-groups that use both Macintosh and Windows software-based computers.

Servers are high-performance, highly reliable systems that provide organizations with faster, more efficient shared network services and secure centralized storage. The Workgroup Server 9150/120 not only meets these criteria, it also runs the Mac OS, making all of its capabilities incredibly easy to use.

Featuring a 120-megahertz PowerPC 601 processor with on-chip and 1-megabyte level-2 cache, the Workgroup Server 9150/120 delivers all the performance benefits of state-of-the-art RISC technology. This power is supported by two large-capacity hard disk drives for convenient, comprehensive storage with space for three more, and a quadruple-speed CD-ROM drive. And increased reliability is provided by a DAT drive, Retrospect Remote automatic server and client backup software, and Apple RAID (Redundant Array of Independent Disks) Software, which supports disk mirroring for increased data reliability and disk striping for improved performance. (Apple RAID mirroring or striping requires at least two disk drives.)

To make sure that you get the most out of all that power and capacity, the Workgroup Server 9150/120 comes with additional software. For users, there's everything from server-based contact management and scheduling software to solutions that allow workgroups to create, share, and review information electronically. For network managers, there's software to help manage

application distribution and updates, server usage, and remote AppleShare administration. And the Workgroup Server 9150/120 includes AppleShare Client for Windows software, so Windows users on the network can access networked printers and files stored on a Workgroup Server running AppleShare file and print sharing software.

So if you need a high-performance server for a large and expanding workgroup, we have the solution: the powerful and expandable Workgroup Server 9150/120.

Features

Expansion and storage

- Four NuBus slots for expansion cards
- One processor-direct slot (PDS)
- One or two internal 1GB, 2GB, or 4GB hard disk drives
- Space for up to five internal 3.5-inch half-height hard disk drives (20GB total)
- Internal DDS-2 Digital Audio Tape (DAT) drive (some configurations)
- Internal quadruple-speed CD-ROM drive
- Two SCSI DMA buses to support up to 14 devices (7 internal, 7 external)
- Ten ports support a wide range of peripherals

Networking

- Built-in Ethernet and LocalTalk capabilities
- Support for AppleTalk and TCP/IP networking protocols
- Token Ring support optional (with NuBus card)

Power, speed, and memory

- 120-MHz PowerPC 601 RISC micro-processor with floating-point processor and 32K on-chip cache
- 1MB level-2 cache
- 16MB of RAM, expandable to 264MB

Features Built Into Every Workgroup Server

Fast, easy setup

- Comes with System 7.5.1 software installed
- Includes AppleShare 4.1 file and print server software (some configurations)

Compatibility

- Comes with AppleShare Client for Windows
- Can be ordered as part of the Apple Internet Server Solution for the World Wide Web

Bundled software

- Includes a variety of server administration and user productivity tools including Apple RAID Software and Retrospect Remote (with DAT drive configurations)

Service and support*

- Includes 24-hour telephone support
- Includes within-two-business-day, on-site service response
- Offers optional within-four-hour or next-business-day on-site service

response

* These services are available only in certain areas of the U.S.

Workgroup Server 9150/120: Technical Specifications (3/95)

=====

Article Created: 31 March 1995

TOPIC -----

This article provides the technical specifications for the Workgroup Server 9150/120.

DISCUSSION -----

Technical Specifications

=====

Microprocessor

- PowerPC 601 RISC microprocessor running at 120 MHz
- Integrated floating-point unit and 32K on-chip cache
- 1MB level-2 cache; 256KB available in Build-to-Order configuration

Memory

- 16MB of RAM
- Can be expanded to up to 264MB of RAM

Drives

- Up to five internal 1GB, 2GB, or 4GB Apple hard disk drives
- One DDS-2 DAT drive (4GB uncompressed, 10 to 14GB compressed); some configurations
- One AppleCD 600i Plus CD-ROM drive (up to 600KB/s data-transfer rate)
- One Apple SuperDrive 1.4MB floppy disk drive that reads, writes, and formats Macintosh, Windows, MS-DOS, and OS/2 disks

Bundled software

Server administration tools

- FileWave - Automated software and data distribution

- Server Manager* - Remote AppleShare management tools
- Apple RAID Software - Disk striping and data mirroring
- Retrospect Remote** - Automated backup software

* Only included in AppleShare configurations

** Only included in DAT drive configurations

User productivity tools

- AppleShare Client for Windows - Enables Windows clients to connect to an AppleShare Server
- Now Contact - Contact management software
- Now Up•to•Date - Group scheduling software
- Viper Instant-Access - Cross-platform information retrieval system
- Adobe Acrobat Reader - Viewing application for portable document format (PDF) files

NOTE: The only software bundled with the 9150/120 when it is used as part of the Apple Internet Server Solution for the World Wide Web is Apple RAID Software, AppleShare Client for Windows, and Retrospect Remote.

Displays

- Supports up to 14-inch Apple displays at 32,768 colors, and 16- and 17-inch Apple displays at 256 colors
- Supports most third-party displays as well as VGA and SVGA monitors

Video support

- Built-in DRAM display support

Interfaces

- Four NuBus expansion slots
- One processor-direct slot
- One Apple Desktop Bus (ADB) port for a keyboard, mouse, and other device
- AAUI-15 Ethernet connector
- Two DMA serial (RS-232/RS-422) ports compatible with LocalTalk
- Two high-speed asynchronous SCSI DMA buses; one supports up to 7 external SCSI devices, the other supports up to 7 internal SCSI devices (for a total of 14)
- 16-bit stereo sound input and output ports
- DB-15 video port for display support

Networking

- Built-in Ethernet
- Two serial ports for LocalTalk
- Supports TCP/IP networking software with MacTCP

Clock/calendar

- Custom integrated circuit with long-life lithium battery

Disability access

-
- Easy Access and visible beep included with system software to provide alternative input and output devices for people with disabilities

Electrical requirements

- Line voltage: 100 to 240 volts AC, RMS single phase, automatically configured
- Frequency: 50 to 60 Hz, single phase
- Power: 303 W maximum, not including display

ADB power requirements

- Maximum current draw for all ADB devices: 500 mA (a maximum of three ADB devices is recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA (varies with keyboard model used)

Keyboard and mouse

- Supports ADB keyboards with numeric keypads
- ADB Mouse II included

Size and weight

- Height: 18.6 in. (47.3 cm)
 - Width: 8.9 in. (22.4 cm)
 - Depth: 20.6 in. (52.3 cm)
 - Weight: 36.8 lb. (16.7 kg)
- (varies based on internal devices installed)

Operating environment

- Operating temperature: 50 to 95 degrees F (10 to 35 degrees C)
- Storage temperature: -40 to 116.6 degrees F (-40 to 47 degrees C)
- Relative humidity: 20% to 80% noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

Regulatory approval

- FCC Class A

Ordering Information

=====

Workgroup Server 9150/120 (16MB/2 x 1GB/DAT/CD)

Order No. M4064LL/A

- Workgroup Server 9150/120 with 16MB of RAM, 1MB level-2 cache, two 1GB hard disk drives quadruple-speed CD-ROM drive, DDS-2 DAT drive, 1.4MB Apple SuperDrive floppy disk drive, and mouse
- System 7.5.1 and bundled software
- Power Macintosh Display Adapter

Workgroup Server 9150/120 (16MB/2 x 1GB/DAT/CD) with AppleShare

Order No. M4038LL/A

- Identical to the above configuration, with the addition of AppleShare 4.1 software

Workgroup Server 9150/120 (16MB/2GB/CD)

Order No. M4008LL/A

- Workgroup Server 9150/120 with 16MB of RAM, 1MB of level-2 cache, one 2GB hard disk drive, quadruple-speed CD-ROM drive, 1.4MB Apple SuperDrive floppy disk drive, System 7.5.1, and bundled software

Workgroup Server 9150/120 Build-to-Order

Order No. M4041LL/A

- Base chassis includes 8MB of RAM, 1.4MB Apple SuperDrive floppy disk drive, quadruple-speed CD-ROM drive, System 7.5.1 software, and Apple RAID Software

Apple Internet Server Solution for the World Wide Web 9150/120

Order No. M4145LL/A

- Identical to Order No. M4064LL/A, but includes Apple Internet Server Solution software

Workgroup Server 9150 Logic Board Upgrade

Order No. M4047LL/A

- Upgrades a Macintosh Quadra 900, 950 or a Workgroup Server 9150 to a Workgroup Server 9150/120
- Includes 8MB of RAM, Apple RAID Software, AppleShare 4.1 Update Kit, and System 7.5.1 software. Additional RAM may be required.

Macintosh Memory Expansion Kits

A variety of memory expansion kits are available. Check with your Apple reseller for details.

Apple Token Ring NB/c Card

Order No. M1769Z/A (7-inch)

Apple Token Ring 4/16 NB Card

Order No. M1769Z/A (12-inch)

Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

Security: Everyone

AppleShare 4.1 & Client for Windows: Description (9/95)

=====

Article Created: 31 March 1995
Article Reviewed/Updated: 25 September 1995

TOPIC -----

This article describes and product details for AppleShare 4.1.

DISCUSSION -----

AppleShare is high-performance, easy-to-use file and print sharing software that allows networked Macintosh and Microsoft Windows software-based computers to share files, applications, and printers.

With AppleShare file server software, organizations can store all of their shared files and applications in a single, central location, providing convenient, easy access to every user on the local area network. By allowing networked users to centralize all key files and applications for easy sharing, AppleShare improves everyone's productivity. It eliminates time spent looking for files, worrying about misplaced documents, and determining the file or application version.

AppleShare print server software offers all users queued access to up to five networked printers. This time saving function allows users to be more productive because they can use their computers to tackle other tasks instead of waiting for documents to print.

Now, all networked users can connect easily to an AppleShare server. AppleShare lets Macintosh users access shared resources via the Mac OS, and Windows software-based computers users via the Windows interface. AppleShare's network architecture coexists with other application programs and networking services such as Novell NetWare, Windows for Workgroups, and even the Internet.

Yet for all of its power and capabilities, AppleShare is extremely reliable and easy to set up, use, and maintain.

It continues in the "plug and play" tradition established by the Macintosh more

than a decade ago; most system administrators find that they can get an AppleShare server up and running within 15 minutes. And overall maintenance including the addition and deletion of users is so simple that a dedicated, full-time administrator is not required. In fact, because AppleShare is so easy to install, maintain, reconfigure, and expand, it offers the lowest long-term cost of ownership of any product in its class.

Whether your organization is a small or medium-size business, a classroom, or a department within a global enterprise, AppleShare improves collaboration and increases efficiency for all users.

Features

=====

Powerful file and print services

- Lets users store their files and applications in a single, central location
- Makes it easy and efficient to print documents to networked printers
- Provides comprehensive, easy-to-implement security

Ease of use

- Installs with a single click of the mouse
- Can be up and running in minutes
- Makes day-to-day management quick and easy
- Users can take advantage of file and print services from either Macintosh computers or Windows software-based PCs
- Allows users to work in the operating system environment with which they are most familiar (Mac OS or Windows)

Compatibility

- Includes full support for both Macintosh and Windows clients
- Macintosh client built into the Mac OS; Windows client sold separately
- Server works with all Mac OS-compatible applications

Performance and scalability

- Supports up to 150 users
- Performs up to 10 times faster than built-in Mac OS file sharing
- Can be configured for use in an AppleTalk network of any size
- Is scalable from LocalTalk to Ethernet networks, and beyond
- Offers highest performance when running on PowerPC-based Workgroup Servers

Ordering and Licensing Information

=====

AppleShare 3.0.1

Order No. M0090LL/B

AppleShare 4.0.2

Order No. M3995Z/A

AppleShare 4.1

(Included in some PowerPC-based Workgroup Server configurations)

AppleShare Client for Windows

Order No. M3481Z/A

(Also included in PowerPC processor-based Workgroup Server configurations; client network license is included and allows the installation of the client software on any Windows software-based PC on the network)

AppleShare Product Family

=====

AppleShare software comes in three versions that are designed to accommodate a variety of workgroup sizes and performance needs.

AppleShare 3.0.1 is designed for smaller workgroups of Macintosh and Windows software-based computers that have outgrown the basic file sharing capabilities of the Mac OS. It runs on 68030-based, or earlier, Macintosh computers.

AppleShare 4.0.2 offers significant performance improvements over AppleShare 3.0.1, and runs on 68040-based Macintosh computers. Like AppleShare 3.0.1, it's appropriate for smaller, cross-platform workgroups that want to move beyond simple Mac OS file sharing and is extremely easy to set up and administer.

AppleShare 4.1 is the highest-performance AppleShare version available. Designed for Apple PowerPC processor-based Workgroup Servers, it offers outstanding performance and functionality, yet retains the ease of use shared by the other product offerings in the AppleShare family.

Product Details

=====

Capabilities and services

- Includes file and print servers
- Supports Mac OS program linking and publish and subscribe
- Features an open environment that allows additional network services
- Macintosh client software built into every Macintosh; Windows client software sold separately

Sharing options

- On-line CD-ROM exchange
- Sharing of folders or entire disks
- Easy server selection through the Chooser
- Intuitive, consistent access to shared resources
- User-controlled access to information

Print spooling

- Provides spooling for up to five networked printers

- Offers centralized queue management
- Accepts simultaneous print requests
- Frees client workstations for use immediately
- Includes print log for up to 1,000 print jobs

Administrator control

- Administrator can set number of connected users
- Server messages can be broadcast or sent to selected users
- Administrator can set cache sizes to maximize performance

Security

- Minimum password length
- Password aging
- Password history to prevent immediate reuse
- Ability to disallow saved passwords
- Account disabled after specified number of password failures
- Adjustable time limit for temporary accounts
- Guest access allowed; turned off by default
- Copy-protection setting for documents
- "Lock" setting for folders
- Adjustable number of concurrent application launches
- Inherited folder privileges
- Administrator log-off of any user

AppleShare Specifications

.	3.0.1	4.0.2	4.1
.	-----	-----	----
Concurrent logons	120	150	150
Open files	346	346	346
Users	8,192	8,192	8,192
Groups	8,192	8,192	8,192
Users in group	8,191	8,191	8,191
Groups per user	42	42	42
Locked ranges/user	20	20	20
Apple II logon	yes	yes	yes
Apple II network startups	40	n/a	n/a
Minimum RAM	4MB	8MB	16MB
System software	7.0	7.1	7.5

AppleShare Server

- AppleShare 3.0.1: 68030-based (or earlier) Macintosh computers
- AppleShare 4.0.2: 68040-based Macintosh computers*
- AppleShare 4.1: PowerPC processor-based Workgroup Servers

* AppleShare 4.0.2 is not designed to run on the Macintosh Quadra 660AV and Macintosh Quadra 840AV computers.

AppleShare Client

Macintosh

- An Apple Macintosh computer with an internal hard disk drive and at least 4MB of RAM
- Mac OS software version 6.0.7 or later
- System 7.5 required for performance of AppleShare 4.1

Windows

- Any IBM or 100 percent compatible computer running Intel processor 386 or greater; ISA, MicroChannel, VISA, and EISA internal buses; 4MB of RAM
- Windows 3.1, 3.11, or Windows for Workgroups 3.11 software
- MS-DOS 5.0 or later
- Ethernet network adapter card
- NDIS 3.0 or ODI network interface driver

Network requirements

-
- An AppleTalk network connection (via LocalTalk, Ethernet, Token Ring, or Apple Remote Access software); Windows software-based computers must be connected via Ethernet

Apple Software: System 7.1 Compatibility (4/97)

Article Created: 7 December 1992
Article Reviewed/Updated: 9 April 1997

TOPIC -----

****IMPORTANT NOTE**:**

The following information is correct as of March 31, 1995. There will be NO further updates to this article. System 7.5 is currently the standard operating system for all Macintosh computer systems. Hence, all testing of any new Apple software updates will be done with System 7.5, the current desktop standard, not with System 7.1.

A separate article will be maintained and updated regularly with information pertaining to compatibility of all shipping Apple software products and System 7.5. See the article titled "Apple Software: Current Versions" for more information.

The table below lists "current" Apple software products (both Apple II and Macintosh) and provides for each:

* Version The "current" version number as of 3/95.
* 7.1? Whether the product is compatible with System 7.1.
* Notes Additional information on the product

If it is not 32-bit clean, it will be noted in the notes section.

Additional articles in the Tech Info Library describe many of the products listed below. This article does not cover any announced Apple products which are not currently shipping.

DISCUSSION -----

Begin_Table

Product	Version	7.1?	Notes
---------	---------	------	-------

..TIL17496-Apple_Software-System_7-1_Compatibility_4-97_(TA33540).pdf

32-Bit System Enabler	1.0.3	ONLY	For Mac II, IIX, IICx, SE/30
3270 API Developer's Kit	2.0	N/A	APDA
8*24 GC (Extension)	7.0.1	YES	
950 Color Addition	1.0	----	Only for Quadra 950 running 7.0.1, fix is included in SSW 7.1.
A/UX	3.0.1	N/A	Incompatible with Centris 610, 650. With optional FPU installed in Centris 650, it is compatible.
A/UX	3.1	N/A	Only supports the AWS 95.
A/ROSE	1.2.1	YES	On NSI 1.4.4
ADSP	1.5.1		Not required, built-in part of SSW 7.0 & higher
Apple Backup	1.1	7.1P	Part of Performa OS only
Apple Color Printer	1.0	YES	Printer System Extension
Apple DocViewer	1.1.1	YES	Apple Extras folder of Power Macs
Apple Event Manager	1.0.3	YES	Part of AppleScript 1.1
Apple File Exchange	7.0	YES	Part of SSW 7.1
Apple Font Pack	1.0	YES	See separate article in Tech Info Library for contents
Apple Access II	1.3.1	N/A	For Apple II
Apple II System	3.2	N/A	For Apple II systems
Apple IIGS System	6.0.1	N/A	For Apple IIGS only.
Apple IIe Card Software	2.2.1	YES	
Apple Guide	1.2	NO	System 7.5 only
Apple Internet Router	3.0.1	YES	3.0.1 is a patch to 3.0
Apple Media Tool	1.0.1	YES	Ships with QT 1.6.1
Apple Modem Tool	1.5.3	YES	
Apple Personal Diag	1.1.1	YES	
Apple Phone	1.0.1	YES	Application bundled with AV models.
Apple Photo Access	2.0	YES	System Ext. comes w/ CD-ROM SW
Apple Restore	1.1	7.1P	Performa OS only, restores Apple Backup items
AppleScript	1.1	YES	Available from APDA or reseller
AppleSearch Client	1.0	YES	Part of AppleSearch package
AppleSearch Server	1.1	YES	1.1 patch for Power Macintosh
AppleShare File Server	3.0.3	YES	For any Macintosh, patch
AppleShare Print Server	3.0.2	YES	For any Macintosh, patchU
AppleShare File Server	4.0.1	YES	For most 68040 based Macintosh models
AppleShare File Server	4.0.2	YES	Version for Power Macintosh
AppleShare Print Server	4.0.1	YES	For most 68040 based Macintosh models
AppleShare Print Server	4.0.2	YES	Version for Power Macintosh
AppleShare Pro (File Svr)	1.1	N/A	Apple Workgroup Server 95 only
AppleShare Pro (print)	1.1	N/A	Apple Workgroup Server 95 only
Apple Shared Library Mgr	1.1	YES	1.0 ships with SSW 7.1.2. Used to make system more efficient For developers
AppleTalk	v.58.1.4	N/A	Use Network SW Installer 1.4.5
AppleTalk ImageWriter	7.0.1	YES	
Apple Remote Access	2.0.1	YES	Separate Client, Personal Server & Multiport Server versions.

..TIL17496-Apple_Software-System_7-1_Compatibility_4-97_(TA33540).pdf

AppleTalk-DECnet Tool	1.1	YES	
AppleTalk-LAT Gateway	1.0	YES	
AppleTalk-LAT Tool	1.0	YES	
Aristotle	xxx	N/A	For Apple II
Assistant Tidbit 1	1.0	YES	Part of PowerBook File Assistant 1.0
Assistant Tidbit 2	1.0	YES	Part of PowerBook File Assistant 1.0
Assistant Toolbox	1.0	YES	Part of PowerBook File Assistant 1.0
At Ease	2.0.3	YES	
At Ease for Workgroups	2.0.3	YES	
AudioVision (extension)	1.0	YES	Extension for AudioVision 14 Monitor
AutoRemounter	1.2	YES	PowerBook control panel
AV Serial Extension	1.0	YES	
AW Server 95	1.1	N/A	Part of AWS 95 Update 1.1
AWS 95 Tune-Up	1.0	N/A	System update disks (2) for the Apple Workgroup Server 95
Basic Color Monitor	1.0	YES	Eliminates overly green color on monitors attached to Macintosh Centris and Quadra models. Not required if HSU 2.0.1 is installed.
Basic Connectivity Set	1.1.1	YES	
Battery DA	7.1.1	YES	
Battery Recondition	1.0		
CD-ROM Setup	5.0.1	YES	
Chinese Language Kit	1.0	YES	Includes WorldScript II 7.1.2
Chooser	7.3	YES	For Jan 93 Printers Only
CloseView	7.1	YES	SSW 7.1, Fixes problems in 7.0 with Virtual Memory
ColorSync	1.0.5	YES	Color Imaging System Extension
Compatibility Checker	7.1.1	YES	SSW 7.1
CPU Energy Saver	1.0.1	YES	
Curare	1.0	YES	APDA Product
DAL Software	N/A		Contact ITI at 510-438-2095
DART	1.5.3	YES	
Disk Copy	4.2	YES	7.1 MUK
Disk First Aid	7.2.2	YES	Part of Software Utility Update 2.0.1
Display Enabler	1.2	YES	Part of Apple Multiple Scan Display SW 1.0DOS
DocViewer	1.1.1	YES	
Compatibility Software	1.0	YES	Quadra 610 DOS Compatible
Duo Battery Patch	1.0	YES	For Duo 210, 230, 250
Easy Access Ctrl Panel	7.2	YES	
Energy Saver	1.0	YES	Control panel
EtherTalk	2.5.6	YES	Use Network SW Installer 1.4.4
Express Modem**	1.5.5	YES	Control panel for Express Modem, GeoPort
Express Modem Tool**	1.5.3	YES	CTB Extension for Express Modem, GeoPort
Express Modem 14400**	1.0	N/A	AppleTalk Remote Access CCL file
Extension Manager	3.0	YES	
Fax Extension**	1.5.2	YES	PB Modem, Express Modem, GeoPort
Fax Sender**	1.5.2	YES	PB Modem, Express Modem, GeoPort
Fax Terminal**	1.5.2	YES	PB Modem, Express Modem, GeoPort
Fax Viewer**	1.5.2	YES	PB Modem, Express Modem, GeoPort

..TIL17496-Apple_Software-System_7-1_Compatibility_4-97_(TA33540).pdf

Fax Cover**	1.5.2	YES	PB Modem, Express Modem, GeoPort
Font/DA Mover	4.1		Not required, built into System 7.x Finder
GeoPort Extension	1.2	YES	For Quadra and Power Macintosh
GeoPort for Power Mac	1.0.2		Diskette containing GeoPort Software
Hardware System Update	2.0.1	YES	Obsolete-should use System Update v 3.0
HD SC Setup	7.3.1	YES	
HyperCard	2.2	YES	APDA, reseller
HyperCard IIIGS	1.1	N/A	
HyperCard Player	2.2	YES	Bundled with Power Macintosh
HyperMover	1.1	N/A	HyperCard IIIGS
HyperScan	2.0	YES	OneScanner
ImageWriter	7.0.1	YES	
ImageWriter GX	1.0.1	NO	Part of QuickDraw GX
ImageWriter LQ GX	1.0.1	NO	Part of QuickDraw GX
Installer	3.4.3	YES	
Inter*Poll	1.0.1	YES	
ISDN	1.0	YES	APDA
Japanese Language Kit	1.1	YES	(Includes WorldScript II 7.1.1)
LaserWriter	8.1.1	YES	For LaserWriter Pro family
LaserWriter GX	1.0.1	NO	Part of QuickDraw GX
LaserWriter IIIS GX	1.0.1	NO	Part of QuickDraw GX
LaserWriter Pro Energy Star Software			Postscript document
LaserWriter Pro Windows	1.0	N/A	
LaserWriter Utility	7.6.1	YES	LaserWriter Pro family support
LAT	1.1	YES	APDA
LaserWriter Select 300	1.2	YES	Shipped with LaserWriter Select 300

WS 6150/66, 8150/110, and 9150/120: Q & A (3/97)

=====

Article Created: 31 March 1995
Article Reviewed/Updated: 10 March 1997

TOPIC -----

This article answers common questions about the Workgroup Server (WS) 6150/66, 8150/110, and 9150/120.

DISCUSSION -----

General Questions
=====

Question: How are these new Workgroup Servers different from their predecessors?

Answer: Apple's enhanced line of PowerPC-based Workgroup Servers are different from their predecessors (the Workgroup Server 6150, 8150 and 9150) because the new products offer faster processors, high performance CD ROM, larger capacity hard disks, faster AppleShare 4.1 software, new bundled server software, and the new AppleShare Client for Windows.

Question: How much faster are the enhanced Workgroup Servers over their predecessors?

Answer: The enhanced Workgroup Servers offer faster processor speeds than their PowerPC 601 CPU predecessors: The 6150 runs at 66 Mhz, formerly 60 Mhz, the 8150 runs at 110 Mhz, formerly 80 Mhz, and the 9150 runs at 120 Mhz, formerly 80 Mhz. New higher capacity hard disks and quad-speed CD ROM players are available.

Question: What new server software comes with the Workgroup Servers? How much does it cost?

Answer: For Apple customers in the USA, Apple now bundles a server management

tools for the network manager and productivity tools for the network user. For the network manager Server Manager from Santorini, Apple RAID, FileWave from Wave Research, and Retrospect Remote are included. For the network user Now Up To Date, Now Contact and Viper from IT Designs are included. The bundled software, included at no additional cost, brings a great deal of added-value to the Workgroup Server.

Question: What is the future of NuBus equipped Workgroup Servers?

Answer: Apple is building Workgroup Servers today to use the NuBus bus architecture to allow Workgroup Server customers to plug-and-play any of the hundreds of NuBus-based expansion options, including network interface adapters, WAN connectivity solutions, and publishing-related peripherals. As part of Apple's commitment to improve the performance of the server line, future Workgroup Servers will come equipped with the new high-performance PCI (Peripheral Connect Interface) bus adaptor. PCI-based expansion options are expected to offer throughput several times faster than equivalent NuBus-based cards. Apple will continue to sell NuBus-based Workgroup Servers as long as customers demand.

Vision Questions

=====

Question: What is the compelling difference between a Workgroup Server and a Macintosh?

Answer: In the early 1990's Apple found that workgroups increasingly needed sophisticated network-based features to get their work done although they did not necessarily have an experienced network manager to run the workgroup's network. Apple Business Systems built a business around the Workgroup Server product family to deliver inexpensive servers that are easy to use and administer while offering high performance processors with high capacity disks, high reliability from bundled hardware (RAID, DAT Tape Backup) and software (Retrospect Remote), lifetime comprehensive customer technical support, and valuable bundled network management and client software. These features offer a compelling difference between a Workgroup Server as a network solution for workgroups and Macintosh for desktop computing.

Question: Will a Workgroup Server support services beyond those running on AppleTalk, such as IPX and TCP/IP?

Answer: Network managers in workgroups needing easy-to-manage network solutions may believe that they have to choose between TCP/IP, IPX or AppleTalk solutions. Ethernet or Token Ring networks allow TCP/IP, IPX and AppleTalk network transport protocols to coexist beautifully on the same network. AppleTalk-based network products and technologies are the easiest to use of any network standard. Apple customers find a whole industry devoted to delivering a wide range of supporting AppleTalk-based network products, such as routers, hubs, and network adapters. Consequently, Apple Workgroup Servers play an important part in providing workgroups with solutions that make use of the AppleTalk, TCP/IP

and IPX network transport protocols. Workgroup Servers can speak all of these protocols to enable server applications to serve Macintosh and Windows users using any or all of the network protocols.

Question: How long will it be before you introduce even faster or more powerful Workgroup Servers?

Answer: Although Apple continues today to work towards even faster and more powerful Workgroup Servers, Apple customers need a longer selling cycle - usually up to six months - to evaluate and adopt server products over the rapid introduction of new Macintosh desktop systems. Delivery of the new AppleShare 4.1 demonstrates Apple's continued commitment to increase the value and performance of a Workgroup Server.

Question: How will Workgroup Servers provide more valuable services in the future?

Answer: Apple is building new services that deliver sophisticated network features to workgroups using Workgroup Servers. Apple's commitment to Workgroup Server customers will make these new services available at a nominal cost, sometimes at no cost. For example, the new AppleShare 4.1 server software is available to Workgroup Server 6150, 8150, 9150 customers at no cost to the customer. Apple is also working closely with developers to bring their client/server applications onto the PowerPC processor.

Question: Why will Workgroup Servers performance increase in the future?

Answer: Apple is developing optimized operating system technology and faster network application software to enhance the performance of Workgroup Servers. Apple's commitment to Workgroup Server customers will make these new services available at a nominal cost, sometimes at no cost.

Question: Will Microsoft Windows NT for PowerPC be available for Workgroup Servers?

Answer: Apple has made no announcement that Windows NT for PowerPC will be available for Workgroup Servers. Apple continues to evaluate the needs of customers in its core marketplaces.

Question: What products are entering the end of their lives and how will you support those customers?

Answer: Apple supports its customers with logic-board upgrades to Workgroup Servers that are entering the end of their life, including an upgrade from the Workgroup Server 9150/80 (or Quadra 950) to the 9150/120, from the Workgroup Server 8150 to the 8150/110, and from the Workgroup Server 60 or 80 (both 680x0-based servers) to the 6150/66 and 8150/110 respectively. Apple will offer System 7.5 and Apple RAID to Workgroup Server customers wanting to upgrade their

system software for the existing Workgroup Server 6150, 8150 and 9150.

Apple will provide Workgroup Server 60 customers upgrades to the Workgroup Server 6150/60 until demand wanes. There is no upgrade from the Workgroup Server 6150/60 to the 6150/66 because Apple found it was not cost effective considering the small incremental difference in processor performance. However, Workgroup Server 6150/60 customers will see a tremendous performance increase when running the new AppleShare 4.1 software.

Question: What is happening to the Workgroup Server 95? Are you abandoning Unix?

Answer: Apple continues selling and supporting the Workgroup Server 95, the Workgroup Server that runs the A/UX UNIX-based operating system. Apple found that customers purchase the Workgroup Server 95 either as a fast platform to run AppleShare or as a Unix platform running applications such as Oracle7. AppleShare 4.1 on a Locomotion server is now the fastest AppleShare server. In 1994, Apple announced a strategic alliance with IBM under which Apple intends to offer AIX-based servers in the future.

Compatible Equipment Questions =====

Question: Which Windows machines are compatible with the AppleShare Client for Windows?

Answer: The AppleShare Client for Windows software is designed to run on any IBM PC 100% compatible with 80386, 80486 or Pentium processor and 4 MB of RAM, running Windows 3.1, 3.11, and Windows for Workgroups 3.11, equipped with network adaptor cards with NDIS 3.0 and ODI network drivers on ISA, MC, VISA, PCI, PCMCIA and EISA internal buses.

Question: Will the AppleShare Client for Windows run under Windows 95?

Answer: The Windows client software will not install on PCs running prerelease versions of Windows 95. Apple is planning to release a Windows 95 update after Windows 95 finally ships..

Question: Are previous AppleShare clients for Macintosh compatible with the new AppleShare 4.1 server software?

Answer: The new AppleShare 4.1 server software is backwardly compatible with previous versions of the AppleShare client for Macintosh. However, only the new AppleShare 4.1 client used with the new 4.1 server will provide increased performance. The AppleShare 4.1 server software is compatible with the AppleShare Client for Windows 1.0.

Question: Can I run AppleTalk-based network software on the same network as

Netware applications?

Answer: You can run AppleShare using the AppleTalk-protocol, NetWare using the IPX-protocol, Internet services using the TCP/IP-protocol, and others using the same physical network if you are using the Ethernet or Token Ring standards. Modern networks like these let all protocols and services coexist beautifully.

Server Software Bundle Questions

=====

Question: What software is now bundled with the Workgroup Servers?

Answer: Although the bundled software will vary by configuration, geography, market, and reseller, Apple USA customers will find a library of network software for the network manager and the network user. For the network manager Server Manager from Santorini, Apple RAID, FileWave from Wave Research, and Retrospect Remote (bundled only with DAT equipped Workgroup Servers) are included. For the network user Now Up To Date, Now Contact and Viper from IT Designs are included. The software is included at no additional cost.

Question: Is Apple bundling the complete version of each software product? What do these bundled software products offer to customer?

Answer: The bundled software is feature complete, as if the Workgroup Server customer purchased the stand-alone software product, with the following notes:

Apple RAID now provides software RAID level 0 and level 1. RAID level 0 is disk striping does not protect data but will improve disk performance in certain applications by writing data across two or more disks. RAID level 1 protects data by mirroring data to another disk drive. Since disks are vulnerable components, RAID can save customers from disk crashes.

Retrospect Remote supports Macintosh clients. Dantz is working towards a Windows client.

Santorini Server Manager, formerly GraceLan Server Manager from Techworks, comes bundled with AppleShare-based configurations. Server Manager allows a customer to manage their server locally or remotely. Server Manager includes automatic notification via beeper/QuickMail and tools to manage users and groups.

FileWave automates software distribution across the network and helps manage compliance with software license agreements. The bundled FileWave includes a license for 10 clients. Additional client packs are available from Wave Research.

Now Up-To-Date is a server-based calendar that provides scheduling and to-do list management. Now Contact provides network access to contact database and is integrated with Up-To-Date. These products ship with 10 user licenses. Additional client packs are available from Now.

Viper is a client/server application (similar to Apple's internal employee information DA Directory), that provides easy delivery of customer business

information from a database on the server to clients across the network. For example, Viper could provide users with a common directory of employee phone numbers and addresses. The bundled Viper includes a license for 10 clients. Additional client packs are available from IT Designs.

Adobe Acrobat enables platform and application independent document publishing.

Question: How will Apple deliver documentation for the bundled software?

Answer: Apple will deliver the software and product documentation on a CD-ROM with the Workgroup Server. Adobe Acrobat reader will give access to on line documentation such as the Server User Guide and the Apple RAID user guide.

Apple MessagePad: Problem Viewing Consecutive Day Notes (3/95)

Revised: 4/5/95
Security: Everyone

Apple MessagePad: Problem Viewing Consecutive Day Notes (3/95)

=====

Article Created: 31 March 1995

TOPIC -----

I have entered several birthdays as day notes on my Apple MessagePad 120. However, when I select several consecutive days in the calendar that contain some of them, none of them are displayed. If I select the day the day note is created on, the day note is displayed. I'm following the example on page 93 in the 120 MessagePad Handbook.

DISCUSSION -----

The Handbook is not clear. Only, non-repeating day notes can be viewed in this manner.

WORK AROUND

If it is important to view day notes in this way, change the frequency in the day note to "Don't Repeat". Please be aware that these will only occur once after changing this.

Multiple Scan 15 Display: No 512x384 Resolution (3/95)

Revised: 3/31/95
Security: Everyone

Multiple Scan 15 Display: No 512x384 Resolution (3/95)

=====

Article Created: 31 March 1995

TOPIC -----

I want to use the Multiple Scan 15 Display in a resolution of 512x384. I tried using Display Enabler 1.2 and the System 7.5 Update 1.0, however we still cannot get a resolution of 512x384.

DISCUSSION -----

We are not aware of any software that will allow the Multiple Scan 15 Display to correctly display a 512x384 signal. Loading Display Enabler 1.2 or System 7.5 Update 1.0 will not help.

The video signal used by the 512x384 resolution is not compatible with the Multiple Scan 15 Display. This resolution uses a vertical frame rate of 60.15 Hz, and a horizontal line rate of 24.48 kHz. However, the Multiple Scan 15 Display only supports vertical rates from 60 to 75 Hz, and horizontal rates from 31 to 57 kHz. The Multiple Scan 15 monitor cannot display any video signal with a horizontal rate under 31 kHz.

System 7.5: Improper Shutdown Message (3/95)

Revised: 3/31/95
Security: Everyone

System 7.5: Improper Shutdown Message (3/95)

=====

Article Created: 31 March 1995

TOPIC -----

When I see the System 7.5 improper shutdown message dialog box, why does it not include as one of my options "Shutdown via the Special Menu" in the Finder? Is Apple is going to make this menu option command obsolete? Is Apple discouraging the use of Shutdown from the Finder?

DISCUSSION -----

Apple is not discouraging the use of the Shutdown menu item from the Finder's Special menu. We are simply offering system shut down alternatives and allowing the customer to choose the most convenient method to shut down.

At this time, Apple has not made definite plans whether the Shut Down menu item from the Finder's Special menu will be implemented or made obsolete in future System software releases.

LaserWriter Utility: Can't Print Windows PostScript File (4/95)

Revised: 4/3/95
Security: Everyone

LaserWriter Utility: Can't Print Windows PostScript File (4/95)

=====

Article Created: 3 April 1995

TOPIC -----

I saved a Postscript file from Windows and I'm trying to download it to the LaserWriter using the LaserWriter Utility, but the file will not print. Have you heard of this problem?

DISCUSSION -----

The PostScript file does not print because the Windows driver inserts the control character ^D at the beginning and the end of the file. Just delete the hidden control character ^D before "%!" and after "%EOF".

Color StyleWriter 2400: Random Network Printer Selected (4/95)

Revised: 4/3/95
Security: Everyone

Color StyleWriter 2400: Random Network Printer Selected (4/95)

=====

Article Created: 3 April 1995

TOPIC -----

I have four Color StyleWriter 2400 printers on my network. When I send a print job to a printer while it is asleep or busy printing another job, the print job I sent is sent to another printer at random. What causes this?

DISCUSSION -----

You must rename each printer. What you see is normal if the printers are named the same (default is "Color Stylewriter 2400"). If one printer is sleeping or busy it starts printing to one of the other Color StyleWriter 2400 on the network. If the printers have unique names, a standard error message appears indicating that the printer is busy and the file will print soon.

Renaming Your Printer

=====

Step 1

Open the Chooser

Step 2

Click Setup

Step 3

Change the name of the printer in the Name area and click OK.

System 7.5: Out of Memory Error and Shared Printer (4/95)

Revised: 4/3/95
Security: Everyone

System 7.5: Out of Memory Error and Shared Printer (4/95)

Article Created: 3 April 1995

TOPIC -----

A user has a Macintosh LC 575 with 5 MB of RAM and Color StyleWriter Pro shared on a network. They are running System software 7.5 and Microsoft Word 5.1a. This user is getting an "Out of Memory" error when a remote user tries to print. This only happens if Microsoft Word is launched prior to the Print Monitor being launched.

The company's technician says that there is 379K of available memory when Microsoft Word is running. If the user quits Microsoft Word when this problem occurs, then Print Monitor will then launch and print the document in its queue. If Microsoft Word is launched again after this successful print job the problem will not occur for the rest of the day. Any ideas?

DISCUSSION -----

With just Microsoft Word running on the Macintosh LC 575 with 5 MB of RAM, the System software uses 2861k and Microsoft Word uses 2048k. The largest unused block is 102k. Since Print Monitor requires 160k, the Macintosh LC 575 will not print in the background until that much memory is available.

If you quit Microsoft Word on the Macintosh LC 575, Print Monitor will launch, occupying 160k of memory. If you restart Microsoft Word while Print Monitor is running, Microsoft Word will use what is available, approximately 1943k. If you quit Microsoft Word when Print Monitor is no longer running, Microsoft Word will use 2048k and you will encounter the same problem as before.

Microsoft Word does not require the full 2048k for everyday word processing. If you consult the About This Macintosh window while running Microsoft Word, you will see that less than half of the 2048k allocated is actually being used. We recommend that you set the preferred size lower in the Get Info window of Microsoft Word. This will make enough memory available to allow Print Monitor to launch if Microsoft Word is launched first. With 1024k allocated to Microsoft Word, you can do general word processing (such as: spell checking, and so on).

However, Microsoft Word's grammar checking feature will require more than 1024k.

Other workarounds are:

- Upgrade the RAM in the computer to greater than 5 MB
- Turn on Virtual Memory in the Memory control panel
- Decrease the memory allocated to Print Monitor (not recommended)

Install Apple Telecom 2.3.3 on Quadra 660AV, 840AV (3/97)

Revised: 3/13/97
Security: Everyone

Install Apple Telecom 2.3.3 on Quadra 660AV, 840AV (3/97)

Article Created: 3 April 1995
Article Reviewed/Updated: 13 March 1997

TOPIC -----

This article describes installing Apple Telecom 2.3.3 on a Quadra 660AV, 840AV, or Centris 660AV.

DISCUSSION -----

The Quadra 840AV, Quadra 660AV, and Centris 660AV, use a Digital Signal Processor (DSP) to implement GeoPort functionality. The code that runs on the DSP requires Apple to pay a royalty for every GeoPort that is used on one of these systems.

This DSP code is installed by the disks that originally came with the GeoPort for AV Kit, M1694LL/B. In order to comply with the licensing agreement, Apple Telecom 2.3.3 software checks for the presence of the DSP code and only installs an updated version if an old one exists.

If for any reason, you need to install the Apple Telecom software on a clean system, you must first install the software from the disks that came with the GeoPort, then you can upgrade to Apple Telecom 2.3.3.

If a customer has lost their original GeoPort AV disks, they must contact 1-800-SOS-APPL to replace the missing disks.

NOTE: Apple Telecom 3.0 or greater is not supported on these AV systems.

AppleShare Print Server: DOS Jobs and Correct Logging (4/95)

Revised: 4/3/95
Security: Everyone

AppleShare Print Server: DOS Jobs and Correct Logging (4/95)

=====

Article Created: 3 April 1995

TOPIC -----

When I spool print jobs from the DOS Compatibility Card to an AppleShare Print server, the print spooler log does not report the user name. However, print jobs from the Macintosh are logged correctly. How do I get the DOS Compatibility card to log the user's name in the print spooler log?

DISCUSSION -----

As of April, 1995 there is no workaround for this. The Macintosh LaserWriter driver looks for the computer name in the AppleShare name field from the Sharing Setup control panel, and puts it into the PostScript job in a field called %%FOR. The AppleShare Print Server reads this field and reports it in the log when a file is spooled.

The PostScript output from the DOS Compatibility card does not have the %%FOR field therefore, the print spooler has no name to report.

System 7.5 Update: Control Panels & Extensions Not Replaced 3/95

Revised: 4/3/95
Security: Everyone

System 7.5 Update: Control Panels & Extensions Not Replaced 3/95

=====

Article Created: 3 April 1995

TOPIC -----

First Scenario:

A Power Macintosh already had System 7.5 installed and running. In the Extension Manager control panel the Apple Menu Options control panel was disabled. Easy Install option was used to install System 7.5 Update 1.0. But when Extensions Manager is used to turn Apple Menu Options back on, version 1.0 is still installed, not the 1.0.1 version that comes with the update.

Second Scenario:

A Power Macintosh already had System 7.5 installed and running. In the Extension Manager cdev the Apple Menu Options control panel was disabled. Using the Custom Install option, Apple Menu Options control panel portion of System 7.5 Update 1.0 was installed. After restarting, Apple Menu Options is running. But if Extensions Manager is opened, it lists Apple Menu Options twice, and asks if the duplicate should be replaced. It gives no indication of which is the later version.

Nowhere in the Installer or in the Read Me is there a warning about either of these situations.

DISCUSSION -----

This interaction between the Extensions Manager and the System 7.5 Update 1.0 installer is normal (that is; it functions as it was intended to). Before installing System 7.5 Update 1.0, open the Extensions Manager and choose the "System 7.5 only" extension set. This will help to ensure that any disabled extensions are updated, when the System 7.5 Update 1.0 is installed.

Startup Items Won't Load If Initial Item Is Cancelled (4/95)

Revised: 4/3/95
Security: Everyone

Startup Items Won't Load If Initial Item Is Cancelled (4/95)

=====

Article Created: 3 April 1995

TOPIC -----

A customer has an alias to a server, a document, and an application in his Startup Items folder in his System Folder. If he cancels the connection to the server at startup, then the rest of the start up items do not open.

DISCUSSION -----

The behavior the customer is encountering is correct. If an alias to a server is launched from the Startup Items folder, and the user presses the cancel button when asked to connect, the rest of the startup items will not launch.

This behavior is common to the startup items folder, and is not specific to server connections. For example, if a series of startup sounds are placed in the Startup Items folder, and the user presses Command-period to cancel the playback while the first sound is playing, the remaining sounds will not be played.

There are a couple of ways for this customer to work around this behavior. The first is to use AppleShare's server mounting feature. When the customer uses the Chooser to mount a server volume, he should check the box next to the name of the server volume he wants mounted at every startup. Cancelling a password dialog generated by this method will have no effect on the file in the Startup Items folder.

Second, the customer could change the names of the server aliases in his Startup Items folder, so that they appear alphabetically after any other files, such as applications, that must always be loaded.

Third, the customer could use a third-party macro utility, which might be able to use a macro sequence to mount a server volume at startup.

QuickDraw GX: Corrupt Fonts and Error -27,949 (4/95)

=====

Article Created: 3 April 1995

TOPIC -----

I just installed QuickDraw GX and now I get an error -27949 when I print. What's wrong?

DISCUSSION -----

The error you are getting (-27949 internal_font_error) is caused by a corrupted or GX-incompatible font. One way to troubleshoot this error would be as follows:

Step 1

Drag the Fonts folder from the System Folder to the desktop and restart the computer.

Step 2

Try to print the desktop. If successful, go to step 3; if not, perform a clean install of System Software.

Step 3

Move 5-10 fonts back into the System Folder and restart.

Step 4

Try to print the desktop. If successful, repeat steps 3-4; if not, one of the last fonts installed is the problem. Isolate the bad font and remove it.

Once the bad font is found, reinstall a clean copy. If problem persists with the fresh copy of the font, contact the developer of that font for a GX-compatible update.

Macintosh 630 family: Radius Products Compatibility (4/95)

=====

Article Created: 04 April 1995

TOPIC -----

I have just purchased a Performa 630 CD and would like to have the option of connecting a Radius Full Page Display GS display Model #0632 to it.

Is this possible? If so, what cable(s) are required?

DISCUSSION -----

As of this writing, Radius technical support has stated that no Radius products are compatible with the Macintosh 630 family.

The following computers are in the Macintosh 630 family: Performa 630, Performa 635, Performa 636, Performa 637, Performa 638, LC 630, and Quadra 630.

Color StyleWriter 2400: Printer Port In Use Error (9/95)

Article Created: 4 April 1995
Article Reviewed/Updated: 5 September 1995

TOPIC -----

Some Color StyleWriter 2400 customers are receiving a 'Printer Port In Use' or other similar error message when trying to select the printer port. Here are some suggestions for eliminating the problem.

DISCUSSION -----

The 'Printer Port In Use' message indicates that there may be a software conflict that can be easily corrected.

In many cases a software control panel creates this conflict. The LaserWriter Bridge 1.0 and 2.0 software by Sonic Systems is a control panel which is installed with the LaserWriter Select 360 printer software and the Network Software Installer 1.5. The LaserWriter Bridge software is automatically turned 'on' when installed and can prevent the user from selecting the printer port unless AppleTalk is turned off first.

The LaserWriter Bridge software resides in the Control Panels folder and allows a networked LocalTalk device such as the LaserWriter Select 360 to be visible on an Ethernet network. If the LaserWriter Bridge software features are not required then simply turning it off from within the control panel allows the printer port to be used with the Color StyleWriter 2400, Color StyleWriter Pro, StyleWriter II, and other serial based printers.

AppleCD 600e: Technical Specifications (7/95)

=====

Article Created: 3 April 1995
Article Reviewed/Updated: 25 July 1995

TOPIC -----

This article contains the technical specifications for the AppleCD 600e

DISCUSSION -----

The AppleCD 600e is a quad-speed (4x) external CD-ROM drive.

Playback media

8- or 12-cm optical disc (any standard CD-ROM or audio compact disc is compatible.)

Capacity

-Mode 1: 656 MB
-Mode 2: 748 MB

CD-Audio playback

-Maximum playing time: 74 minutes, 42 seconds
-Frequency response: 20 to 20,000 Hz
-Stereo at 44KHz sampling rate

CD-ROM playback characteristics

-Random Seek Time: 167.5 ms
-Random Access Time: less than 200 ms
-Data streaming rate single speed:
 Mode 1 150 KB/sec
 Mode 2 171 KB/sec
-Data streaming rate double speed:
 Mode 1 300 KB/sec

Mode 2 342 KB/sec

-Data streaming rate quad speed:

Mode 1 600 KB/sec

Mode 2 684.4 KB/sec

-SCSI bus transfer rate (over one CD-ROM block): 5.1 MB/sec

-Buffer size: 256 KB

Formats supported

-Multisession Kodak Photo CD

-ISO 9660/High Sierra

-Macintosh HFS

-CD-ROM XA

-CD+G

-CD+MIDI

-Standard audio CD's

CD digital audio data export via SCSI bus

Interfaces

-Two SCSI peripheral 50 pin connectors for connection to the Macintosh and other SCSI devices

-Stereo audio outputs (RCA jacks) for external amplifier or Powered Speakers

-Stereo headphone output port

-Front panel volume control

-Front panel LED busy indicator

Electrical requirements

=====

Power requirements

100-240 volts AC 50/60 Hz, 0.28 A maximum

Operating environment

Temperature: -41° to 104° F (5° to 40° C)

Relative humidity: 5% to 90% noncondensing

Nonoperating environment

Temperature: -22° to 122° F (-30° to 50° C)

Relative humidity: 5% to 90% noncondensing

Size and Weight

Height 2.32 in (5.9 cm)

Width 6.22 in. (15.8 cm)

Depth 13.1 in (32.3 cm)

Weight 5.73 lb (2.60 kg)

System Requirements

=====

- Macintosh Computer with a 68030 @ 25 MHz
- System 7.1 or later

Article Change History:

25 Jul 1995 - Reviewed for technical accuracy.

26 Jun 1995 - Removed CD-I from discussion.

01 Jun 1995 - Added system requirements.

System 7.5 Update 1.0: Why Skip Disk 4? Disk Contents List 4/95

Revised: 4/4/95
Security: Everyone

System 7.5 Update 1.0: Why Skip Disk 4? Disk Contents List 4/95

Article Created: 4 April 1995

TOPIC -----

Can you tell me what pieces of system software are on the fourth disk of the new System 7.5 Update 1.0 disk set?

I have several customers who are concerned that the Installer does not ask for the fourth disk during installation. Although they and I both know that the Installer is smart enough to only ask for what it needs, I would like to calm their concerns about this installation.

DISCUSSION -----

After a little bit of experimentation with the installation diskettes, I have found what each disk contains. I have listed the results at the bottom of this article.

As you can see, most of the information on the fourth disk, "System 7.5 Update 1.0 - 4", pertains to PowerTalk updates with the exception of the Automated AppleScript updates. So, if a user is not using PowerTalk or AppleScript on their system, the Installer is smart enough to know this, hence, it does not ask for the fourth disk.

System 7.5 Update 1.0 Installation Disk Contents

System 7.5 Update 1.0 - 1

Description	Version	Where Installed?
System 7.5 Update	1.0.2	System Folder
Finder	7.5.1	System Folder

PowerBook 500: Method For Best Quality When Recording (4/95)

Revised: 4/5/95
Security: Everyone

PowerBook 500: Method For Best Quality When Recording (4/95)

=====

Article Created: 05 April 1995

TOPIC -----

I'm trying to record a signal from an external CD-ROM to my PowerBook 500 but the record level is quite low. I have selected "Line In" in the Sound control panel but that doesn't help. This even happens when recording beep sounds in the Sound control panel.

DISCUSSION -----

To get the best recording from an external audio source, it is best to use a capable piece of software to do it, preferably software with an "auto gain" feature.

You can use the software you're recording with to amplify the sound after it's been recorded, although this may create some distortion. The Sound control panel does not have an "auto gain" feature so it will not be sufficient to record sounds at the best quality.

Power Macintosh: System 7.5 Update 1.0 and APD 1.1 Issue (5/96)

Revised: 5/27/96
Security: Everyone

Power Macintosh: System 7.5 Update 1.0 and APD 1.1 Issue (5/96)

Article Created: 05 April 1995
Article Reviewed/Updated: 27 May 1996

TOPIC -----

Apple Personal Diagnostics (APD) 1.1 will incorrectly report problems with the logic board on any Power Macintosh with System 7.5 Update 1.0 installed. This problem is fixed in version 1.1.1. All currently shipping APD software is version 1.1.1.

DISCUSSION -----

Beginning April 10, 1995, customers who own a Power Macintosh with System 7.5 Update 1.0 (System 7.5.1) and Apple Personal Diagnostics (APD) 1.1 can order an upgrade to APD 1.1.1 for no charge (no shipping/handling/tax). These customers will be allowed to participate in the existing APD 1.1.1 program.

APD 1.1.1 program details

- Between April 10 and June 30, 1995, customers with a Power Macintosh, System 7.5.1, and APD 1.1 can call the Apple Order Center to order APD 1.1.1 for no charge.
- Customers will be required to provide proof-of-purchase to order.
- This offer is only good in the United States (50 states and DC)
- The software will ship via US Priority Mail.
- Customers can provide an express courier account number to receive the software overnight.

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center's phone number.

Launcher Closes With Close All Windows Command (9/95)

Revised: 9/8/95
Security: Everyone

Launcher Closes With Close All Windows Command (9/95)

=====

Article Created: 5 April 1995
Article Reviewed/Updated: 7 September 1995

TOPIC -----

When you perform the "close all" command (press the Option key and click the Close box) all the windows on your desktop, including the Launcher, close. Is there away to close all except Launcher.

DISCUSSION -----

Since the Launcher is a window, it closes when you perform the "close all" command.

Here are two ways of easily reopening the Launcher and an AppleScript solution:

Create an Alias on the Desktop

You can create an alias of the Launcher on the desktop, which would normally be hidden under the Launcher window when it is open. Any time you close all of the windows, you could then simply double-click the Launcher alias, now visible, and open it again.

Create an Alias in the Apple Menu

You can create an alias to the Launcher and put it in the Apple Menu Items folder in the System Folder. You then easily access it by pulling down the Apple Menu.

AppleScript Solution

If you have System 7.5 and AppleScript, you can create a script to close all windows except Launcher with the following statements:

```
tell application "Finder"
    close (every window whose name is not "Launcher")
```

end tell

Place the saved Applet in the Apple Menu so you can invoke it readily. This Applet does exactly what is desired without having to reopen the Launcher!

This article was published in the "Information Alley":
Volume II, Issue 2, Page 14

Article Change History:

07 Sep 1995 - Added AppleScript workaround.

18 May 1995 - Reworded workaround to clarify; added Info Alley information.

MacX: How To Choose A Missing Font (4/95)

Revised: 4/5/95
Security: Everyone

MacX: How To Choose A Missing Font (4/95)

=====

Article Created: 5 April 1995

TOPIC -----

I've got a client program that works fine on my friend's host, but displays garbled text in MacX. I know I need to load the missing fonts on my Macintosh for MacX, but I don't know which fonts I need because the host computer has about 300 fonts. How do I find out which fonts to copy to my Macintosh?

DISCUSSION -----

Most well designed X clients will support your choice of fonts or document which fonts are required. Program documentation should also explain what fonts are being used by the clients.

If you need to find the name of a font manually, you can use xfontsel, the font display program that comes with most X windows software.

Run xfontsel on the host computer, and use the menus to change fonts until you find the font you are interested in. Locate that font on your host computer, and then transfer the file to your Macintosh. You can then move that font to your Macintosh and install it under the MacX Font Director.

For more information on MacX and fonts, consult Chapter 5 of the "Apple MacX" manual or see the "MacX Users Guide."

LaserWriter Pro 810: HP/UX Configuration (4/95)

Revised: 4/5/95
Security: Everyone

LaserWriter Pro 810: HP/UX Configuration (4/95)

Article Created: 5 April 1995

TOPIC -----

The LaserWriter Pro 810 can print using three types of print jobs: text, PCL, or PostScript. If you plan on using only one type of print job, you can configure your printer directly with SAM, the Hewlett Packard (HP) administration tool. This article describes how to configure a LaserWriter Pro 810 and HP/UX workstation to print using only one print job type either text, or PCL, or PostScript.

DISCUSSION -----

HP/UX and LaserWriter Pro 810 for only one type of print job.

Part 1 - Configure the LaserWriter Pro 810

These instructions assume your LaserWriter Pro 810 has an IP address already assigned.

Step 1

Using the LaserWriter Pro 810 control panel (located on the printer), print the virtual printer list by doing the following:

- 1) Press the "online" button to deactivate the printer temporarily.
- 2) Press the "print status" button to print the printer status pages.
- 3) Press the "online" button to restore the printer to service.

Step 2

Examine the Virtual Printers report (second sheet to print). There will be a virtual printer entry called "lpd." Look for the Interpreter entry, top row, left most column. The different values can be; none, PCL4, or PostScript. The

table below shows the print job type with its corresponding Interpreter entry:

Interpreter entry	Print job
-----	-----
PCL4 or none	Text
PCL4	PCL
PostScript	Postscript

Step 3

If you need to change the Interpreter setting, you must connect to the LaserWriter Pro 810 through either NCP, or Telnet, or the maintenance port. Sign on as the super user, and use the following command:

```
change service lpd <PCL or PostScript>
```

If you want to print text, you should use PCL in the command line.

Step 4

Turn the printer off and back on. Then confirm your changes by again printing the printer status pages as done in step 1.

Part 2 - Configure the HP workstation

=====

- 1) Login as root
 - 2) Run SAM
 - 3) Open "printers and plotters"
 - 4) Open the "printers/plotters" menu
 - 5) Select "actions: add remote printer/plotter"
 - 6) Fill in the fields of "add remote printer window"
 - 7) Printer name: <the local name of the printer the users will see.>
 - 8) Remote system name: <hostname of your printer from DNS or /etc/hosts>
 - 9) Remote printer name: <PASSTHRU or TEXT>
"PASSTHRU" if you are sending postscript, and "TEXT" if you are sending text or PCL.
- NOTE: PASSTHRU or TEXT must be in upper case.
- 10) Click on "remote printer is on a BSD System"

11) Click okay

If you need to print all job types: text, PCL, and Postscript. You will need to configure a virtual printer on the LaserWriter Pro 810 for each, and install the UNIX apprint software that comes with the LaserWriter Pro 810.

LaserWriter 16/600 PS: HP/UX Configuration (4/95)

Revised: 4/5/95
Security: Everyone

LaserWriter 16/600 PS: HP/UX Configuration (4/95)

=====

Article Created: 5 April 1995

TOPIC -----

I want to print to my LaserWriter Pro 16/600 PS from my HP/UX workstation.
How do I configure it?

DISCUSSION -----

The LaserWriter 16/600 PS auto-recognizes text, PCL, or PostScript, and it emulates a Berkley Remote Printing lpd. However, you need to route your text/PCL print jobs to a different remote printer than PostScript.

HP/UX uses SAM, the Hewlett Packard (HP) administration tool, to configure the System V printing facilities. You can use SAM to create two remote printers, one for text/PCL, and the other for PostScript.

Part 1- Configure LaserWriter 16/600 PS

=====

This article assumes your LaserWriter 16/600 PS has an IP address already assigned.

If the configuration switch, located above the Parallel port on the back of the printer, is in the down position no further LaserWriter 16/600 PS configuration is necessary.

If the configuration switch is in the UP position:

- 1) Launch Apple Printer Utility
- 2) Open Communications Configuration category
- 3) Open the Up Switch Position (Custom)

4) Set TCP/IP menu to Autoselect

If you plan to send only text or PCL, you may set the TCP/IP menu to PCL5. If you plan to send only PostScript, you may set the menu to PostScript.

5) Click "Send"

6) Quit from Apple Printer Utility

7) Turn the printer off and back on. Then confirm your changes by reading the test page.

Part 2- configure the HP workstation

=====

You will create one entry for text/PCL and one for PostScript.

1) Login as root

2) Run SAM

3) Open "printers and plotters"

4) Open the "printers/plotters" menu

5) Select "action: add remote printer/plotter"

6) Fill in the fields of "add remote printer window"

7) Printer name: <the local name of the printer the users will see.>

8) Remote system name: <hostname of your printer from DNS or /etc/hosts>

9) Remote printer name: <raw or text>

"raw" if you are sending postscript, and "text" if you are sending text or PCL

NOTE: You must use lower case for raw or text.

10) Click on "remote printer is on a BSD System"

11) Click okay

If you need to create a second remote printer entry, repeat from step 5.

Color StyleWriter 2400: Will Not Print In Color (9/95)

Revised: 9/5/95
Security: Everyone

Color StyleWriter 2400: Will Not Print In Color (9/95)

Article Created: 5 April 1995
Article Reviewed/Updated: 5 September 1995

TOPIC -----

I cannot get my Color StyleWriter 2400 to print in color, it only prints in black and white.

DISCUSSION -----

You should be able to print in color, however if you are using a program that does not support color printing you will not be able to use color. For example, the Grolier's Encyclopedia which is included with certain Performa computers, does not support color printing. So, you should make sure your application supports color printing. You should also make sure you have the print driver configured for color, the color ink cartridge has ink, and the color ink cartridge is properly installed.

In order to determine the cause of the problem perform the following tasks:

1) Generate a test page by powering on the printing and holding the power button until the power light starts to blink. See page 15-16 of the user's manual for more information.

If the test page appears in full color then the printer is working fine.

If the page is normal but the only color is black then the color ink cartridge is not installed in the printer. Install the color ink cartridge for color printing.

If the black sections of the test page appear normal, but the color sections are missing or more of the colors then the color ink tank is either missing or empty.

2) Try printing a simple document that has color in it. Make sure that the user

selects 'Color' instead of 'Grayscale' or 'Black & White' in the print dialog box. If the document doesn't print in color then try printing another color document from a different application. If the inability to print in color is specific to an application, customers should also contact the vendor of that application for assistance.

Note:

This situation can occur with any color printers, including other Apple printers such as the ImageWriter II, Apple Color Printer, Color StyleWriter Pro, Color StyleWriter 2400, or the Color LaserWriter 12/600.

LaserWriter Select 310: No Upgrades to LaserWriter 360 (4/95)

=====

Article Created: 5 April 1995

TOPIC -----

Can I upgrade my LaserWriter Select 310 to the LaserWriter Select 360?

DISCUSSION -----

While the LaserWriter Select 310 and 360 look similar from the outside, internally these printers are very different. They have different I/O boards, controller boards, fuser assemblies, and print engines. While it is possible to replace all these items, it would end up costing more than purchasing a new LaserWriter Select 360.

Addendum to the Macintosh User's Guide
for the Macintosh LC 630 DOS Compatible

This document contains important information about using your Macintosh LC 630 DOS Compatible that is not included in your user's guide.

Contents

- Using the Floppy Drive
- Use of Floppy Disks as Drive Containers
- Startup Folder/Auto-start PC Conflict
- MIDI Transfers Supported on Macintosh Only
- Use of Two Button Mouse
- Using a Flightstick Pro Joystick
- Bypassing the CONFIG.SYS and AUTOEXEC.BAT files
- Installing Corel Draw
- Using Norton Utilities
- Amendments to Appendix E of the Macintosh User's Guide
- Using SAM 4.0
- SAM Intercept v4.0.2 Virus Checking
- Reinstalling DOS/Windows Software - WB.EXE File
- Rebuilding the Desktop
- Using PC Tools Pro 9.0
- Using MWUNDEL
- Using After Dark 3.0
- Using the Serial Port

Using the Floppy Drive

=====

Both PC and Macintosh floppies are automatically mounted when inserted into the floppy drive, in either operating environment. This mounting process takes a few seconds. Macintosh users are familiar with this process; PC users will find that they should wait a few seconds before accessing the data on the floppy disk.

Certain DOS or Windows floppy disk utilities will not work with the DOS Compatibility Card. These utilities attempt to exercise direct control over the floppy drive, which they cannot do, since it is a Macintosh-controlled floppy drive. Instead, Macintosh disk utility applications should be used.

Use of Floppy Disks as Drive Containers

=====

The LC630 DOS Compatible does not support the use of 3.5" floppy disks as drive containers. Floppy disks are intended for data use only.

Startup Folder/Auto-start PC Conflict

=====

When two or more Macintosh applications are included in the Startup folder, be sure that the "Auto-start PC" is not selected in the PC Setup control panel. Under this circumstance you must switch to the PC mode manually and you must switch only after all Macintosh startup applications have finished launching.

MIDI Transfers Supported on Macintosh Only

=====

The LC 630 DOS Compatible does not have the capability of sending and receiving MIDI data through the serial port for DOS and Windows. MIDI data does travel internally on the PC side, but when connected direct for use with a MIDI instrument, no data will transfer. MIDI transfers are fully supported on the Macintosh side.

Use of Two Button Mouse

=====

The standard Apple mouse has no right button and users must press the "extended =" key whenever they intend to use right button functions in one of their PC applications. However, users of a third party programmable mouse or trackball, such as Kensington Turbo Mouse 4.0 or Logitech MouseMan ADB, can use the utilities included with their mouse to map the "extended =" key to the right hand button.

The Kensington Turbo Mouse 4.0 includes two utilities to configure its buttons.

They are: "Turbo Mouse Control 4.0.2" and "Turbo Mouse Basics 4.0.2". "Turbo Mouse Control 4.0.2", an application that requires an extension, does not effectively map the "extended =" key to the right button and should not be used.

"Turbo Mouse Basics 4.0.2", a control panel, correctly maps the "extended =" key to the right button and should be used instead.

Using a Flightstick Pro Joystick

=====

The Flightstick Pro Joystick for the Macintosh triggers the System beep 'Indigo' when entering the DOS environment. It also triggers this sound twice upon bootup. To correct this, remove the Indigo sound from the System file in the Macintosh System Folder.

Bypassing the CONFIG.SYS and AUTOEXEC.BAT files

=====

To bypass these DOS startup files during the boot-up process, press and hold the F5 key (Command-5 on non-extended keyboards) after the memory testing is complete.

Installing Corel Draw

=====

If you allow Corel Draw to update the AUTOEXEC.BAT file, the line:

LH C:\Apple\MacShare

is replaced with the line:

C:\DOS\SHARE.EXE /L:500 /F:5100

If the former line is needed, you should edit the AUTOEXEC.BAT file to add it back.

Using Norton Utilities

=====

If Norton Utilities for the Macintosh v3.0 or v3.1 is being used, the "More Compatible" option should be chosen:

1. Go into Control Panels and Open FileSaver
2. Click More Choices
3. Click Preferences and Update Now
4. Click More Compatible
5. Click Save

Amendments to Appendix E of the Macintosh User's Guide

=====

..TIL17534-LC_630_DOS_Compatibility_Card-Read_Me_4-95_(TA33572).pdf

On page 164 of the Macintosh User's Guide, certain steps may not exactly apply to more recent versions of the Novell Netware Client disk set. For steps 4 through 7 of the procedure in the manual, all that matters is that the following exceptions apply:

The Netware directory is: C:\NWCLIENT

The LASTDRIVE setting in the CONFIG.SYS file is: LASTDRIVE=Z

The AUTOEXEC.BAT file contains the line: CALL C:\NWCLIENT\STARTNET.BAT

And be sure to load the Windows support in the directory where you have loaded Windows.

In steps 5 and 6, the defaults are already preset; you should not be required to edit the CONFIG.SYS file to set the LASTDRIVE setting or the AUTOEXEC.BAT file to add the CALL line.

In steps 8 through 10 of the same procedure:

Step 8 should read "To select the driver for the network board, press return".

The disk required in step 9 is the "DOS Compatibility Installer Disk for PC Environment" disk that came with your computer.

In step 10 select the "Macintosh DOS Compatible Ethernet Adapter" and press return.

In the section entitled "Conserving Memory", you should not need to edit the AUTOEXEC.BAT file. The CALL line should already be included.

Using SAM 4.0

=====

When using SAM 4.0 for the Macintosh with the "Prompt: 'Skip' is the default button" check box selected in the Floppy Drive preferences, inserting a floppy while in the PC environment causes the system to hang. The floppy cannot be accessed nor can the user switch to the Macintosh environment. To avoid this, select the "Always scan" option.

SAM Intercept v4.0.2 Virus Checking

=====

If you have SAM Intercept 4.0.2 running on your LC630 DOS Compatible, and you attempt to mount a drive container on the desktop, the mouse cursor will indicate that you have control when, in fact, you do not. (SAM Intercept is checking the drive container for viruses but has not displayed the spinning "beach ball" cursor.) It takes approximately two minutes to complete the virus scan, after which the LC630 DOS Compatible will function normally. Version 4.0 of SAM Intercept does not exhibit this behavior.

To avoid this delay, turn off the autoscan feature as follows:

1. Launch the SAM Intercept program
2. Select "Scan" in the "Options" menu
3. Deselect the "Scan for known viruses" option.

Reinstalling DOS/Windows Software - WB.EXE File

=====

Should it become necessary for you to re-install the DOS/Windows software, you will also need to install the WB.EXE file for execution when DOS boots. To install WB.EXE on the LC630 DOS Compatible follow these steps from the Macintosh desktop:

Step 1

Select the PCSetup control panel and select "Shut Down PC".

Step 2

Open the PC drive container, located on your internal hard drive, by double clicking the file "PC Drive File".

Step 3

A hard drive icon labeled "PC BOOTDISK" will appear on the desktop. Double click on PC BOOTDISK to open the volume.

Step 4

Insert the disk labeled "DOS Compatibility Installer Disk for PC Environment". Double click on the diskette icon to open the main window and locate the file WB.EXE.

Step 5

Drag it to the folder labeled "Apple".

Step 6

When the Macintosh is finished copying the WB.EXE file, press command-return.

Step 7

When DOS has finished booting, type:

EDIT C:AUTOEXEC.BAT

Step 8

Add the following line to the end of the AUTOEXEC.BAT file:

C:\APPLE\WB.EXE

Step 9

Press option-f to select the file menu.

Step 10

Select the Exit option (using the up-arrow key) and press return.

Step 11

Press return again to save the AUTOEXEC.BAT file and exit the DOS editor.

Step 12

At the DOS prompt type command-return to re-enter the Macintosh desktop.

Step 13

Unmount the PC drive container by dragging the PC BOOTDISK icon to the trash.

Step 14

Select "Shut Down PC" in the PCSetup control panel.

Step 15

Start the PC using the PCSetup control panel or by pressing command-return.

The WB.EXE program runs and exits when DOS boots. It does not stay resident in memory. The WB.EXE program enables the write back mode and prints a string that reads:

"WB.EXE Enable CPU internal cache to Write-Back.", and exits.

Rebuilding the Desktop

=====

If you need to rebuild the Macintosh desktop, you must either wait for the desktop to rebuild while in the Macintosh environment, or switch to the DOS environment and remain there until the rebuild is complete. Switching back to the Macintosh environment during rebuild will cause the Macintosh to crash.

Using PC Tools Pro 9.0

=====

The CPTASK.EXE utility (Central Point Task Manager) is incompatible with the DOS Compatibility Card.

Using MWUNDEL

=====

MWUNDEL does not work on shared folders, so files deleted by the PC in shared folders will not be recoverable. However, files in shared folders can be recovered if they are deleted from the Macintosh. Use a Macintosh utility such as Norton Disk Doctor.

Using After Dark 3.0

=====

Do not use the PC Setup control panel "Switch at Startup" option when using After Dark.

Using the Serial Port

=====

If you are using communications software that uses the serial port, the following are known errors:

- For Procomm, the auto-answer mode does not work.
- For LapLink, transferring files between two machines may not work, especially for large files.

Apple Video Player: Read Me (4/95)

Revised: 4/5/95
Security: Everyone

Apple Video Player: Read Me (4/95)

=====

Article Created: 5 April 1995

TOPIC -----

This article contains the Apple Video Player ReadMe file.

DISCUSSION -----

Important Information About Apple Video Player

=====

This document provides important information about the Apple Video Player software. You may want to print this document and keep it with your manuals. Most of this information is not in the documentation. If you have questions that are not answered in this document, refer to the manuals that came with your computer.

After you finish reading this document, you can close it by clicking the small box at the upper left of the document window, by typing Command-Q, or by selecting Quit from the File menu.

Video Quality

=====

Video viewing and video capture is supported in window sizes of up to 640 x 480 pixels. For the highest-quality video and TV viewing, use the standard video window sizes (Smallest, Normal, or Largest) in Apple Video Player's Windows menu. If you choose to customize the window size (by choosing Other in the Windows menu), the image's resolution may decrease.

In addition, video resolution is optimized when you view the Apple Video Player video window on the monitor connected to the monitor port on your Macintosh. You can drag the video window to a secondary monitor (connected to an expansion card), but the image resolution will decrease.

Hot Key and MacroMedia Director =====

The Apple Video Player application program allows you to use a keyboard shortcut, called a "hot key," to open and quit the program, and to switch between Apple Video Player and any other open programs. However, due to a minor incompatibility problem with MacroMedia Director, the Apple Video Player hot key doesn't work when MacroMedia Director is open.

If you are installing Apple Video Player for the first time, no hot key is defined. You can set one using the Hot Key item in the Setup Menu. If you are replacing a previous version of Apple Video Player, the hot key setting is retained in the Apple Video Player Preferences file.

Closed Captioning =====

If you have a TV tuner card, the Apple Video Player application program can display closed captions for TV channels that provide them. However, in order for closed captions to be visible, the video window size must be set to Normal Size or greater. Also, for best results, networking or printing should not be active when close captioning is selected.

Capturing Movies =====

Likewise, for best results, networking or printing should not be active when you are recording video from either television or an alternate video source. Virtual memory should also be turned off when capturing video for best results.

Forgetting Your Password =====

If you can't remember your password, you may reset the password by removing the Apple Video Player Prefs file. To remove the Apple Video Player Prefs file, quit Apple Video Player and move the Apple Video Player Prefs file to the Trash. The Apple Video Player Prefs file is located in the Preferences folder, which is in the System Folder.

System 7.5 Update 1.0:Quadra 840AV Updated Display Manager 5/95

Revised: 5/4/95
Security: Everyone

System 7.5 Update 1.0:Quadra 840AV Updated Display Manager 5/95

Article Created: 6 April 1995
Article Reviewed/Updated: 4 May 1995

TOPIC -----

In the Technical Note for System 7.5 Update 1.0 it reads, "Display Manager update - Quadra 840AV computers did not remember the resolution a multisync monitor was set to between restarts. The monitor would resync as at 640x480 regardless of the value set by the user."

In the System 7.5 Update 1.0 Read Me file it says, "Quadra 840AV: The updated Display Manager ensures that a multi-sync monitor is set to the correct resolution when you restart the computer."

What changed? Customers are calling with questions, because they have installed the System 7.5 Update 1.0 on their Quadra 840AV, and their Multiple Scan monitors do not switch to the higher resolution any sooner.

DISCUSSION -----

The change referred to in the Technical Note for System 7.5 Update 1.0 and the Update's Read Me file is a little-known and infrequent problem which occurred in System 7.5. This problem prevented some Macintosh Quadra AV systems from switching to resolutions higher than 640x480 under certain conditions.

After releasing System 7.5, some users reported that their Macintosh Quadra 840AV would sometimes end up with a screen resolution of 640x480 after restarting, instead of the resolution they had chosen before restarting.

As reported in the Technical Note for System 7.5 Update 1.0, it appeared as though the Macintosh Quadra 840AV did not remember the chosen screen resolution. In order to fix this problem, a change was made to the display manager. This change was included in Display Enabler 1.2 and System 7.5 Update 1.0.

Installing System 7.5 Update 1.0 will not allow the Quadra 840AV to switch to a higher screen resolution earlier in the startup process.

Apple LocalTalk Bridge: Troubleshooting (3/97)

Revised: 3/6/97
Security: Everyone

Apple LocalTalk Bridge: Troubleshooting (3/97)

Article Created: 6 April 1995
Article Reviewed/Updated: 6 March 1997

TOPIC -----

This article offers some guidelines for handling common problems with the Apple LocalTalk Bridge.

DISCUSSION -----

General Troubleshooting
=====

The bridge computer becomes unresponsive

Each time a LocalTalk device starts up, the Bridge obtains an address (node ID) from the Ethernet or Token Ring network, and assigns that address to the LocalTalk device in order to make the device visible on the extended network. The bridge computer might become unresponsive (it could "hang" or "freeze") if it is unable to acquire the node ID. To fix this problem, the network administrator needs to reconfigure the router to make more node IDs available for the Ethernet or Token Ring segment on which the Bridge is running.

The bridge computer cannot access Token Ring zones

If you install the Apple Internet Router and the Apple LocalTalk Bridge on the same computer, and both are running simultaneously, the bridge computer won't have access to Token Ring zones. To remedy this problem, remove either the router or the Bridge.

Error messages
=====

Macintosh printer port already in use

During startup, there are three ways in which the bridge computer's printer (or serial) port can be in use:

- You set the current AppleTalk port to LocalTalk in the Network control panel.
- You selected EtherTalk or TokenTalk in the Network control panel, but an error occurred while switching to the selected network, so the bridge computer used the default AppleTalk port (LocalTalk) instead.
- You installed a software product that reserves the printer (or serial) port before the LocalTalk Bridge is activated.

In order for the LocalTalk Bridge to work, you need to select either EtherTalk (if the bridge computer is connected to an Ethernet network) or TokenTalk (if the bridge computer is connected to a Token Ring network) in the Network control panel. If you installed software that reserves the printer (or serial) port, you need to deactivate the conflicting software in order for the LocalTalk Bridge to run.

LocalTalk Bridge cannot start because the printer port is in use

Please select another AppleTalk connection in the Network control panel, then try again. The printer port automatically uses LocalTalk Built-In as the network connection. To use the LocalTalk Bridge, you need to select either EtherTalk (if the bridge computer is connected to an Ethernet network) or TokenTalk (if the bridge computer is connected to a Token Ring network) in the Network control panel.

LocalTalk Bridge cannot start because AppleTalk is not active

Please use the Chooser to activate AppleTalk, then restart the Macintosh. AppleTalk must be active on the bridge computer. You turn AppleTalk on by opening the Chooser and clicking the AppleTalk Active button to select it. You may need to restart your computer for the change to take effect.

LocalTalk Bridge requires AppleTalk version 58 or later

Please install AppleTalk version 58 or later, then try again. The LocalTalk Bridge requires AppleTalk version 58.1.5 or greater to function. Reinstalling system software or installing a third-party card (with its accompanying driver software) might also install a version of AppleTalk that is too old for the LocalTalk Bridge. To remedy this problem, reinstall the LocalTalk Bridge software, using the Installer on the Apple LocalTalk Bridge floppy disk.

LocalTalk Bridge cannot continue because of a network number conflict

Please restart the Macintosh. The non-LocalTalk network (Ethernet or Token Ring) can have one or more active routers, and additional routers might become active on the network after the LocalTalk Bridge is turned on. The additional routers might cause the network number conflict. If restarting the bridge computer does not fix the problem, contact your network administrator; the remedy may involve network reconfiguration.

LocalTalk Bridge cannot start because of an AppleTalk error

AppleTalk errors are rare, but may be caused by file or resource corruption. Check that network cables are securely attached and that all devices are properly terminated. If the problem persists, you may need to reinstall system software, then reinstall the LocalTalk Bridge.

LocalTalk Bridge could not obtain a LocalTalk address because all addresses are in use by other network devices

Please contact your network administrator. Try restarting the bridge computer. If restarting does not remedy the problem, contact your network administrator. The remedy may involve reconfiguring the network.

LocalTalk Bridge was unable to start because of an unspecified error

This message occurs if you install the LocalTalk Bridge on a 68000-based Macintosh. The LocalTalk Bridge requires at least a 68020 processor.

Making AppleTalk inactive or switching network connections has stopped LocalTalk Bridge services

Open the Chooser and turn AppleTalk on, then restart the bridge computer.

There is a router or a Macintosh running LocalTalk Bridge software on this LocalTalk network

LocalTalk Bridge cannot run on a LocalTalk network that has a router or another LocalTalk Bridge. You can only use the LocalTalk Bridge on a LocalTalk segment that does not already have an active AppleTalk Internet Router, LaserWriter Bridge, or LocalTalk Bridge. If the LocalTalk Bridge software detects a router or another Bridge on the LocalTalk segment, the LocalTalk Bridge will not start up. This error message also occurs if you install the LocalTalk Bridge on a computer that also has a router installed. In order for the LocalTalk Bridge to run, you need to remove the router software, then reinstall the LocalTalk Bridge.

There is not enough memory available to start LocalTalk Bridge

The LocalTalk Bridge driver requires approximately 70K of RAM to run. You can try removing unnecessary system extensions (programs that start automatically when the computer is turned on) or installing more memory.

Token Ring driver not compatible with MacIPX

The Token Ring driver is not compatible with MacIPX versions 1.1 and older. Contact Novell Technical Support to obtain newer MacIPX software that works with the Token Ring drivers. If you are not using Token Ring, remove the MacIPX Token Ring components.

Power Macintosh 5200/75 LC: Video In/Out Options (1/96)

Revised: 1/8/96
Security: Everyone

Power Macintosh 5200/75 LC: Video In/Out Options (1/96)

Article Created: 06 April 1995
Article Reviewed/Updated: 8 January 1996

TOPIC -----

This article documents video in and out options for the Power Macintosh 5200/75 LC and Performa 5200 series computers.

DISCUSSION -----

Built-in Monitor

The Power Macintosh 5200 uses a built-in 15-inch multi scan monitor as its output display device. The monitor supports three pixel display sizes: 640x480, 800x600, and 824x632. The initial power-on display size is 640x480. The monitor's resolution is switchable on the fly from the Control Panel menu.

Optional Video Mirror

Video on the Power Macintosh 5200/75 LC includes an optional feature called video display mirror output. This feature makes the video information concurrently available to the built-in display and to the external display port. Connection for the video mirroring is made possible by installing the Apple External Video Connector (P/N M4099LL/A) to the logic board using a 22-pin connector. This connector adds a standard DB-15 video port to the back of the Power Macintosh 5200 for connecting an external monitor or LCD panel.

When using video mirroring, the image on the second monitor is the same as that on the built-in monitor. This mode is a very useful tool for presentations, so the presenter and audience see the same thing.

The video mirroring port supports several external monitor sizes: 640x480 14-inch color, 800x600 15-inch multi scan, 640x480 VGA, and 800x600 SVGA.

NOTE:

The Apple 12-inch RGB color monitor (512x384) is not supported on the Apple External Video Connector.

Optional Video Input

The Apple Video In System (p/n M2894LL/C) accepts video from an external source and displays it in a window on the computer's internal display. This is the same card used in the Quadra 630 and LC 630 computers. The card installs in a dedicated slot in the Power Macintosh 5200 LC and adds composite video in, S-video in, and stereo audio in ports to the back of the cpu.

The card accepts the following video formats: NTSC, PAL, and SECAM. The card's AV features are functionally the same as the Macintosh Quadra 660 AV with one exception: the video input card digitizes color video using a digital YUV format, not the 16-bit RGB format used by the Macintosh Quadra 660 AV.

This digitizing technique provides a cleaner picture because it leverages the strength of the transmission signal, the chrominance channel. The standard television signal carries more signal information in the chrominance channel than it carries in the luminance channel.

The Apple Video In System accepts input from external sources, such as a VCR or camcorder, or it can accept input from the optional internal TV tuner.

The default window size used to display the video input picture is 320x240; it can be resized up to 640x480 – full screen on a 14" monitor. Pixel-doubling is used on the large screen to enhance the 320 x 240 pixel image.

Note: The Power Macintosh 5200/75 LC can not display live video from the video input module on monitors larger than 800x600 pixels.

Note: The video input card does not work with all monitors.

The optional Apple Video In System has a separate input connector named the DAV (digital audio/video) connector. The DAV connector makes the digitized data available to a card in the expansion slot – a card such as a video compressor or some other type of video processor card.

Note: The DAV connector on the Video-In card only provides limited functionality. It is not compatible with the Power Macintosh and Quadra AV DAV connector.

Optional TV Tuner

The optional TV tuner is a plug-in module that enables the computer, in conjunction with the video input module, to function as a television receiver with a remote control. The software associated with the TV tuner provides customized channel selection, password protection for disabled channels, frame capture, and video recording as a QuickTime movie. The TV Tuner requires the Video In card to work. The Apple Video/TV System (p/n M2896LL/C) includes both the Video in card (p/n M2894LL/C) and the TV tuner module.

These are the same modules used in the Macintosh Quadra 630 and LC 630 computers. The tuner is available in NTSC, PAL, and SECAM versions.

Features include:

- 181 channel tuner (US version)
- Coaxial antenna connector (F-type for U.S. and Japan, ICE-type for Europe)
- TV picture in a resizable and movable window
- YUV format for improved clarity
- Support for closed caption and teletext
- Software password protection
- Automatic and manual channel programming
- Single remote control for TV and audio CD

Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

Color StyleWriter 2400: Feeds Multiple Sheets of Paper (4/95)

Revised: 4/6/95
Security: Everyone

Color StyleWriter 2400: Feeds Multiple Sheets of Paper (4/95)

=====

Article Created: 6 April 1995

TOPIC -----

Sometimes my Color StyleWriter 2400 picks up multiple sheets of paper when it prints. Why does this happen?

DISCUSSION -----

Overview

=====

Multi-feeds occur when the paper pick-up mechanism pulls multiple sheets of paper out of the sheet feeder and attempts to feed them through the printer. Depending on how many sheets are picked up the printer may experience paper jams or grinding noises if the carriage assembly binds against the extra sheets of paper.

In order to prevent multi-feeds it is important to properly load paper in the Color StyleWriter 2400 sheet feeder. The paper loading procedures are outlined below, and additional information can be found on pages 22-23 of the Color StyleWriter 2400 User's Guide.

- Move the paper select lever located on the right side of the sheet feeder to the correct position for the type of paper being used (envelopes or paper).
- Open the front cover and adjust the internal paper selector lever for the correct printing style and paper type (envelopes or paper). The center position is best for color printing, heavy black ink coverage, and heavier paper.
- Extend the plastic paper support on the sheet feeder so that the paper in the sheet feeder remains flat.
- Do not overload the sheet feeder. The sheet feeder can hold up to 100 sheets of 20 pound paper.

- Adjust the paper guide so that it touches the left edge of the paper. Do not allow the paper to bow out from too much pressure.
- Use only those printing materials that meet the specifications outlined in the user's guide.
- Open the paper output tray.

Apple MessagePad: International Dialing Using Names (4/95)

Revised: 5/19/95
Security: Everyone

Apple MessagePad: International Dialing Using Names (4/95)

=====

Article Created: 6 April 1995
Article Reviewed/Updated: 21 April 1995

TOPIC -----

This article describes how to dial international numbers on the Apple MessagePad using the Names application.

DISCUSSION -----

This tip makes international dialing using the Names application easier, especially if you travel outside your own country.

For example purposes, assume that you are located in Austin, Texas and that you want to call someone in the Apple office in Oslo, Norway.

Step 1

Tap on Extras, then Time Zones.

If the "I'm here" location does not match the country you are in, set your location as explained in the "Apple MessagePad User's" manual. Use the nearest large city if your city is not listed in the Newton. Since you are located in Austin Texas, your MessagePad is set to Dallas, TX.

Step 2

Tap on Extras, Prefs, and Personal, and set your country.

Assume you have selected "USA" from the pop-up list. (If your country appears in the pop-up list, select it from the pop-up, rather than writing it in.)

Step 3

In the Names application, go to the "Show All Info" view.

Step 4

Enter the country's name on the card, even if it does not appear in the pop-up list. Assume you select "Norway" from the pop-up list.

Step 5

Enter the phone number as you would dial it while in that country. Assume you entered "259 1800".

Step 6

Go to "Show Card" or "Show Card & Notes" and tap twice on the phone number.

This brings up the Call Slip. The phone number should appear with the correct international dialing codes. In this example, your Newton shows "011 47 2591800".

If you traveled to Norway you would set your Time Zone to Oslo, and your Personal Prefs to Norway. Tapping twice on the number again from within the Names application produces a Call Slip with "259 1800".

Finder Access Problems With At Ease & Extensions Manager (8/95)

Revised: 8/14/95
Security: Everyone

Finder Access Problems With At Ease & Extensions Manager (8/95)

Article Created: 6 April 1995
Article Reviewed/Updated: 14 August 1995

TOPIC -----

I have a problem controlling my At Ease users now that all of our Macintosh computers are running System 7.5.

When a Macintosh computer is running System software 7.5 and the user holds down the space bar at startup, the Extensions Manager control panel activates. This creates a problem for me because I use At Ease for some measure of system protection in my classroom.

The problem is that opening the Extensions Manager window at startup allows the user to deselect At Ease Startup, thus turning off At Ease. After deselecting At Ease and closing the Extensions Manager window, the computer will boot normally into At Ease until the computer is restarted. When it is restarted it goes right to the Finder. With At Ease disabled the user has complete access to everything. I can't allow this.

How can I prevent my students from getting access to the Finder, yet still run System 7.5 and At Ease?

DISCUSSION -----

The following suggestions are a couple of workarounds you can try:

Remove Extensions Manager From the Control Panels folder

Move the Extensions Manager control panel out of the Control Panels folder. This will prevent the spacebar from activating the Extensions Manager at startup.

Users with access to the Finder, such as yourself, can still open the Extensions Manager and use it without it actually residing in the Control Panel folder. In other words, moving it out of the Control Panel folder will not disable it entirely, it will only disable the spacebar access to it at startup.

Remove Extensions Manager From the Extensions folder

You can also remove the EM Extension itself, which also prevents the spacebar from opening the control panel window at startup. If you do remove the EM Extension, it will no longer be functional. However, At Ease will NOT let users open this control panel even if they have access to other control panels.

NOTE:

The EM extension will be at the top of your Extensions folder list if you are viewing by name. It has an extra space in front of its name so that it will load first, before the other extensions.

This issue is resolved in the At Ease 3.0.

Apple LocalTalk Bridge: Devices on LocalTalk Segment (4/95)

Revised: 4/7/95
Security: Everyone

Apple LocalTalk Bridge: Devices on LocalTalk Segment (4/95)

=====

Article Created: 7 April 1995

TOPIC -----

How many LocalTalk devices can be connected to an Apple LocalTalk Bridge?

DISCUSSION -----

There is no hard limit imposed by the code on the number of devices that can be attached to the LocalTalk segment. However, the number of devices is limited by the LocalTalk network architecture. If the LocalTalk network is properly repeated or bridged, there could be as many as 254 devices attached to the LocalTalk side of the bridge.

NOTE: The LocalTalk bridge will not function if a router is detected on the LocalTalk network.

"Inside AppleTalk, 2nd Edition" states: "The physical characteristics of the LocalTalk twisted-pair cable allow it to reliably support a recommended maximum of 32 devices." So, without a bridge or repeater, the limit is 32 devices.

However, 20 is the recommended number of devices supported when the bridge is also being used as a workstation. For more devices than that the Macintosh should run as a stand-alone bridge, because there will not be enough computing cycles available to process the user's requests in a prompt manner.

Internet Server For WWW: Description (3/96)

Revised: 3/22/96
Security: Everyone

Internet Server For WWW: Description (3/96)

Article Created: 7 April 1995
Article Reviewed/Updated: 22 March 1996

TOPIC -----

This article describes The Apple Internet Server Solution for the World Wide Web.

DISCUSSION -----

The Apple Internet Server Solution is the easiest and most affordable way to establish a presence on the World Wide Web (WWW). It's the perfect solution for organizations in business, education, or publishing that want to make their information widely accessible on the Internet. And it's a cost-effective choice for organizations that want to publish information for internal use in an electronic format so that all employees have easy access to it.

The Internet, and in particular the WWW, is rapidly gaining in popularity, offering individuals and organizations unparalleled opportunities to get their messages out to the world. The Apple Internet Server Solution is a "WWW server in a box", an all- in-one solution that consists of a Workgroup Server and a CD-ROM that contains all of the software you need to establish a presence on the web.

You get WebSTAR server software; PageMill, a ground-breaking WYSIWYG Hypertext Markup Language (HTML) editor that makes it easy to create a web page; Netscape Navigator client software; RealAudio Server, a web-based audio broadcasting system; and MacDNS domain name server software. You also get NetCloak, a powerful addition to your web server that lets you create dynamic web pages accessible by any browser, and ServerStat to analyze WebSTAR traffic reports.

In addition, the CD-ROM includes AppleSearch and AppleSearch CGI, Adobe Acrobat Pro, Image Maps and Electronic Mail Common Gateway Interfaces (CGIs), and customizable web pages and forms.

With MacDNS, multiple redundant Workgroup Servers can act as one web server to

handle exceptionally high traffic as your site gains popularity. This scalability is quite cost-effective because you can gradually add more power as you need it.

So if you're looking to get noticed on the WWW affordably and easily, but with an eye toward future expansion, the Apple Internet Server Solution is the perfect choice.

Features

Affordability

- Is the lowest-cost World Wide Web server available today

Ease of use

- Includes all of the software tools you need to establish a presence on the web
- Installs with a single click of the mouse
- Gets you up and running in minutes
- Comes with examples and templates to let you create interactive web pages quickly
- Requires no knowledge of UNIX
- Lets you create interactive web pages using Common Gateway Interfaces (CGIs) without complex C programming

Performance and scalability

- Features the high-performance PowerPC processor
- Includes an enhanced networking architecture to optimize your servers performance

Security and reliability

- Is one of the most secure web servers available right out of the box
- Requires no user-installed security patches
- Recovers quickly and easily from power outages

Compatibility

- Lets you create web pages that are accessible to Windows, UNIX, Apple MessagePad, and Mac OS clients

Internet Server For WWW: Details (3/96)

Article Created: 7 April 1995
Article Reviewed/Updated: 22 March 1996

TOPIC -----

This article provides product details and ordering information on the Apple Internet Server Solution For The World Wide Web.

DISCUSSION -----

Product Details
=====

Server Hardware Options

Workgroup Server 7250/120
• See specifications for M4337LL/A below

Workgroup Server 8550/132
• See specifications for M4341LL/A below

Bundled Apple Internet Server Solution Software

Installer
• One button installs all of the included software and templates

WebSTAR from StarNine
• Allows the Workgroup Server to serve information on the WWW
• Comes with sample web pages that can be customized
• Includes on-line documentation and support
• Supports AppleScript scripting, so you can create web pages that interact with other applications that support AppleScript

Adobe PageMill
• Makes creating web pages an easy, graphical process
• Includes tools to create form-based pages for collecting information

from site visitors

MacDNS from Apple

- Maps an IP address to a recognizable web server name (which enables web clients to find your server)
- Tells other domain name servers your web server's name when asked
- Enables dynamic load balancing over multiple servers (with RAIC)

NetCloak from Maxum Development

- Provides additional capabilities to HTML standards
- Improves security, simplifies server development and maintenance, and controls the appearance of pages to individual clients

ServerStat from Kitchen Sink Software

- Helps you manage your server efficiently by analyzing WebSTAR traffic reports

RealAudio Server from Progressive Networks

- Lets you enhance your web pages with high-quality sound

HyperCard from Apple

- A popular software erector set that is easily customized to perform a variety of tasks, such as serving as a multimedia database
- Includes HyperCard CGI

FileMaker from Claris*

- An easy-to-use, yet powerful flat-file database
- Includes FileMaker Pro CGI

EveryWare Tango and Butler SQL*

- Powerful web database solutions
- Includes solutions for on-line conferencing, catalogs, registration, and classified ads

Netscape Navigator client

- Allows you to preview your web pages before you post them

BBEdit from Bare Bones Software

- A high-performance text editor for advanced HTML coding

Adobe Acrobat Pro

- Creates and translates documents into portable document format (PDF), the cross-platform Internet document standard
- Includes Adobe Acrobat Client software

Image Map software

- Creates hotspots in GIF or PICT graphics to incorporate into web pages
- Includes a CGI to serve the image map

Electronic Mail CGI

- Gives e-mail capability to web browsers that do not have it

Sample web pages

- Offer templates of web pages that you can easily customize to suit your needs, including home pages, a catalog page, and forms

AppleScript

- Lets you take advantage of the power of scripting with-out requiring a knowledge of C programming
- Includes useful scripting additions

AppleSearch 1.5

- Enables you to index documents on local servers or in a database and search them by key words
- Includes AppleSearch CGI, which extends AppleSearch text searching and retrieval functionality to web clients

* Does not include complete application package.

Ordering Information

=====

Apple Internet Server Solution for the World Wide Web 7250/120

Order No. M4337LL/A

- Workgroup Server 7250/120 featuring a 120-MHz PowerPC 601 processor, 16MB of RAM, an internal 1.2GB hard disk drive, and an internal quadruple-speed CD-ROM player
- CD-ROM bundle containing all of the Internet software and examples described in Product Details, as well as Apple RAID Software and AppleShare Client for Windows

Apple Internet Server Solution for the World Wide Web 8550/132

Order No. M4341LL/A

- Workgroup Server 8550/132 featuring a 132-MHz PowerPC 604 processor, 24MB of RAM, an internal 2GB hard disk drive, and an internal quadruple-speed CD-ROM player
- CD-ROM bundle containing all of the Internet software and examples described in Product Details, as well as Apple RAID Software and AppleShare Client for Windows

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

StyleWriter 1200: Technical Specifications (12/95)

Revised: 12/4/95
Security: Everyone

StyleWriter 1200: Technical Specifications (12/95)

=====

Article Created: 7 April 1995
Article Reviewed/Updated: 4 December 1995

TOPIC -----

This article contains the technical specifications of the Apple StyleWriter 1200 printer.

DISCUSSION -----

General Specifications
=====

Marking Engine

Thermal ink-jet engine

Resolution

Best: 720x360 dpi (edge smoothing, black and white printing)
. 360x360 dpi (gray printing)
Normal: 360x360 dpi
Draft: 180x180 dpi

The resolution for graphics and text differs according to the quality of printing you select. It is expressed in horizontal by vertical dots per inch (dpi).

Engine Speed

Printing speed depends on the images you print, the options you select, and on the Macintosh computer you use.

Connector Cable

Apple System/Peripheral-8 cable

Interface

High-speed serial (RS-422)

Fonts

- TrueType font support
- 64 TrueType fonts available, consisting of the 43 that come with the StyleWriter 1200 and the 21 that come with the Macintosh system software.
- Adobe PostScript font support when used with Adobe Type Manger (ATM) software. (Sold separately by Adobe Systems, Incorporated).

Sheet Feeder

Holds up to 100 sheets of 20-pound (75 grams/meter²) paper or 15 envelopes.

Printing Materials, Weights in pounds (lb.) and grams/meter² (g/m²)

Plain Paper: Use 16-lb. (60-g/m²) to 24-lb. (90-g/m²) paper.

- Accepts most letterhead and colored stock.
- Accepts medium-weight sheets of labels.
- Use #6 or #10 envelopes.
- You can also use glossy and premium coated paper and back-print film especially designed for StyleWriter printers.
- For fast drying time on overhead transparencies, Apple recommends ink jet transparencies especially designed for StyleWriter printers.

Paper Sizes in millimeters (mm) and inches (in.)

U.S. Letter:	215.9 x 279.4 mm	(8.5 x 11-in.)
U.S. Legal:	215.9 x 355.6 mm	(8.5 x 14-in.)
A4:	210.0 x 297.0 mm	(8.3 x 11.7-in.)
Executive:	184.15 x 266.7 mm	(7.25 x 10.5-in.)
#6 envelopes:	165.1 x 92.1 mm	(6.5 x 3.625-in.)
#10 envelopes:	241.3 x 104.7 mm	(9.5 x 4.125-in.)

Printable Area in millimeters (mm) and inches (in.)

Maximum printable line: 203.2 mm (8.0-in.)

Minimum margins:

- Left and right: 6.35 mm (0.25-in.)
- Top: 5 mm (0.2-in.)
- Bottom: 10 mm (0.39-in.)

Printer Dimension in millimeters (mm) and inches (in.)

Height (paper support down): 180 mm (7-in.)

Width: 345 mm (13.6-in.)

Depth (output tray closed) 200 mm (7.9-in.)

Printer Weight

Approximately 3 kilograms (6.6 pounds)

Operating Environment

=====

Temperature

15 to 30 degrees C (59 to 86 degrees F)

Relative Humidity

10 to 80 percent, noncondensing

Storage Environment

=====

Temperature

0 to 35 degrees C (32 to 95 degrees F)

Humidity

5 to 95 percent, noncondensing

Power

=====

Operating

32 Watts maximum

Input Electrical Requirements

The electrical requirements vary depending on the country for which your model was manufactured:

U.S./Japan: 100-120 VAC, 50-60Hz, 1.0 A*

Europe/Australia: 220 to 240 VAC, 50 Hz, 0.5 A

System Requirements

=====

- The StyleWriter 1200 is compatible with all Power Macintosh, PowerBook, and Macintosh computers with 68020 microprocessors or greater. The following computers are NOT compatible with the StyleWriter 1200:

- . 128K Macintosh
- . 512K Macintosh
- . 512Ke Macintosh
- . Macintosh Plus

- . Macintosh SE
- . Macintosh Classic
- . Macintosh Portable
- . PowerBook 100

- System software version 7.1 or later version
- At least 4MB of RAM (random-access memory)
- Some space on your hard disk (during the installation the tells you if you need more space)

Apple Part Numbers

=====

Printer

Apple StyleWriter 1200: M3886LL

Ink Cartridges

StyleWriter Black Ink Cartridge: M8041G

Connector Cables

Apple System/Peripheral-8 cable: M0197LL

Printing Materials

Though the labels for some of these materials may state that they are for color StyleWriter printers, they also work well with the StyleWriter 1200.

Letter-size transparency: M2658G
Letter-size premium paper: M2952G
Letter-size glossy paper: M3655G
Letter-size back-print film: M2953G
A4-size transparency: M1959G
A4-size premium paper: M2951G
A4-size glossy paper: M3656G
A4-size back-print film: M2954G

*NOTE: The Input Electrical Requirements specified in the manual are incorrect.

Article Change History:

04 Dec 1995 - Removed keyword.
06 Jul 1995 - Added keyword.
22 Jun 1995 - Corrected electrical requirements information

Apple Token Ring NB/c Card: LED States (4/95)

Revised: 4/7/95
Security: Everyone

Apple Token Ring NB/c Card: LED States (4/95)

=====

Article Created: 7 April 1995

TOPIC -----

This article describes how to determine the state of the Token Ring NB/c card by the state of the LED (light-emitting diode) on the card.

DISCUSSION -----

The LED on the Token Ring NB/c Card upon power-up or any type of reset, will clear, indicating that the card is off-line. If the card is set for 16 Mbps (megabits per second) and you have a good network connection, the LED will be green. If the card is set for 4 Mbps, the LED will be yellow/orange. If the LED is not on, or is not showing the correct color, check the guidelines for handling common problems in "Troubleshooting" in the "Apple Token Ring NB/c Card User's Guide."

LaserWriter 16/600 PS: Configuration Switch Settings (4/95)

Revised: 4/10/95
Security: Everyone

LaserWriter 16/600 PS: Configuration Switch Settings (4/95)

=====

Article Created: 10 April 1995

TOPIC -----

What is the purpose of the two position configuration switch located on the LaserWriter 16/600 PS?

DISCUSSION -----

The configuration switch on the LaserWriter 16/600 PS printer provides flexibility in configuring the LocalTalk, Ethernet, and Parallel ports. When the switch is in the DOWN position all of the ports are placed in a default configuration which cannot be modified. When the switch is in the UP position the printer uses the custom communication settings that have been configured using the Apple Printer Utility. Allowing both a custom and a default switch position insures that the user will always have communication access to the printer even if the user makes modifications in the custom mode which prevents communication with the printer.

In the default mode (DOWN) the communication ports are configured as follows:

Communication Port	Mode
=====	====
LocalTalk Port:	PostScript
Ethernet Port:	
. EtherTalk:	PostScript
. NetWare:	AutoSelect
. TCP/IP:	AutoSelect
Parallel Port:	
. Speed:	Fast
. Protocol:	Raw

In the custom mode (UP) the communication ports can be configured as follows:

Communication Port =====	Mode =====
LocalTalk Port:	PostScript*
Ethernet Port:	
. EtherTalk:	PostScript*, Off
. NetWare:	PostScript*, PCL5, AutoSelect, Off
. TCP/IP:	PostScript*, PCL5, AutoSelect, Off
Parallel Port:	PostScript*, PCL5, AutoSelect
. Speed:	Fast*, Compatible
. Protocol:	Normal*, Raw, Binary, TBCP

Note:

An asterisk '*' denotes the default values for the custom mode.

For more detailed information consult the LaserWriter 16/600 PS User's Guide.

Internet Server For WWW: Documentation (1/96)

Revised: 1/3/96
Security: Everyone

Internet Server For WWW: Documentation (1/96)

=====

Article Created: 10 April 1995
Article Reviewed/Updated: 3 January 1996

TOPIC -----

This article describes the documentation on the CD-ROM included with the Apple Internet Server Solution for the World Wide Web.

DISCUSSION -----

Most CD-ROM software is fully documented. The applications come with electronic versions of their standard documentation. Some of the applications, have had their documentation edited and expanded for this release

Documentation for the Internet Server Solution will be in one of two formats:

HyperText Markup Language (HTML) or Adobe Acrobat (PDF)

HTML documentation can be read through Netscape with the "Open File" command. Netscape is automatically configured to point to the "Apple Internet Server Solution"

file//:<Name of drive>/Applications/WebSTAR/HTMLpages/docs/Welcome.html)

This page has a link "Online Documentation" that points to a page that refers to all documentation.

The following documentation is in HTML format and can be viewed by browsing the pages with Netscape:

Some documentation is stored in Portable Document Format (pdf) and requires the installation of Adobe Acrobat Reader or Exchange. The documents are referenced with HTML links, which triggers the launching of Reader or Exchange:

Widgets documentation
Adobe Acrobat 2.1
Applesearch Server

Applesearch Client
Webmaster

The CD-ROM contains the following software:

- WebStar server software
- BBEdit - a hypertext markup language (HTML) editor
- Netscape client software
- Domain Name Server (DNS) software for the Mac OS
- HyperCard software and sample data*
- FileMaker Pro software and sample data*
- Butler SQL software and sample data*
- AppleSearch 1.5 and AppleSearch CGI
- Adobe Acrobat Pro
- Clickable Maps and Electronic Mail Common Gateway Interfaces (CGIs)
- Web "page" that points to a number of client helper applications
- Customizable Web pages and forms.

* Does not include complete application package. Software allows users to modify data, but not the structure of the database.

Article Change History:

03 Jan 1996 - Corrected server software.

12 Jul 1995 - Changed title for consistency, added documentation link paths.

LaserWriter Select 360 Fax Card Outside The U.S.A. (4/95)

Revised: 4/10/95
Security: Everyone

LaserWriter Select 360 Fax Card Outside The U.S.A. (4/95)

=====

Article Created: 10 April 1995

TOPIC -----

I live in the U.K. and I have a LaserWriter Select 360. The Fax card is not available here, and I would like to know if the Select 360 Fax card that is sold in the U.S. will work here?

Can I get information on what countries the Fax card is support? Also, is there any reason why the Fax cards are not available in certain countries?

DISCUSSION -----

The LaserWriter Select 360 and LaserWriter Pro 810 Fax cards are FCC compliant in the U.S. and Canada only. Therefore, they are not legally usable elsewhere because they have only been "certified" for the U.S. and Canada.

Certification by the equivalent FCC organization in the countries, in addition to providing hardware such as DAAs (Data Access Arrangements) to match the country's physical phone jacks, are the limiting factors to making the cards available to all countries.

System 7.5 Update 1.0: Incompatible w/Stuffit SpaceSaver (4/95)

Revised: 4/10/95
Security: Everyone

System 7.5 Update 1.0: Incompatible w/Stuffit SpaceSaver (4/95)

=====

Article Created: 10 April 1995

TOPIC -----

If the Stuffit SpaceSaver control panel does not load before General Controls, users may not be able to see all the files on a mounted file server; only a small percentage of files will appear in the Finder.

DISCUSSION -----

Aladdin Systems, Inc., the creator of Stuffit, has recognized an issue involving their software, Stuffit SpaceSaver, and the Apple General Controls control panel (ver 7.5.3), which is the version included with System 7.5 Update 1.0.

To fix the problem, you can force the Stuffit SpaceSaver control panel to load before General Controls by inserting a blank space or other character in its filename as the first character. (For example, any letter prior to "g" in the alphabet would work in this case). This will cause Stuffit SpaceSaver to load before General Controls because control panels load in alphabetical order.

Removing either the SpaceSaver control panel or General Controls control panel also resolves the issue.

NOTE:

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor, Aladdin Systems, Inc., for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

ColorSync 2.0: Older Profiles Not Compatible (8/95)

Revised: 8/24/95
Security: Everyone

ColorSync 2.0: Older Profiles Not Compatible (8/95)

Article Created: 11 April 1995
Article Reviewed/Updated: 24 August 1995

TOPIC -----

I just upgraded to ColorSync 2.0 on my Macintosh. My third-party monitor came with a ColorSync Profile and has been working fine. After installing ColorSync 2.0, that profile does not seem to be working.

DISCUSSION -----

ColorSync 1.x Profiles are not compatible with ColorSync 2.0. You need to get a new profile from your display's manufacturer in order to use ColorSync 2.0.

You may be able to substitute one of the other Apple profiles until then. You should first check with the manufacturer of your display.

Article Change History:

24 Aug 1995 - Revised to apply to third party displays only.
24 Apr 1995 - Added information on availability of new profiles.

Power Macintosh AV: TV Output In Black & White (4/95)

Revised: 4/11/95
Security: Everyone

Power Macintosh AV: TV Output In Black & White (4/95)

=====

Article Created: 11 April 1995

TOPIC -----

I have a Power Macintosh with an AV card installed and I can only get a black and white signal from the AV card to the television. Why?

DISCUSSION -----

You need to switch the S-Video adapter cables around. You are using the S-Video adapter cable designed for the input signal on the output of the Power Macintosh AV card. If you examine the adapter cables, one is marked IN and the other is marked OUT. You can only get a color signal when you use the OUT adapter on the output of the AV card.

This symptom appears only on Power Macintosh AV computers and not Quadra AV computers since the Quadra AV card has a composite output source instead of the S-Video adapter cables.

Color StyleWriter 2400: Difficulty Installing Cartridge (4/95)

Revised: 4/11/95
Security: Everyone

Color StyleWriter 2400: Difficulty Installing Cartridge (4/95)

=====

Article Created: 11 April 1995

TOPIC -----

I find that replacing the ink cartridges on my Color StyleWriter 2400 difficult because the carrier assembly is not automatically moving to the center position where it can be easily accessed. What am I doing wrong and how can it be corrected?

DISCUSSION -----

Under normal conditions, whenever the front cover is opened and the power is 'on', the Color StyleWriter 2400 moves the carrier assembly to the center position for easy ink cartridge replacement.

Printers which power up with the error LED on (solid LED), keep the carrier assembly in the home position (the right side of the printer) making ink cartridge access difficult.

In the event that the carrier assembly does not move to the center position, power down the printer and gently move the carrier to the center position. Next, check the ink cartridge to make sure it was properly installed and there are no obstructions preventing movement of the carrier assembly. If the problem persists then contact a service provider for further assistance.

Additional ink cartridge replacement information can be found on pages 42-45 of the Color StyleWriter 2400 User's Guide.

Places That Do Not Observe Daylight Savings Time (4/95)

Revised: 4/11/95
Security: Everyone

Places That Do Not Observe Daylight Savings Time (4/95)

=====

Article Created: 11 April 1995

TOPIC -----

I have a PowerBook 520c which is running System 7.5. I set the Date & Time control panel to Honolulu, with no Daylight Savings time (because Hawaii does not use Daylight Savings time).

When I open the Map control panel, and type in Los Angeles, the time is one hour off; that is, it is only a 2 hour time difference instead of a 3 hour time difference.

It seems like the Map control panel does not support states that do not use Daylight Savings Time. Is there any way to change this?

DISCUSSION -----

The setting in the Date and Time control panel for Daylight Savings time is a universal setting. That is, it assumes everybody in the world is observing Daylight Savings time when its checkbox is selected.

If other areas of the world are not observing Daylight Savings time when the checkbox is selected in the Date & Time control panel, then the Map control panel will be off by an hour for all areas that are not recognizing Daylight Savings time.

Conversely, if you set the Map control panel to an area that does not observe Daylight Savings time and deselect/uncheck the checkbox for Daylight Savings time in the Date & Time control panel, then time in all areas celebrating Daylight Savings time will be off by an hour in the Map control panel.

In the case of Hawaiians, sometimes they are three hours behind Pacific Standard Time (PST) and sometimes two hours behind Pacific Daylight Time (PDT). The Map control panel can only calculate differences between time zones relative to Greenwich Mean Time (GMT). Hawaii will always show up as three hours past the Pacific time zone and five hours past the Central time zone.

When Hawaiians are not observing Daylight Savings time, but the rest of the country is, there is no combination of settings in Map and Date & Time control panels which will enable you to display Hawaiian local time correctly AND concurrently display the correct time in other places that do observe Daylight Savings time.

The knowledge about which countries observe Daylight Savings time and which do not is not built into the Map control panel, so it does not allow for such a complex calculation.

This same situation also occurs in other parts of the world besides Hawaii. Phoenix, Arizona is an example of an area of the U.S. which also does not observe Daylight Savings time.

Internet Server For WWW: Getting Started (1/96)

Article Created: 11 April 1995
Article Reviewed/Updated: 3 January 1996

TOPIC -----

This article is a getting started article for Apple Internet Server Solution for the World Wide Web.

DISCUSSION -----

To start learning about and then building your Web server, your first step is to fill out the Installation Checklist and then install and configure all the software you need. Remember, you must have MacTCP installed and running, and have access to an Internet connection to get on the World Wide Web (WWW). Without a connection, you can use the CD, but you cannot go any farther. We provide full MacTCP information, but some of the data you will need to enter is specific to your Internet connection. There are many ways to get an Internet connection. Generally it's obtainable through your network administrator or from a commercial source. It's up to you to find out what you need.

The package contains all the software you need to make a presence on the Internet. However, you must provide the connection to the Internet. If your site does not already have a connection to the Internet, you need to purchase this service from an Internet access provider in your area. Internet access is generally offered in two forms, a dial-up connection through the access provider's server, or a continuous connection through a server at your site. Call your local phone company for the access providers in your area. They will assign you an IP address which you need for the Installation Checklist.

While waiting for an Internet connection, you can get started with the Apple Internet Server Solution for the World Wide Web by opening the sample pages and beginning the process to create the documents you want to publish on the Internet, such as your home page. All the tools necessary to designing and create your home page are on the CD.

Installation Checklist

You must obtain the following information about your network from your network administrator or access provider before proceeding with installation. This information is required to configure MacTCP – the Macintosh version of the TCP/IP networking protocols required by all systems using the Internet.

Get this information:

- IP address
- Gateway address
- Domain Name

A Domain Name maps an Internet address to a name for your site, for example, apple.com. You can type a period (.) in this field and the server will search all IP addresses and use the first one that matches your Internet address.

- Domain Name Server Address (or addresses if there are multiple servers)

You do not need to enter a Class of Address because it is automatically determined from your IP address.

Test Your MacTCP Connection

Test your MacTCP connection to make sure your local host, and hosts and gateways successively farther away are working properly before you enter the Internet. This helps to isolate potential problems. MacTCP Ping is a utility, in the Applications folder on your Internet Server, to help isolate problems.

If you need more information on MacTCP Ping utility, see the "MacTCP Administrator's Guide" on the CD-ROM.

Installation instructions

- 1) Insert the CD-ROM.
- 2) Double click Install Internet Server.
- 3) Click Install to install the applications and documentation. Installation requires a minute or two. All applications are placed in your Applications folder.
- 4) Restart your server. WebStar is launched, along with Netscape which displays the default Home page.

NOTE: If you install the software before configuring MacTCP, you'll see an error message such as "unable to Initialize Network! MacTCP may not be loaded", or when you are using Netscape "Could not create socket, insufficient system resources, or network down." These messages indicate that the applications are unable to reach the Internet and the messages will disappear once MacTCP is configured properly.

Internet Service Providers In The U.S. and Canada (6/96)

=====

Article Created: 11 Apr 1995
Article Reviewed/Updated: 9 April 1997

TOPIC -----

This article provides a list of Internet service providers in the U.S. and Canada.

DISCUSSION -----

Internet Service Common Terms
=====

Below are some terms and definitions to common Internet terms and connection methods:

- Shell
Offers a basic connection running on top of an UNIX environment. Services include electronic mail, Usenet news, FTP, telnet, gopher, IRC, and so on. Most providers have a menu-driven interface as well.
- UUCP
Offers a method for computers to transfer files from machine to machine without user intervention.
- SLIP
Allows computers to be temporarily connected the Internet. You can run services such as FTP and telnet directly from a computer. This also allows you to run some of the popular graphical user interface software (such as Mosaic and other World Wide Web clients).
- PPP
Similar to SLIP but a much better protocol.
- FTP
Offers anonymous FTP space.

- LAN

This is for connecting a local area network to the Internet.

- WWW

Offers space for maintaining Web pages.

- ISDN

High-speed network connections that are offered as dial-up access via digital modems.

- 56-T1

These cover the 56K through T3 speeds. These are dedicated line connections that are high-speed and high-bandwidth.

Internet Service Providers

=====

Internet Service Providers in your local area connect you to an Internet account through a regular phone line. If you choose a local company, you will save money on the long distance charges. This list is not complete, and should not be considered a recommendation from Apple Computer. It is provided for your reference. For a more complete listing, refer to the InterNIC (info@internic.net), PDIAL or Nixpub lists available on ZiffNet/Mac or other online services.

Power Macintosh: SCSI Termination Explained (1/96)

Revised: 1/29/96
Security: Everyone

Power Macintosh: SCSI Termination Explained (1/96)

Article Created: 12 April 1995
Article Reviewed/Updated: 29 January 1996

TOPIC -----

This article explains the differences between the internal SCSI termination on Power Macintosh 8100 series computers and Power Macintosh 7500, 8500, and 9500 series computers.

DISCUSSION -----

Power Macintosh 8100 series and Power Macintosh 7500, 8500, and 9500 series computers have dual-channel asynchronous SCSI interfaces, which results in two separate SCSI buses: an internal/external SCSI bus, Bus 1, and an internal SCSI bus, Bus 0. However, the specifications and configurations of the two buses differ slightly.

Power Macintosh 8100 Series Computers

Bus 1

Bus 1 consists of a 50-pin flat ribbon cable with two 50-pin connectors on the end of the cable. The CD-ROM drive, if installed, occupies the first connector. The second connector has a 50-pin terminator connector installed on it. To add a second SCSI device to Bus 1, you must remove the 50-pin terminator connector and install a terminated SCSI device.

Bus 1 has automatic termination, which means that circuitry on the logic board senses whether or not there are any external SCSI devices attached. If there are no external SCSI devices connected, the logic board automatically terminates itself at the 50-pin logic board connector, thus terminating both ends of the SCSI chain.

Once an external SCSI device is connected to the 25-pin external connector, the circuitry senses the device and disables termination at the 50-pin logic board

connector. The computer then relies on the external SCSI device to provide the proper termination.

Bus 0

Bus 0 is a completely separate SCSI bus with its own SCSI controller. This bus has a 50-pin flat ribbon cable with two 50-pin connectors on it. Power Macintosh 8100 series computers ship with the internal hard drive connected to this SCSI bus. The internal hard drive is terminated, which terminates the SCSI bus.

Unlike Bus 1, Bus 0 does not have automatic termination because it is exclusively an internal SCSI bus. If additional devices are added to Bus 0, only the last device should contain termination resistors.

Power Macintosh 7500, 8500, and 9500 Series Computers

=====

Bus 1

Unlike Bus 1 in Power Macintosh 8100 computers, there are no devices attached internally to Bus 1 in Power Macintosh 7500, 8500, and 9500 series computers.

Bus 1 has automatic termination, which means that circuitry on the logic board senses whether or not there are any external SCSI devices attached. If there are no external SCSI devices connected, the logic board automatically terminates itself at the 50-pin logic board connector, thus terminating both ends of the SCSI chain.

Once an external SCSI device is connected to the 25-pin external connector, the circuitry senses the device and disables termination at the 50-pin logic board connector. The computer then relies on the external SCSI device to provide the proper termination.

Bus 0

Bus 0 is a completely separate SCSI bus with its own SCSI controller. On Power Macintosh 7500, 8500, and 9500 series computers, Bus 0 provides Fast SCSI communications up to 10 MB per second.

This bus has a 50-pin flat ribbon cable with two 50-pin connectors on it. Power Macintosh 7500, 8500, and 9500 series computers ship with the internal hard drive and CD-ROM drive connected to this SCSI bus. The internal hard drive is terminated, which terminates the SCSI bus.

Unlike Bus 1, Bus 0 does not have automatic termination because it is exclusively an internal SCSI bus. If additional devices are added to Bus 0, only the last device should contain termination resistors.

For additional information on dual-channel SCSI or Fast-SCSI in Power Macintosh series computers, see these related Tech Info Library articles:

Power Macintosh AV: Greyscale Output from S-Video Port (4/95)

Revised: 4/12/95
Security: Everyone

Power Macintosh AV: Greyscale Output from S-Video Port (4/95)

=====

Article Created: 12 April 1995

TOPIC -----

I am ouputting video from my Power Macintosh AV to an external video source using the S-Video port. My Monitors control panel is set for 256 colors yet the video appearing on the television monitor is in shades of grey.

Does this indicate a problem with the AV card?

DISCUSSION -----

There are two different S-Video cable adapters provided with the Power Macintosh AV computer. Using the S-Video cable adapter marked IN instead of the adapter marked OUT will produce this problem.

Externally, the adapters look identical except for the IN/OUT markings on the flat part of the connector. Internally, they have different wiring which will cause the loss of color signal.

Workgroup Server 95 Tech Tips: Customers Hear on Hold (4/95)

Revised: 4/12/95
Security: Everyone

Workgroup Server 95 Tech Tips: Customers Hear on Hold (4/95)

=====

Article Created: 12 April 1995

TOPIC -----

These are the Tech Tips that customers calling in with an Apple Workgroup Server question hear while on hold.

DISCUSSION -----

Tech Tip 1: Recovering From A Crash

The following steps can be followed to recover from a crash on a WorkGroup Server 95. Attempting these steps in the order they are given will assure that the least trouble is encountered with the UNIX file system.

First depress Command-Control-E simultaneously and wait for at least one minute before proceeding. Depressing these three keys simultaneously forces a restart of the Macintosh process running within UNIX.

If no response is generated by Command-Control-E, turn the server off using the key switch on its front panel. Turning the key switch counterclockwise to the "off" position sends a signal to the motherboard to perform an orderly shutdown of UNIX processes. As with Command-Control-E, wait at least one minute for this action to complete before assuming it is unsuccessful.

The last resort for restarting the server involves pressing the reset switch on the front of the server.

After any abrupt restart of the server, it is recommended that a manual file system check be performed from the A/UX Startup Shell. Entering the Startup Shell involves restarting the server and clicking the "Cancel" button OR depressing the Command and Period keys when the Dialog Box appears saying "Welcome to the Apple WorkGroup Server...Launching". This will present a command line interface.

At the prompt type the following UNIX command:

```
fsck -y /dev/default
```

This command will perform a file system check of the default boot drive. It may take a few minutes to complete. If upon completion, a message indicating the file system was modified is displayed, it is a good idea to run the same command once more.

If a message indicating the file system was modified is NOT encountered, entering the command:

```
launch
```

will boot the server into its normal operating mode.

Tech Tip 2: Rebuilding the DeskTop

There are two ways to rebuild the desktop on an Apple WorkGroup Server 95: the Apple way and the UNIX way. Both approaches give the same result, but they also bear some explanation.

You may have already discovered that depressing Command and Option simultaneously while booting the server rebuilds the desktop for the MacPartition but not for the UNIX file system. The latter requires holding down the Command and Option keys as the Finder process is loading within A/UX. A simple way to accomplish this is to select LOGOUT from the Special Menu and depressing Command and Option simultaneously as the Finder loads. A dialog box will then appear asking if you want to rebuild the desktop.

The UNIX approach for rebuilding the desktop involves use of the command line interface. Use the rm command to delete each of the four files in /mac/sys/System Folder which include "desktop" in their name. Once these files have been deleted, the Desktop will automatically be rebuilt the next time the Finder loads.

ARA CCL Scripts for GeoPort and Express Modem (4/95)

Revised: 4/12/95
Security: Everyone

ARA CCL Scripts for GeoPort and Express Modem (4/95)

=====

Article Created: 12 April 1995

TOPIC -----

This article describes the preferred modem scripts for Apple Remote Access (ARA) when using the GeoPort Telecom Adapter or Express Modem.

DISCUSSION -----

GeoPort 2.0 Telecom Adapter connection (CCL) scripts

ARA 1.0: GeoPort Telecom ARA 1.x (in Extensions folder in System Folder)

ARA 2.0: GeoPort Telecom ARA 2.x (in Extensions folder in System Folder)

Two additional, optional connection (CCL) files, named GeoPort Telecom ARA 1.x/CNG and GeoPort Telecom ARA 2.x/CNG, are installed as well. When you use them, the GeoPort Telecom Adapter transmits data calling tones after dialing. Data calling tones allow the remote machine to detect automatically that an incoming call is a data modem call. If you are dialing into a system that supports data, fax and voice calls (such as another GeoPort Telecom Adapter) you should select it in the Apple Remote Access Setup control panel.

Note: The GeoPort Telecom ARA 1.x/CNG and GeoPort Telecom ARA 2.x/CNG files are installed in the Telecom Documents folder. Should you decide to use these optional files, you'll need to drag or copy them to the Extensions folder.

Express Modem connection CCL scripts

ARA 1.0: Express Modem 14400

ARA 2.0: Express Modem ARA 2.0 (Modem Documents folder on installer disk)

ARA MultiPort X.25 Extension: CompuServe X.25 Network (4/95)

Revised: 4/12/95
Security: Everyone

ARA MultiPort X.25 Extension: CompuServe X.25 Network (4/95)

=====

Article Created: 10 April 1995

TOPIC -----

I am setting up an Apple Remote Access (ARA) MultiPort X.25 Extension server through CompuServe's X.25 network, and I'm getting a "Could not connect to host" error. What is wrong?

DISCUSSION -----

The key piece of data that is not being provided by CompuServe on the client is an ASCII string that gets placed in the Call Request Packet. The string should be "ARAX25".

The problem is CompuServe sets up their X.25 services in such a way that all their PAD parameters are set up ahead of time. The client logs into the CompuServe network and is authenticated to use a predetermined service. Other X.25 service providers allow the client to issue PAD commands, therefore the scripts for them look very different than the script for CompuServe. As a comparison look in the Sprint CCL script that comes with ARA MultiPort Server X.25 Extension software to see how the "ARAX25" string gets sent to the PAD. In X.25 terminology, the "ARAX25" string goes in the Call User Data field which ends up being the last 6 bytes of the Call Request packet.

MAE 2.0: MacInTax 1994 Cannot Save To Hard Disk (4/95)

Revised: 4/12/95
Security: Everyone

MAE 2.0: MacInTax 1994 Cannot Save To Hard Disk (4/95)

=====

Article Created: 12 April 1995

TOPIC -----

This article describes a workaround when MacInTax initially saves a file to the UNIX hard disk with MAE 2.0.

DISCUSSION -----

Here is a workaround, save the MacInTax file to a floppy disk instead of the hard disk. You can then copy the MacInTax file in the Finder from the floppy disk to the UNIX hard disk.

It appears that MacInTax has a problem creating the file on the hard drive but not a floppy disk. Once the file has been dragged to the hard disk, MacInTax can open and update it without difficulty.

Apple Color Printer: Uneven Margins in Printer Driver (4/95)

Revised: 4/12/95
Security: Everyone

Apple Color Printer: Uneven Margins in Printer Driver (4/95)

=====

Article Created: 12 April 1995

TOPIC -----

When I print from my Apple Color Printer, the top and bottom margins are shifted slightly. How can I correct this?

DISCUSSION -----

When printing from the original Apple Color Printer, the top margin may actually print 1/8-in. less than expected, and the bottom 1/8-in. larger. For example, a margin of 1-in. on all sides may yield a top margin of 7/8-in. and the bottom 1 1/8-in.

The problem is actually with the Apple Color Printer driver. There are no plans to revise the Apple ColorPrinter driver. However, one possible solution is contact GDT Softworks. GDT Softworks makes PowerPrint. PowerPrint contains a newer version of the Apple Color Printer Driver. This may resolve the problem, however Apple does not guarantee this solution).

Another solution would be to adjust for the margin difference through the application being used.

The problem may be more prevalent when printing from Postscript programs.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

QuickTime for Windows: Differences Between 2.0 and 2.0.1 (4/95)

Revised: 5/24/95
Security: Everyone

QuickTime for Windows: Differences Between 2.0 and 2.0.1 (4/95)

=====

Article Created: 12 April 1995

TOPIC -----

This article describes the differences between QuickTime of Windows 2.0 (QTW) and QuickTime for Windows 2.0.1.

DISCUSSION -----

The main difference between 2.0 and 2.0.1 is a QuickTime for Windows 1.x/2.0 installation/compatibility problem that has been fixed. Other problems corrected are:

- 1) Resource leak in sample codec component fixed by extern "C"
- 2) Resource leaks in components based on sample code in (1)
- 3) Data handler performance enhancements
- 4) Installer changes for ATI Mach 64 compatibility
- 5) Installer now removes [video] optimize= key, to ensure that
. auto-video speed determination in QTW is re-enabled for QTW 2.0
- 6) Updated memory utilization for enhanced performance during rate
. conversion/audio decompression
- 7) Updated all components to peacefully coexist with previous versions
. of the quicktime binaries. (Issue resolved for Premiere 1.x, and some
. CD-ROM titles which run QTW binaries from the CD-ROM instead of from
. the default QTW binary)
- 8) Component manager now supports two entry points to identify
. component:
. THNGIDENTIFY
. THNGIDENTIFY2

- . This allows QTW 1.x to safely ignore newer components which use QTW
 - . 2.0 specific features. (see item 7)
- 9) Byte-swap public macros now use 2-byte XCHG instead of 3-byte ROL
- . instruction
- 10) New support for casting an HGLOBAL handle to a PicHandle on all API
- . calls which take a PicHandle as a parameter. This allows a
 - . programmer to read from a file into a Global memory object, then
 - . have QTW interpret the contents of memory as a PICT.
- 11) Correct the usage of CLUTID = -1 to be the same as on Macintosh.
- 12) Added preference to QTW.INI to allow user to indicate that their
- . windows sound driver is lying about its ability to perform volume
 - . control.
- 13) Added preference to QTW.INI to allow QTW to reset the sound hardware
- . everytime the audio output channel is opened.
- 14) Improved audio sync under low memory conditions.
- 15) Improved audio decompression performance.
- 16) NewMovieFromDataFork parsing improved when there are multiple 'moov'
- . resources in the data fork.
- 17) Switching between multiple sound tracks is now supported at runtime
- . under application control.
- 18) Prevent various malformed JPEG images from causing GPF.
- 19) Corrected editlist processing when media timescale was different
- . from movie timescale.
- 20) Bypass more GDI bugs related to SetBitmapBits.

LaserWriter 16/600 PS: Europe Uses a Blacklist Option (4/95)

Revised: 4/13/95
Security: Everyone

LaserWriter 16/600 PS: Europe Uses a Blacklist Option (4/95)

=====

Article Created: 13 April 1995

TOPIC -----

We have a customer in Spain who is experiencing random problems with a LaserWriter 16/600 PS Fax. Sometimes, when trying to send a fax, the error "El teléfono está en una lista negra" which means "The telephone is on a black list" appears. This does not always happen with the same phone number, what is going on?

DISCUSSION -----

"El teléfono está en una lista negra" means that the user has reached the limit for retrying the connection. The maximum number for redialing the same phone number is four. This number is set by the customer's Spanish phone company, and once you have exceeded this number you get the error "this phone number is black listed". You must wait a certain amount of time before trying again.

This code is not often used in Spain; it is more prevalent in other European countries.

IDE Volume Sizes (4/95)

Revised: 4/13/95
Security: Everyone

IDE Volume Sizes (4/95)

=====

Article Created: 13 April 1995

TOPIC -----

What is the largest volume size that the IDE interface, which is used in the PowerBook 150, Macintosh 630-series, and Power Macintosh 5200/75 LC, can support?

Does the IDE interface (ANSI proposal X3T9.2/90-143, Revision 3.1.) have the same limit as the ATA interface specification which I believe is approximately 500 MB, or does this interface support a larger volume size?

DISCUSSION -----

According to Engineering, the IDE interfaces in the PowerBook 150, Macintosh 630-series, and Power Macintosh 5200/75 LC use a built-in driver that works with volume up to 2 GB in size. However, it's important to note that any IDE drive that is going to be used on these systems must support Logical Block Addressing (LBA). LBA is the method that drive manufacturers have adopted in order to go beyond the 520 MB DOS-BIOS limit.

As long as the IDE drives support Logical Block Addressing, it should be possible to install drives larger than 500 MB in these systems.

StyleWriter 1200: Description (4/95)

Revised: 4/14/95
Security: Everyone

StyleWriter 1200: Description (4/95)

=====

Article Created: 14 April 1995

TOPIC -----

This article provides a description of the Apple StyleWriter 1200 printer.

DISCUSSION -----

Features

=====

Outstanding print quality

- Prints extremely high-resolution documents by smoothing the edges of text and line art using 720 by 360 dots per inch for crisp black-and-white pages; prints pages containing gray-scale images at 360 by 360 dots per inch

- Widens your choice of typefaces to 64 scalable TrueType fonts for printing in any size and in a variety of styles

Convenience

- Takes advantage of the high performance of PowerPC processor-based computers to speed the processing and printing of complex documents

- Features a small, sleek design that fits on virtually any desktop

- Prints quickly (three pages per minute in black-and-white normal mode)

- Offers the option of printing on a wide range of media, including plain paper, transparencies, glossy and premium paper, back-print film, and envelopes

- Takes advantage of built-in GrayShare technology to enable printer sharing over a variety of networks

- Turns itself on automatically when it receives a document and turns itself off when it finishes printing

Ease of use

- Supports plug-and-play connection to any Macintosh with a 68020 or above microprocessor—or PowerBook or Power Macintosh—computer
- Installs easily, in a single step
- Provides "desktop printing"; you can print files by simply dragging them onto a desktop printer icon
- Allows you to place watermarks in the background of your documents quickly and easily
- Lets you print two or four reduced-size pages on a single sheet of paper for fast and easy document review

Description

=====

The Apple StyleWriter 1200 offers the convenience of laser-quality printing right from your desktop. This ink-jet printer is perfect for home, education, and small-business users who require high-quality text and graphics at an affordable price.

Designed to fit easily into even the smallest of work spaces, the Apple StyleWriter 1200 provides a convenient, quiet, personal printing option—but one with advanced features. It produces output with impressive quality, offering 720- by 360-dpi resolution for edge smoothing on black-and-white pages and 360- by 360-dpi resolution on pages containing gray-scale images. And it prints quickly—three pages per minute for black-and-white pages in normal mode.

To support its outstanding performance, the Apple StyleWriter 1200 uses GrayShare, an Apple technology that offers gray-scale printing capabilities. GrayShare also allows you to share your StyleWriter 1200 over a variety of networks, making this printer an economical option for a small workgroup.

In addition to performance, the Apple StyleWriter 1200 also rates high on convenience and flexibility. It offers plug-and-play connection to virtually any Macintosh computer and installs easily, in a single step. For flexible printing options, the StyleWriter 1200 printer offers 64 TrueType fonts that provide you with a wide range of type styles and sizes. And it can print easily not only on plain paper but also on a wide range of media, including glossy and premium paper, envelopes, transparencies, and back-print film.

So if you want simplicity coupled with quality--all at an affordable price--the StyleWriter 1200 is your ideal printing solution.

What Is The PowerBook 150 Update Extension? (4/95)

Revised: 4/14/95
Security: Everyone

What Is The PowerBook 150 Update Extension? (4/95)

Article Created: 13 April 1995

TOPIC -----

I have a PowerBook 150 which is running System 7.5. Since I installed a modem, the battery seems to get depleted very quickly. What can I do to save battery power?

DISCUSSION -----

PowerBook 150 Update Extension

When the PowerBook 150 has an internal modem, the modem continues to draw power when not in use. This shortens the battery life. Apple released the PowerBook 150 Update extension to correct this problem.

The update extends battery life by reducing power requirements during sleep mode. It also fixes a potential system freeze problem that occurs when you use the internal modem several times without restarting the computer.

System 7.5 Update 1.0

If you have installed the System 7.5 Update 1.0, you will no longer need the PowerBook 150 Update extension. The same software fix has been incorporated into the System 7.5 Update file. This file resides "loose" in the System Folder.

The System 7.5 Update file contains the functionality of and removes the following extensions: EM Sound Update, PowerBook 150 Update, and Mount IDE Drive.

Since the PowerBook 150 Update system extension is no longer needed, it is automatically removed from the Extensions folder (inside the System Folder) during installation of the System 7.5 Update 1.0.

These articles can help you locate the software update mentioned here:

- Where To Find Apple Software Updates
Lists online services for "free" Apple software updates.
- Obtaining Apple Product Support in the USA
Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library.

Changing Size Of Launcher Buttons (12/95)

Revised: 12/21/95
Security: Everyone

Changing Size Of Launcher Buttons (12/95)

=====

Article Created: 14 April 1995
Article Reviewed/Updated: 21 December 1995

TOPIC -----

How do I change the size of the buttons in the Launcher? Can I make the buttons a custom size?

DISCUSSION -----

No you cannot make your own custom sized buttons, but you can change their sizes.

The ability to change button sizes in each panel was added with Launcher version 2.5. Previous versions do not support this feature.

Changing Launcher Button Size:

Step 1

Hold down the Command key and press the mouse button while the pointer is over a section of the background pattern in the Launcher window.

Step 2

A menu will appear, with the choices of small buttons, medium buttons, or large buttons.

Step 3

Select the desired size and release the mouse button and the Command key.

NOTE: To change each panel to the same button size, you must change each panel individually. Each panel is independent of the others.

Article Change History:

..TIL17599-Changing_Size_Of_Launcher_Buttons_12-95_(TA33613).pdf

21 Dec 1995 - Added information on panel independence.

Macintosh 630 Family: 16 Bit Sound Information (4/95)

Revised: 4/14/95
Security: Everyone

Macintosh 630 Family: 16 Bit Sound Information (4/95)

Article Created: 14 April 1995

TOPIC -----

Using one of the following systems:

LC 630, Quadra 630, Performa 630, Performa 635, Performa 636, Performa 637, or the Performa 638.

The Sound Out selection in the Sound Control Panel shows 8 Bit, but the 16 Bit selection is grayed-out. How does one get 16 Bit sound out (especially when using CDs)?

DISCUSSION -----

When Macintosh 630 family computers play CD audio, the sound source is 16-bit digital audio (virtually all CD players are 16-bit). Since a Macintosh 630 family computer just passes the CD-ROM drive's audio signal to its sound output ports (adjusting only the volume), the audio is still a 16-bit digital audio signal when it comes out of these ports.

The quality of the CD audio signal that the Macintosh 630 family computer passes through its sound ports is unaffected by the choice a user makes in the "Sound Out" portion of the Sound control panel. This section of the Sound control panel affects the sounds that come from a Macintosh system's internal sound digitization circuitry.

In other words, the Macintosh 630 family is not capable of 16-bit audio by itself. The 16-bit rating referred to in the literature for Macintosh 630 family computers refers to the playback capabilities of the built-in CD-ROM drive.

Workgroup Server: Using Multiple Servers w/One Monitor (4/95)

Revised: 4/14/95
Security: Everyone

Workgroup Server: Using Multiple Servers w/One Monitor (4/95)

=====

Article Created: 12 April 1995

TOPIC -----

Are there any specific considerations I should take into account when using multiple Apple Workgroup Server computers with one monitor?

DISCUSSION -----

The major consideration to be aware of occurs when using a switch box between the computers and the monitor. The Workgroup Server uses sense line information from the monitor to determine what size monitor is connected.

When a Workgroup Server powers on, it checks to see if a monitor is attached to the video port; if no monitor is attached, it disables the video port. When a switch box is used, there is a direct connection between the monitor and only one of the computers, so the video ports on the other servers are disabled since they do not detect a monitor connected to the video port. When you switch to the other computers, no video is available.

There are several solutions but it helps to understand what is happening to understand what can be done to solve the problem.

The Workgroup Server identifies the type of monitor (scan rate and image size) through sense lines in the monitor.

When you are connecting one or more Workgroup Servers to a single monitor through a switch box, the sense line signals can be provided at three different locations; in the monitor cable coming out of the Workgroup Server, in the monitor, or in the switch box.

The best solution is to make sure that you purchase a switch box that provides sense line signals to the Workgroup Servers when the monitor is not connected. The next best solution is to obtain monitor cables for VGA monitors and run them into a switch box. The VGA cables have the sense signal information wired into them.

LaserWriter Pro 810: Problems Logging Into Virtual Printer 4/95

Revised: 4/14/95
Security: Everyone

LaserWriter Pro 810: Problems Logging Into Virtual Printer 4/95

=====

Article Created: 14 April 1995

TOPIC -----

I am having problems logging into the virtual printer server on the LaserWriter Pro 810 printer. I have checked to make sure I am using the proper cable, and I am using VT-100 emulation software set to 9600 baud, no parity and 1 stop bit. What might cause this problem?

DISCUSSION -----

Be sure that any terminal emulation software settings that add characters to keyboard input are OFF. If the virtual printer server sees any invisible characters, such as line feeds, after the user name or password, access is denied.

It is important that the terminal emulation software does not send characters other than the required username of 'su', and privileged password of 'system'; any characters are acceptable as a username, whether valid or not, but if EITHER OR BOTH fields are incorrect, access is denied after entering the password.

Sample Session

=====

```
username> su
Server> su
password> system
Server>>
```

Once the 'Server>>' prompt appears, you are logged into supervisor access.

Other Help

=====

Online help is also available to assist you. For example, 'show services' displays the current services. and 'help show services' displays all the arguments to 'show services' and what they do.

LW Pro 810: Postscript Using lp From Solaris 2.3 (4/95)

Revised: 4/14/95
Security: Everyone

LW Pro 810: Postscript Using lp From Solaris 2.3 (4/95)

=====

Article Created: 14 April 1995

TOPIC -----

How to I print to a LaserWriter Pro 810 from a Solaris 2.3 workstation?

DISCUSSION -----

Follow the steps below to print to a LaserWriter Pro 810 from a Solaris 2.3 workstation:

Step 1

Do an ftp to "ftp.support.apple.com"

Path apple SW Updates/US/UNIX/Printing software for Unix

Step 2

Get enroll utility solaris.tar.z and its readme

Decompress and then Untar the utility.

Step 3

Put enroll utility in current directory.

Step 4

Run enroll with 'enroll -b'

When running the "enroll -b" script, please choose "none" for the predefined printer model interface, not "standard".

Step 5

Use "admintool" to change the File Content from ASCII into Postscript.

Step 6

Now copy(cp) or move(mv) "/home/apple/printcap" to "/usr/apple/printcap".

Step 7

After you get the "printcap" file into "/usr/apple", please delete anything above the line "# ** |UnixExpress| entry maintained by Apple Printer Installation Program **" in "printcap", in other words, the "printcap" file should look like this:

```
# ** |UnixExpress| entry maintained by Apple Printer Installation Program *
# printer type =PRO810
# printer interface type =Ethernet
# printer physical port number =1
# UnixExpress model =standard
UnixExpress|UnixExpress|Apple remote printer on port 1:
.      :lp=UnixExpress:
.      :apple_n=128.252.171.16:
.      :mx#0:
.      :sf:
.      :sh:\
.      :pw#0:
.      :apple_text=disable:
.      :apple_pcs=:
.      :apple_scs=:
.      :apple_p=3102:
```

When you issue a "lpstat -p your_printer_queue_name -l" command, you should get the following result:

The file Content Types should be "Postscript", it should not be "simple."

Apple LocalTalk PC Card DIP Switch Settings (4/95)

Revised: 4/14/95
Security: Everyone

Apple LocalTalk PC Card DIP Switch Settings (4/95)

Article Created: 14 April 1995

TOPIC -----

What are the DIP switch settings for the original Apple LocalTalk PC Card.

DISCUSSION -----

Here are the recommended settings:

Switch number:	1	2	3	4	5	6	7	8
.	---	---	---	---	---	---	---	---
Switch position:	Off	Off	Off	Off	On	Off	On	On

Below is a detailed explanation of each switch setting.

Switch	1	2	3
.	IRQ4	IRQ3	IRQ2

Selects Interrupt Request (IRQ) priority level.

Only one of these switches can be set to the On position. The other two must be Off. Switch 1 is IRQ4, the same as serial port COM1. Switch 2 is IRQ3, the same as port COM2. Switch 3 is IRQ2, determines the priority level at which the card will interrupt the IBM computer whenever it changes state. Level 2 has the highest priority and level 4 the lowest. Do not use switch 3 if you have an IBM PC-AT computer.

Switch	4	6
.	DRQ3	DAK3

DMA Request and DMA Acknowledge on DMA channel 3.

Both of these switches must be on (and switches 5 and 7 must be off) for the card to communicate with the IBM computer via channel 3.

Switch	5	7
.	DRQ1	DACK1

DMA Request and DMA Acknowledge on DMA channel 1.

Both of these switches must be on (and both switches 4 and 6 must be off) for the card to communicate with the IBM computer via DMA channel 1.

Switch	8
.	\$24x/\$22x

Selects the address range of the card.

If this switch is on, the card will respond to control signals sent to addresses in the range \$240 to \$247. If this switch is off, the card will respond to control signals in the range \$220 to \$227. The IBM addressing scheme allows each card to respond to 32 addresses, but the LocalTalk PC Card uses only 8 of them.

Which Macintosh Computers Support DMA? (4/95)

Revised: 4/17/95
Security: Everyone

Which Macintosh Computers Support DMA? (4/95)

Article Created: 17 April 1995

TOPIC -----

Which Macintosh models support Direct Memory Addressing (DMA)? From what I can tell Power Macintosh computers support it, some Macintosh Quadras may, and the Macintosh IIfx does to a limited degree. Am I right?

DISCUSSION -----

Direct Memory Access (DMA, also called Direct Memory Addressing) is used extensively in computer systems design to help improve performance. It allows systems to transfer large amounts of data into the computer's memory, without burdening the main microprocessor.

For example, the premise behind SCSI (Small Computer System Interface) DMA is that files can be retrieved from a SCSI hard drive and loaded into memory by a SCSI DMA controller. While the DMA controller is loading files in the background, the main processor (for example: a 68030, 68040, or PowerPC processor) can continue to work on other tasks.

DMA has been used in several Macintosh products, without specifically being called out. There are several interface areas in which Apple has chosen to use DMA techniques to improve performance. These are Apple Desktop Bus (ADB), Ethernet, Floppy drive access, SCSI, serial communications, sound input, sound output, and some other I/O operations.

Standard Implementations

=====

The following is a summary of some Macintosh systems' DMA capabilities:

Apple Desktop Bus (ADB)

Apple has used ADB DMA in the following systems:

- Macintosh IIfx
- Quadra 900
- Quadra 950

Ethernet

Apple has used DMA to improve the performance of Quadra and Power Macintosh systems with built-in Ethernet ports. If a NuBus Ethernet board is used, then the system's built-in DMA capabilities are not used. The following systems use Ethernet DMA:

- Centris and Quadra systems with built-in Ethernet
- Performa 611x series
- Power Macintosh 6100, 7100, and 8100 series
- Workgroup Server 6150, 8150, 9150 series

Floppy

Some systems use DMA to improve performance when accessing files on a floppy drive. Systems which use DMA for the floppy disk drive controller include:

- Macintosh IIfx
- Centris and Quadra 660AV
- Quadra 840AV
- Quadra 900
- Quadra 950
- Performa 611x series
- Power Macintosh 6100, 7100, and 8100 series
- Workgroup Server 6150, 8150, 9150 series

SCSI

Apple has used DMA to improve SCSI performance in some systems. The following systems have SCSI DMA capability:

- Macintosh IIfx (only with A/UX 2.0 or later)
- Centris and Quadra 660AV
- Quadra 840AV
- Performa 611x series
- Power Macintosh 6100, 7100, and 8100 series
- Apple Workgroup Server 95
- Workgroup Server 6150, 8150, 9150 series

Serial

Several Macintosh systems have DMA support for serial communications. DMA is also used with GeoPort communications on appropriate systems. Systems which use DMA with the serial communications controller include:

- Macintosh IIfx
- Centris and Quadra 660AV
- Quadra 840AV
- Quadra 900
- Quadra 950
- Performa 611x series
- Power Macintosh 6100, 7100, and 8100 series
- Workgroup Server 6150, 8150, 9150 series

Sound

With the introduction of the Centris and Quadra AV systems, Apple started using DMA for sound input and output. This improves the performance and allows greater performance when recording and playing back sound. Systems which use DMA for sound input and output include:

- Centris and Quadra 660AV
- Quadra 840AV
- Performa 611x series
- Power Macintosh 6100, 7100, and 8100 series
- Workgroup Server 6150, 8150, 9150 series

Special Cases

=====

DMA is also used in the following special cases:

Macintosh SE PC Floppy Drive

The Macintosh SE PC 5.25" Floppy Disk Controller Card uses DMA to transfer PC file data from the 5.25" floppy drive directly to the memory of a Macintosh SE.

DOS Compatibility Card

The Macintosh DOS Compatibility Card uses one 32-bit DMA channel. DMA for shared memory support is provided through Macintosh system software.

Apple Monitors: How Often Do They Degauss? (4/95)

Revised: 4/17/95
Security: Everyone

Apple Monitors: How Often Do They Degauss? (4/95)

=====

Article Created: 17 April 1995

TOPIC -----

When does an Apple monitor degauss? If not every time the monitor is powered on, how do we know the degauss circuit is functional? Do any monitors have a manual degauss feature?

DISCUSSION -----

All of Apple's displays activate the degauss coil each time the monitor is powered on. The display can be degaussed by turning it off and powering back up again after waiting 15 minutes to 1/2 hour. After the waiting period, the display will degauss at power-up.

Generally speaking, in comparison to leaving a display on all the time with a screen saver, it's a good idea to power a monitor off and back on occasionally. This will activate the degauss coil to help remove any residual magnetic fields that may reduce CRT performance.

If the degauss coil has failed, magnetic fields may build up around the CRT causing purity and color shift problems in the display. The magnetic fields would be quickly noticed in the display indicating a failure and the need for service. The degauss coil and circuitry components are very reliable and failures are rare.

The older Apple High-Res RGB has a degauss button on the back of the display. Even with a degauss switch, this unit cannot activate the degauss coil any more than about once every 15 minutes to half hour.

AppleShare: Expired Password and Auto Log On (6/95)

Revised: 6/5/95
Security: Everyone

AppleShare: Expired Password and Auto Log On (6/95)

=====

Article Created: 17 April 1995

TOPIC -----

With AppleShare 4.0.2, I have my users' passwords set to expire after 90 days. I also have the users set to auto log-on at start up. When a user's password expires and their computer tries to log-on during startup, they receive no notification that their password has expired, unless they connect to the server through the Chooser. Is this normal?

DISCUSSION -----

Yes, this non-response is normal activity when a password expires and your computer is set to auto log-on to the server. This happens with AppleShare 3.0.x, 4.0.x, and 4.1. The password has expired message from the server is not seen by a user until they select the server through the Chooser.

Also a server's alias will report that it can't find the server on the network when a users password has expired. In either case you can choose the Chooser from the Apple menu, select the server, and enter your new password when prompted from the password has expired message.

PowerBook: Video Out Scan Rates (4/95)

Revised: 4/18/95
Security: Everyone

PowerBook: Video Out Scan Rates (4/95)

Article Created: 18 April 1995

TOPIC -----

What are the Horizontal and Vertical scanning frequencies for the PowerBook family computers which support video output?

DISCUSSION -----

The video output port supports 8-bit video output (512 KB of non-expandable VRAM) for 256 colors on Apple 12-inch, 13-inch, and 16-inch RGB monitors; and 4-bit video with 16 shades of gray on the Apple Portrait Display. VGA and SVGA modes are supported with appropriate adapter cables. The video controller emulates a NuBus card in slot \$E, so the video output system appears to software as a standard video card.

An adapter cable included with the computer allows users to attach a standard Apple video cable. The external video interface is enabled by attaching a monitor and restarting the computer. To connect a VGA monitor to the Macintosh video port, an adapter cable is required. Third-party cable vendors should have these cables available for purchase.

During the boot process, ROM code tests the monitor sense lines and activates the video output system if a recognized monitor is attached. If no monitor is found, the video output system is deactivated to conserve power. Because the video output circuitry consumes additional power, Apple recommends that customers use the AC adapter when using an external monitor.

- Video Scan Rates:

Monitor	Resolution			Dot clock (MHz)
	Width (pixels)	Height (pixels)	Depth (bits)	
12-inch RGB	512	384	8	15.6672
13-inch RGB	640	480	8	30.2400
VGA	640	480	8	25.1750

SVGA	800	600	8	36.000
Portrait	640	870	4	57.2832
16-inch RGB	832	624	8	57.2832

The AudioVision 14 Display is also compatible.

In normal operation the video output circuitry acts like a second monitor to extend the user's desktop. Alternatively, the user can select video mirroring mode, in which the external monitor mirrors the internal LCD. In mirror mode, software blanks the edges of the larger screen to match the horizontal and vertical pixel resolution of the smaller screen.

LaserWriter 16/600 PS: Using the Envelope Feeder W/ QDrw GX 4/95

Revised: 4/18/95
Security: Everyone

LaserWriter 16/600 PS: Using the Envelope Feeder W/ QDrw GX 4/95

=====

Article Created: 18 April 1995

TOPIC -----

I am using QuickDraw GX 1.1 and a LaserWriter 16/600 PS printer. I want to print envelopes from the envelope feeder, but I have not been able to print from the envelope feeder. Is it possible to print from this feeder?

DISCUSSION -----

Yes, you can use the envelope feeder with QuickDraw GX 1.1. Here are the steps required to setup and use the envelope feeder.

Step 1

Print something from the desktop printer. Until you use the desktop printer, you will not get the options you need to use the envelope feeder.

Step 2

Highlight the LaserWriter 16/600 GX desktop printer icon, and choose Input Trays from the Printing menu.

Step 3

Select Envelope - Edge Fed.

Step 4

Configure the internal paper trays for the paper size installed, and click OK.

Step 5

From the File menu, select Page Setup. For paper type select Envelope - edge fed, and select landscape (sideways) orientation.

Step 6

To the right of Format For, select LaserWriter 16/600 PS and click Format.

Step 7

From the File menu select Print, then click Paper Matching.

Step 8

Make sure that the option Ignore paper matching and direct all document pages to is selected.

Step 9

Select No. 10 Envelope. Do not select Envelope - Edge Fed (Envelope Feeder); If you select this, the printer uses the 250-sheet cassette.

Step 10

Select Print

Step 11

In a few seconds, a message appears explaining that the document size No. 10 Envelope is not installed. Highlight the option Change paper in internal tray to No. 10 Envelope. The words Internal Tray are dimmed. Next, select Make change permanent.

Step 11 only appears the first time you print an envelope. After you print to the envelope feeder, the message no longer appears.

What's New In Apple HD SC Setup 7.3.5? (6/95)

Revised: 6/28/95
Security: Everyone

What's New In Apple HD SC Setup 7.3.5? (6/95)

Article Created: 19 April 1995
Article Reviewed/Updated: 28 June 1995

TOPIC -----

I just downloaded Apple HD SC Setup 7.3.5 from an online service, but the Read Me document did not explain what is new?

DISCUSSION -----

Apple HD SC Setup was updated to provide support for 4 GB (gigabyte) Apple hard disk drives. Apple HD SC 7.3.5 now handles the initialization and mounting of 4 GB drives. A 4 GB hard drive is available with the Workgroup Server 8150/110 and 9150/120*. Each of those systems (and the Power Macintosh 8100/110) can accommodate volumes up to 4 GB. The HD SC Setup 7.3.5 utility and the hard disk driver that is installed when a user performs an "Update Driver" command with this utility is appropriate for use on all Macintosh computers.

Additionally, Apple HD SC Setup 7.3.5 adds a new supported feature letting users partition their Apple hard drive into additional Macintosh volumes.

By choosing Partition from the opening dialog box in Apple HD SC Setup 7.3.5, the user is given the following options for a partition:

- Maximum Macintosh
- Minimum Macintosh
- 50% Macintosh
- Standard A/UX
- A/UX System, 40MB Macintosh, Free A/UX
- A/UX System, Maximum Macintosh
- Maximum Free A/UX
- 50% Macintosh, 50% A/UX
- 10MB ProDOS, Maximum Macintosh

If the user chooses Custom from within the Partition dialog box and drags in gray area to create a new partition, the user is given the following options for

a custom partition:

- Macintosh Volume
- Scratch
- A/UX Autorecovery
- A/UX Root&Usr slice 0
- A/UX Swap slice 1
- A/UX Root slice 0
- A/UX Usr slice 2
- Free A/UX slice 3
- Free A/UX slice 4
- Free A/UX slice 5
- •Additional Mac Volume•
- Misc A/UX
- ProDOS Volume

* NOTE: Although the Server configurations with 4 GB drives mentioned above do not appear specifically on the Apple Products list, these configurations will be available to customers under Apple's Build-To-Order purchase program. For more information regarding Build-To-Order configurations, customers may call 1-800-GO APPLE.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:

28 Jun 1995 - Added information about multiple Macintosh volume support.
27 Apr 1995 - Corrected minor typo.

Newton Connection Kit: Disks Different Between Versions (4/95)

=====

Article Created: 19 April 1995

TOPIC -----

I just purchased the Newton Connection Kit for the Macintosh, and I only received one disk. My friend purchased the Newton Connection Kit several months ago and received three disks. I returned the Newton Connection Kit and got another one. It also contained only one disk. Where are the other disks?

DISCUSSION -----

The Newton Connection Kit for the Macintosh version 2.0 came with three disks. Version 2.0.2 of the Newton Connection Kit comes with only one disk. The additional disks are not needed in the new version of the Newton Connection Kit.

LaserWriter Printers: Toner and Fonts for MICR Printing (4/95)

Revised: 4/19/95
Security: Everyone

LaserWriter Printers: Toner and Fonts for MICR Printing (4/95)

=====

Article Created: 19 April 1995

TOPIC -----

I am trying to determine if any of the Apple LaserWriter printers support MICR printing.

DISCUSSION -----

MICR (magnetic ink character recognition) is commonly used in the banking industry to print information on checks that can be read quickly by both machines and humans. Although the toner used in all of Apple's black and white LaserWriter printers is magnetic, the formulation is not appropriate for MICR use. Special MICR toner cartridges for some Apple LaserWriter printers can be purchased from third-party vendors such as Printerm Datascribe, Inc.

MICR fonts which are machine readable can be ordered from most of the larger font houses such as Adobe Systems.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

World Wide Web Consultants (4/95)

Article Created: 19 April 1995

TOPIC -----

In light of all the recently released information about World Wide Web (WWW) access to the internet, I was wondering if there is a listing of any consultants out there who can help a small company or individual set up their own Web site?

DISCUSSION -----

You might try the following Universal Resource Locator (URL):

<http://macweb.batnet.com/>

MACWEB.COM contains information helpful to companys and organizations considering the Macintosh as a platform for electronic publishing on the Internet's World Wide Web.

There is a link on this page to a consultants listing:

<http://macweb.batnet.com/macwww/consultants.acgi>

This Web site lists consultants available throughout the world who are experts in electronic publishing on the Internet's World Wide Web using Apple Macintosh and compatible computers.

This article provides information about a non-Apple supported internet site. It is subject to change without notice. Apple Computer, Inc. is not responsible for its content. Please contact the site administrator for additional information.

Apple Workgroup Server 95: Autologin File (4/95)

Revised: 4/19/95
Security: Everyone

Apple Workgroup Server 95: Autologin File (4/95)

=====

Article Created: 19 April 1995

TOPIC -----

This article will answer these commonly asked Apple Workgroup Server (AWS) 95 questions:

- What is the purpose of the file named "Autologin" in the Login System folder?
- Can I set up my AWS 95 to automatically log in when powered up?
- When I turn on the power of my AWS 95, it automatically logs in as root. Why does it do that?

DISCUSSION -----

When the AWS 95 is first powered on it will immediately launch A/UX through an alias in Startup Items of the Macintosh partition. A/UX 3.x.x will usually go straight to the Finder, logging in as root if (and only if) there is no password on the root account, which is the default installation. If the administrator chooses to add a password to the root account, A/UX 3.x.x will stop at the standard A/UX Login screen and wait for a password. In the default File/Print server configuration there is a text file called "Autologin", in the Preferences Folder of the Login System Folder, which contains the name of the account for the system to automatically login to. By default it is set to root. If this file does not exist, here is how to recreate one.

- 1) Open any text editor in the Mac OS or in the CommandShell.
- 2) Create a new file and name it "Autologin"
- 3) The first line should only contain the word "root"
- 4) Save this file in /mac/sys/Login System Folder/Preferences
- 5) Quit the text editor.

With this file present, the next time the server starts up, it will automatically log in and (if the proper alias is in the default System Folder) launch AppleShare File or Print services. For security reasons, many

administrators may NOT want the file server to automatically log in as root. To prevent this from happening, remove this file from the /mac/sys/Login System Folder/Preferences folder.

NOTE: This file is not usually present in default database configurations.

AppleShare 3.0.1 and System Error -35 (4/95)

=====

Article Created: 19 April 1995

TOPIC -----

We are using AppleShare 3.0.1 with System 7.0.1 on a Macintosh SE/30 with an 80 MB hard drive. When attempting to view access privileges in AppleShare Admin, I get the following message:

"The Access privileges on this volume have been lost. AppleShare will attempt to recreate them. System error -35."

We tried deleting the AppleShare PDS file but continue to get the same error.

DISCUSSION -----

The Error -35, "no such volume" may come from problems in the volume information block, and could indicate other problems with the directory structure of the hard drive.

Use a disk utility, like Disk First Aid or a third-party utility, to correct the problem. If that fails, reformat the drive.

WARNING: Be sure to backup your data before reformatting the drive. The format process will erase all data from your hard disk.

Multiple Scan Display: High Pitched Whine at Highest Res. (4/95)

Revised: 4/20/95
Security: Everyone

Multiple Scan Display: High Pitched Whine at Highest Res. (4/95)

=====

Article Created: 20 April 1995

TOPIC -----

I've noticed a high pitched whine emanating from my Multiple Scan 17 display. It seems to get worse when I change to the highest resolution. What can be done to resolve this issue?

DISCUSSION -----

If the screen on the display is operating normally while the noise is occurring, then the problem is most likely related to a sub-harmonic of the horizontal sweep frequency--that is why the noise occurs only in one resolution.

This suggests that the flyback transformer is probably the culprit. Replacement of the main board is the best way to resolve this issue; there are no adjustments to reduce or remove the noise.

Using a Modem With a Cellular Phone (4/95)

Revised: 4/21/95
Security: Everyone

Using a Modem With a Cellular Phone (4/95)

=====

Article Created: 21 April 1995

TOPIC -----

What difficulties can I expect when using a modem with a cellular phone?

DISCUSSION -----

Running a data link over a cellular connection can be pretty tricky. Many current modems do not have MNP-10 capability. MNP-10 is an enhanced error correction protocol developed to allow reliable data communications over data link connections that are inherently noisy, such as cellular. Specifically, MNP-10 was developed for use over cellular data links.

Air Communications and ORA Electronics have both developed methods of improving the reliability of cellular data links.

To locate a vendor's address and phone number, use the vendor's name as a search string in the Tech Info Library.

Duo Docks: Multiple Scan Resolution Switching (1/96)

Revised: 1/8/96
Security: Everyone

Duo Docks: Multiple Scan Resolution Switching (1/96)

Article Created: 21 April 1995
Article Reviewed/Updated: 8 January 1996

TOPIC -----

I have a PowerBook Duo 280c with a Duo Dock with 1Mb of VRAM and PowerBook Duo enabler 2.0. I have the Dock connected to a Multiple Scan 17 Display. However, I cannot use any resolutions other than 640x480.

DISCUSSION -----

The release of System Software (7.1.1 or 7.5) makes a significant difference when a Duo is inserted into an original Duo Dock. In comparison, the Duo Dock II offers multiple resolutions, when either version of System Software (7.1.1 and PB Duo Enabler 2.0, or 7.5) is installed.

In an original Duo Dock with System Software 7.1.1, the additional VRAM offers additional colors, but not additional resolutions. In order to access additional resolutions on the Multiple Scan 17 Display, you either need a display adapter (because the Dock does not recognize the sense pins on the monitor cable), or you need the newer version of System Software, version 7.5.

I tested with one such adapter and while it allows for a higher resolution, it does not allow for switching of resolutions "on the fly". Whatever resolution you select on the adapter, is the only resolution available.

Display adapters do not increase the number of resolutions a Duo Dock can handle, but they do give you access to all the resolutions that the Duo Dock can support. The highest resolution supported on the original Duo Dock is the 16-in. monitor resolution of 832 x 624.

Duo Dock with 1MB VRAM
=====

System	Display Adapter	Resolutions Supported
--------	-----------------	-----------------------

-----	-----	-----
7.1.1	NO	640x480

TrueType Fonts: No resolution limitations (4/95)

Revised: 4/24/95
Security: Everyone

TrueType Fonts: No resolution limitations (4/95)

=====

Article Created: 24 April 1995

TOPIC -----

Is it true that TrueType fonts have a limit of 600 dots per inch (DPI) ? How does this relate to PostScript fonts? Are the technologies similar?

DISCUSSION -----

There is no maximum resolution, nor any specific scaling rules, that apply for TrueType fonts. TrueType fonts are based on a relative, fundamental coordinate system (called an em square), with mathematical equations to "grid-fit" the characters in that coordinate system. To scale and/or print the font, a transformation is made from relative to absolute values based on the output device's resolution in pixels.

Likewise, PostScript fonts do not have a DPI limitation. They are also based on coordinate systems and mathematical equations (like TrueType) to translate between relative and absolute values, in order to "map" to the resolution of the output device.

In terms of comparing the technologies, PostScript is a full-fledged page description language, whereas TrueType only deals with font technology - fonts are only a subset of more major technologies. It would be more appropriate to compare PostScript to QuickDraw GX as they are both the major technologies.

Apple MessagePad: Changing the Default Font (4/95)

Revised: 4/24/95
Security: Everyone

Apple MessagePad: Changing the Default Font (4/95)

=====

Article Created: 24 April 1995

TOPIC -----

I am using an Apple MessagePad 120 and want to change the font from plain 12 to fancy 12. I already made the change in the Styles box, but the new text still appears plain. If I select the text to change, and then change the style, it works. How can I change the style without having to specify the change each time?

DISCUSSION -----

The default font for Notes is set in the Styles area of the Extras drawer when a new Note is created. If your default font style was Simple 12 point plain when you created the Note, you can select the type and change it using Styles, but it will not be the default font for that Note. If you set Styles to Fancy 18 point Bold, then create a new Note, the default font will be Fancy 18 point Bold.

The Names, Dates and ToDo font are preset to specific defaults. The default font in these areas cannot be changed.

AudioVision: System 7.5 Requires AppleVision SW v1.0.1 (1/96)

Revised: 1/25/96
Security: Everyone

AudioVision: System 7.5 Requires AppleVision SW v1.0.1 (1/96)

=====

Article Created: 24 April 1995
Article Reviewed/Updated: 25 January 1996

TOPIC -----

I just upgraded from System 7.1 to System 7.5, and noticed that my Sound control panel no longer shows the AudioVision option. I have reinstalled the AudioVision software using the Installer disk that originally came with my AudioVision 14 Display, but it did not solve this problem. How can I get the AudioVision option back?

DISCUSSION -----

Neither System 7.5 or System 7.5 Update 1.0 come with the required ~AudioVision extension you need. The supported display software for your monitor on a System 7.5.x computer is AppleVision Display Software 1.0.1. This software is available from online services.

These articles can help you locate software updates mentioned here:

Native Microsoft Applications: Issue w/QuickDraw GX (6/96)

Revised: 6/5/96
Security: Everyone

Native Microsoft Applications: Issue w/QuickDraw GX (6/96)

=====

Article Created: 26 April 1995
Article Reviewed/Updated: 5 June 1996

TOPIC -----

This article documents an issue with native applications from Microsoft, the solution, and a temporary workaround.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for Microsoft's address and phone number.

DISCUSSION -----

After an extensive debugging effort put forth by Apple and Microsoft, we have located the cause of the crashes or freezes that many of you see in the native Microsoft Word 6, Word 6.0.1, and Excel 5 when QuickDraw GX is installed on PowerPC computers. These crashes can generate several error messages including "Type 11" and "No FPU Installed".

The problem is believed to be caused by a bug in a piece of PowerPC code used by Microsoft in their native versions of both Microsoft Word and Excel use. The bug is NOT in QuickDraw GX, System 7.5, System 7.5 Update 1.0, or System 7.5 Update 2.0.

The nature of the bug makes it somewhat random whether or not your computer will crash, but the solution or temporary workaround guidelines are listed below. Apple and Microsoft engineers are discussing this problem, and Microsoft's Customer Support staff should have more information in a few days. This problem has been resolved by Microsoft.

Solution
=====

Microsoft has made available a file called MC1164 which can be obtained from their Customer Support or online services.

Workaround

=====

Tips

If you are running the native versions of the Microsoft products along with QuickDraw GX, then you may experience crashes during printing. In fact, this problem could result in crashes even when QuickDraw GX is not installed, although we are not currently aware of any such reports. To fully avoid the problem (especially if you are using QuickDraw GX), run the non-native versions of these Microsoft products.

If you feel the need to use the native versions of these products, along with QuickDraw GX, and you are using a US system, then you can reduce your risk of crashes by doing the following. (Note that non-technical Macintosh users should ask one of their technical friends to help them out.)

Step 1

Copy (option drag) the Fonts folder from your System Folder to your desktop.

Step 2

Make another folder on your desktop called "Disabled fonts".

Step 3

Using ResEdit, open each file in the Fonts folder that's on your desktop. If any file doesn't contain 'sfnt' resources, close the file and move it to the "Disabled fonts" folder using the Finder.

Step 4

Drag the Fonts folder from your system folder to the trash.

Step 5

Drag the Fonts folder that's on your desktop to your system folder.

Step 6

Reboot.

NOTE: If after step 5 you do not have the Chicago, Geneva, and Monaco fonts in your system folder's Fonts folder, then reinstall your fonts using the system 7.5 installer.

If you are running the native versions of these applications, the fonts in the "Disabled fonts" folder must be temporarily removed in order to avoid this bug.

If you cannot bear to part with these fonts, reconsider installing the emulated versions of the applications. Be sure to hold onto the disabled fonts for when a fix is available. There is nothing wrong with these fonts, but having them installed causes a high risk code path to be taken. Without these fonts installed, your risks of crashing drop significantly.

Microsoft customer support should be able to answer your questions about this issue or explain how to get their latest MC1164 software update.

Multimedia Tuner Extension: Red Check Mark Through Icon (1/96)

Revised: 1/19/96
Security: Everyone

Multimedia Tuner Extension: Red Check Mark Through Icon (1/96)

=====

Article Created: 26 April 1995
Article Reviewed/Updated: 19 January 1996

TOPIC -----

When I start up my Macintosh PowerBook 540c and my extensions appear across the bottom of the display, there is an extension with a red check mark over the icon.

I know that a red "X" over an icon means that the extension did not load for some reason. What does a red check mark mean?

DISCUSSION -----

The Apple Multimedia Tuner 2.0.1 extension starts up with a red check mark over the icon. This is the normal appearance of Multimedia Tuner icon.

The Multimedia Tuner addressed some performance issues which occurred with some multimedia applications when used with versions of QuickTime previous to 2.1. You should update to QuickTime 2.1, available online, which includes the fixes in the Multimedia Tuner.

These articles can help you locate the QuickTime 2.1 software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:
19 Jan 1996 - Added QuickTime 2.1 information.

PwrBook: Seeing Battery Level After System Update Install (4/95)

=====

Article Created: 26 April 1995

TOPIC -----

After installing System 7.5 Update 1.0 on my PowerBook, the battery indicator in the menu bar disappeared. How do I get the battery indicator back?

DISCUSSION -----

The battery indicator, located in the menu bar to the left of the Balloon Help menu, is an option with System 7.5. Open the "Date & Time" control panel and select "Clock Options...". Check the "Show battery level" to regain the battery level indicator.

QuickTake 150: Windows Troubleshooting (4/95)

Revised: 5/24/95
Security: Everyone

QuickTake 150: Windows Troubleshooting (4/95)

Article Created: 26 April 1995

TOPIC -----

This article provides help with problems you might encounter connecting the QuickTake 150 to an IBM-compatible computer running Microsoft Windows.

DISCUSSION -----

PROBLEM: The computer doesn't recognize the camera.

SOLUTION: Different devices and programs may compete with the camera for the use of a serial port on your computer. If there's a problem, a message tells you that the camera is not responding.

- Make sure the serial cable is connected properly, the camera is turned on, and the batteries have enough power.

- If you connect the QuickTake camera to COM3 or COM4 and experience communication problems, you need to check the Windows Ports control panel settings. (The Control Panel group is located in the Main window.)

To Check Windows Ports control panel settings:

Step 1

Open the Windows Ports control panel.

Step 2

Select COM3 or COM 4

Step 3

Click the Settings button

Step 4

In the dialog box that appears, click the Advanced button.

Step 5

In the Advanced Settings dialog box, make sure the settings are:

. - COM1 3F8 IRQ4
. - COM2 2F8 IRQ3
. - COM3 3E8 IRQ4
. - COM4 2E8 IRQ3

Step 6

Click OK

If you changed the settings, you must restart Windows for the new settings to take effect. When you click OK, a message lets you choose to restart now or delay the restart.

If you are using several serial devices with your computer, make sure that the line IRQSharing=ON exists in the [386enh] section of the SYSTEM.INI file.

PROBLEM: Your computer reboots when you try to communicate with the camera.

SOLUTION: The Windows software on some computers cannot receive data at the speed the camera sends it and can cause a reboot. To remedy the problem, you must change the speed.

To change the speed:

Step 1

On your computer, double-click the QuickTake Serial Ports icon to run the application.

Step 2

In the dialog box that appears, change the baud rate to 9600.

Step 3

With the camera connected to your computer and turned on, click Test.

If your computer communicates successfully with the camera at 9600 baud, a message tells you so. If your computer cannot communicate with the camera at 9600 baud, there is one way to fix the problem: Install a low-cost, high-speed serial card equipped with a buffered 16550 UART. (High-speed serial cards with this feature clearly advertise it on the box).

Step 4

Repeat steps 2 and 3, gradually raising the baud rate and testing the result.

For example, change the baud rate from 9600 to 19,200.

Step 5

If a test causes the computer to reboot, run the QuickTake Serial Ports application again and change the baud rate back to the next lower number. For example, if the computer reboots when the baud rate is 38,400, change it back to 19,200.

At slower baud rates, it takes longer to transfer images from the camera to your computer. If this is a problem, see the next item.

PROBLEM: It takes too long to transfer images from the camera to your computer.

SOLUTION: If you think it takes too long to transfer images from your camera to your computer, you can upgrade your hardware to avoid the problem. Install a low-cost, high-speed serial card equipped with a buffered 16550 UART. (Most high-speed serial cards come with this feature clearly advertised on the box.)

QuickTime for Windows 2.0.2: Changes from version 2.0.1 (4/95)

Revised: 5/24/95
Security: Everyone

QuickTime for Windows 2.0.2: Changes from version 2.0.1 (4/95)

=====

Article Created: 26 April 1995

TOPIC -----

This article provides a list of changes in QuickTime for Windows 2.0.2 from version 2.0.1. A separate article covers changes made between versions 2.0 and 2.0.1.

DISCUSSION -----

Changes

=====

1. Updated enum {hintsScrubMode} to be consistent with Inside Macintosh (does not affect any known applications).
2. Added enum {hintsLoop} to public interfaces.
3. Added new selector to VHDW components to hint the bounds rect for image drawing.
4. Movie controller component update to differentiate between UI and program requests.
5. Movie controller does not preroll from start when looping.
6. Movie controller uses enum {hintslloop} while looping.
7. MCI controller now uses "NULL_BRUSH" instead of "WHITE_BRUSH" to paint background prior to video display. This avoid white flash during preroll of movie.
8. Viewer can be installed multiple times in the same windows session.
9. Added more BMP types to QTCodec.h.

10. Modified PICT decompression to behave more closely to Macintosh toolbox when malformed PICTs are decompressed.

11. Eliminated sound popping of IMA audio on Forte-16 sound cards.

12. Added QTW.INI setting "[sound] channelcontrol={8 or 16} that allows user to force 8-bit audio even when they have a 16-bit audio card. This allows users to avoid hardware DMA conflicts without reconfiguring their hardware.

13. Improved performance of IMA audio compression.

14. Allow same application to use QTW APIs and MCI/QT APIs simultaneously.

15. Changed AlignWindow to move down/right instead of up/left.

16. Initialize EDI instead of DI in WHDW components.

AppleShare Workstation 3.5 and 3.6 Changes (4/95)

Revised: 4/26/95
Security: Everyone

AppleShare Workstation 3.5 and 3.6 Changes (4/95)

Article Created: 26 April 1995

TOPIC -----

What are the changes for AppleShare Workstation client 3.5 and 3.6 software with the release of AppleShare 4.1 and Workgroup Servers 6150/66, 8150/110, and 9150/120?

DISCUSSION -----

AppleShare 3.5 Changes

- The allocation block size calculation was changed so server volumes larger than 2 GB will get the correct allocation block size.
- A GetVolParms call was changed to return the correct information.
- The .AFPTranslator driver was changed to a "ROM based" driver (the DCE's RAM-based bit is cleared and the dCtlDriver field changed to a pointer). This change was made to prevent the Device Manager from calling _HLock and _Unlock on the driver during calls to it, which could potentially be done at interrupt time.
- An 'afps' gestalt selector is now defined by the workstation that gives information about the characteristics of the workstation and the current version, independent of the 'vers' version. This was because the 'vers' version could be confusing with changes in the workstation software.
- A new Status call that returns session information when doing your own AFP calls on an existing AppleShare session.
- Some changes to some underlining code, the checkbox drawing code, and the password bullet code to handle 2-byte scripts better and to make it easier to localize, especially for KanjiTalk.

Major changes from AppleShare 3.5 client to AppleShare 3.6 client

- The workstation defines two new gestalt selectors that make the 7.5.1 Finder use larger I/O during copies to or from a remote volume. The 7.5.1 Finder checks the 'afps' selector to see if the workstation version is correct, then gets the value of the 'fndß' and 'fnd†' selectors. If copying to or from a remote volume with a volume grade is less than the value in 'fnd†', it will use a buffer size specified by the 'fndß' selector. This makes Finder Copy performance faster.
- The workstation also now implements a read ahead/write behind cache for sync read/write calls done by the Finder. This also helps increase Finder copy performance.
- The workstation has a small desktop database cache (that is GetAPPL calls and GetIconInfo calls) to help cut down on extraneous network traffic on many Finder operations.

In general, there are some changes made that work only if the Finder is requesting the I/O and that are geared toward improving Finder performance. The 7.5.1 Finder was also changed to take advantage of some of these changes.

Power Macintosh 7100: Audio Connector Pinouts (4/95)

=====

Article Created: 27 April 1995

TOPIC -----

I need to build a cable to make a non-Apple CD ROM audio work on the Power Macintosh 7100. I cannot find the pinouts for the audio connector on the logic board anywhere.

DISCUSSION -----

The pinouts for the CD-ROM Audio Connection on the Power Macintosh 7100 is:

Pin	Signal
1	CD in Left
2	CD Common
3	CD Common
4	CD in Right

The connector is J19 on the logic board. This connector is located behind the drive bays.

Apple Telecom 2.0 and Express Modem (4/95)

Revised: 4/27/95
Security: Everyone

Apple Telecom 2.0 and Express Modem (4/95)

=====

Article Created: 27 April 1995

TOPIC -----

I've seen that Apple Telecom 2.0 has been released. From looking at the Read Me, I cannot tell for sure what I'm gaining if I have an Express Modem. Can you please describe the features from a PowerBook standpoint, for example, does MegaPhone work with the Express Modem?

DISCUSSION -----

No, MegaPhone does not work with the Express Modem. You do get QuickDraw GX support, and the network shared Fax feature. We recommend the use of the latest software available, so updating to Apple Telecom 2.0 is advisable.

Also QuickDraw GX support requires QuickDraw GX 1.1 or later. This does not come with System 7.5 Update 1.0 or with the Apple Telecom 2.0 software. These articles can help you locate the QuickDraw GX software mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.

Print Server: Net Traffic After Turn Off Capture Printer (4/95)

Revised: 4/27/95
Security: Everyone

Print Server: Net Traffic After Turn Off Capture Printer (4/95)

=====

Article Created: 27 April 1995

TOPIC -----

I have noticed that the network traffic light becomes very active after turning off a printer captured by an AppleShare Print Server. Can you provide any information as to why this happens.

DISCUSSION -----

If a printer is turned off after being captured by an AppleShare Print Server, the server will start sending out AARP (AppleTalk Address Resolution Protocol) packets at a rate of 10 every second. This causes some extra traffic on the network, but by most network standards this extra traffic is not considered excessive.

If this traffic becomes a concern, here are three options to workaroud it:

- Select the printer in the Printer Server, release the printer before powering it off, then re-capture the printer on the Print Server after powering it back on.
- After powering the printer on, send a print job to the spooler. This will reconnect the printer and change the device type back to LaserShare, which will stop the AARP packet broadcasts.
- The problem will only arise if the printer is powered off. The third option is to not power off the printer.

AWS95 & A/UX: tar To Transfer Files On Different Systems (4/95)

Revised: 4/27/95
Security: Everyone

AWS95 & A/UX: tar To Transfer Files On Different Systems (4/95)

=====

Article Created: 27 April 1995

TOPIC -----

This article describes how to backup a UNIX file system, which is not an Apple Workgroup Server (AWS) 95, with a DAT tape drive, and restore that data onto an AWS 95.

DISCUSSION -----

Transfer Files

The tc driver under A/UX is limited to reading 8K blocks, so in order for tapes created on other UNIX systems to be read under A/UX the tapes must be created with this block factor. For example, if tapes created on a Hewlett Packard (HP) workstation do not specify an 8K block factor, an AWS 95 will not be able to read these tapes.

In the past, we have successfully create tapes on other UNIX systems using the following command:

```
tar -cvf - . | dd of=/dev/rmt/tc2 obs=8kx40      (to create the archive)
```

Used the following command on the AWS 95 to read the tapes:

```
dd if=/dev/rmt/tc2 ibs=8kx40 | tar -xvf -      (to read the archive)
```

AWS 95 & A/UX: tc Driver and Specify the Tape Size (4/95)

Revised: 4/27/95
Security: Everyone

AWS 95 & A/UX: tc Driver and Specify the Tape Size (4/95)

=====

Article Created: 27 April 1995

TOPIC -----

This article describes how the tc driver works with regard to block sizes and how to specify the exact size of the tape to tc from the command line.

DISCUSSION -----

The following command will create a tape on an Apple Workgroup Server (AWS) 95:

```
tar cvlbBf 16 4500 /dev/rmt/tc2 /MI48585
```

However, this command tells the driver the tape capacity is 2MB not 2GB. This is because the 'B' option argument is the number of 512 byte blocks in the active media. The DAT drive has about 2GB in capacity which is calculated as follows:

$2 * 1024 * 1024 * 1024 = 2147483648$ bytes.

Therefore the number of 512 byte blocks would be 4194304 and the command should be:

```
tar cvlbBf 16 4194304 /dev/rmt/tc2 /MI48585
```

The capacity of the DAT drive returned by the command,
`mt -f /dev/rmt/tc2 status`, is 1992271053 bytes which is 3891154 blocks, so the
tar command should be:

```
tar cvlbBf 16 3891154 /dev/rmt/tc2 /MI48585
```

MAE 2.0: Loud Startup Sound (4/95)

Revised: 4/27/95
Security: Everyone

MAE 2.0: Loud Startup Sound (4/95)

Article Created: 27 April 1995

TOPIC -----

When MAE starts up under Solaris 2.4, SPARCstation 5, it about blasts me out of my chair with the sound volume. Is there a way to set the startup sound volume?

DISCUSSION -----

In the Sound control panel, there are various sub-panels. Clicking on the Alert Sounds pop-up menu will bring up the choices Alert Sounds, Sound In, Sound Out, and Volumes. The volume control in the Alert Sounds sub-panel controls the volume of alert sounds (error beeps). In the Volumes sub-panel is the system volume control. It defaults to 50% volume which, even so, can be quite loud. If you lower that volume, all sounds will be scaled down in volume, including the startup sound.

Unsupported feature

If you do not want the startup sound at all, but you do want other Macintosh sounds, you can set an environment variable TB_NOSTARTUPSOUND to 1 and no startup sound will occur.

Otherwise, if you want no sound at all, you can set TB_SOUND_OFF to 1 (or add command line option -nosound) and MAE will be silent with the exception of using the standard XBell() for Alert sounds.

HyperCard 2.3: Description and Specifications (4/95)

Revised: 4/28/95
Security: Everyone

HyperCard 2.3: Description and Specifications (4/95)

=====

Article Created: 28 April 1995

TOPIC -----

The following article gives a brief overview of and lists technical specifications for HyperCard 2.3.

DISCUSSION -----

Description

=====

HyperCard 2.3, is the latest version in Apple's tool for creating custom software solutions for business, education, and multimedia. The software is intended for commercial developers, consultants, in-house programmers, and end users to display information in any way they need to.

HyperCard organizes information into easy-to-use "stacks" of cards through which users can navigate and search for the information they need. Simply by clicking on a button, they can view related text, see a graphic, hear a sound, watch a QuickTime movie, or listen to text spoken out loud.

HyperCard provides an easy mechanism for distributing the stacks you have created. You can save any stack as a stand-alone, double-clickable Macintosh application that can be distributed without software royalty fees.

Technical Specifications

=====

Usage Requirements

- Macintosh, Power Macintosh, or PowerBook computer
 - QuickTime tools require 68020 processor or greater
 - Text-to-speech requires 68040 processor or grater
- Hard Drive

- 2MB RAM minimum with systems previous to System 7
- 4MB RAM minimum with System 7
- 5MB RAM recommended when using color tools
- System 6.0.5 or later
 - 6.0.7 required for color tools
 - 7.1 or later required for AppleScript, Button Tasks, Stand-alone application builder.
- QuickTime Tools require QuickTime system extension
- Text-to-Speech requires PlainTalk software (included)
- Multilingual HyperCard Applications may require WorldScript software and/or international versions of AppleScript software.

Support For Scripting Languages

- Add power and versatility to HyperCard applications using HyperTalk (HyperCard's scripting language) or any scripting language compatible with the Open Scripting Architecture (OSA), such as AppleScript.
- Attach AppleScript scripts to HyperCard objects such as buttons to launch and control other applications, exchange data with them, and so on—even over a network.
- Link HyperCard stacks with any of more than 100 scriptable applications, such as Claris FileMaker Pro 2.0 and Microsoft Excel 4.0 (applications must be running under System 7).
- Use localized versions of AppleScript system extensions to script in Japanese, French, or other languages (requires additional software).

Multimedia Features

- Add QuickTime movies to stacks using the QuickTime Tools stack
- Include sound, animation, and graphics in your stacks
- Have HyperCard text read aloud by your computer

Color Drawing And Painting Tools

- Choose from 256 colors to apply to buttons, fields, backgrounds, and cards
- Import 24-bit color or grayscale PICT graphics
- Resize, reposition, and edit graphics on the card
- Create PICT images with 24-bit color painting tools

Automated Button Tasks

- Automatically assign tasks to buttons without writing a single script
- Go to another destination (first card, previous card, home, or others)

- Play a QuickTime movie
- Play a sound
- Have text read aloud (using PlainTalk software)
- Launch another application
- Apply visual effects for transitions between cards

Development Features

=====

- Third-party external commands (XCMDs) let you control a wide variety of systems and equipment, including mainframe computers, networks, videodisc players, and CD-ROM drives.
- Hypertext applications can be created by linking a word or group of words.
- Modeless script editor lets you view several scripts and stacks at once and quickly copy and paste HyperTalk or AppleScript code between them.
- Debugging menu lets you set checkpoints in, and step and trace through, a HyperTalk script while it's running, for fast and easy troubleshooting.
- Background processing lets you continue working in other applications while complex scripts are running or while you compact or sort a stack.
- Variable Watcher shows how variables are used and changed and lets you edit variables while debugging your script.
- Message Watcher lets you view HyperTalk messages as they're sent, so you can see how your program's logic really works.
- "Save as" options let you create stand-alone applications or ones that can run using HyperCard Player (widely available on Macintosh systems).

Flexible Formatting And Reporting

- Design multiple report layouts for each stack—and copy and paste report formats between stacks.
- Control the content, appearance (including font, size, and style), and placement of text elements in report formats
- Create card sizes ranging from 1 by 1 inch to 18 by 18 inches.
- Print individual fields, selected parts of a card, a single card, selected cards (containing a certain word, button, or background), or an entire stack

Support

=====

..TIL17668-HyperCard_2-3-Description_and_Specifications_4-95_(TA33663).pdf

HyperCard 2.3 is supported by the Apple Assurance Software Support group at 1-800-SOS-APPL (767-2775).

HyperCard 2.3: Read Me (4/95)

Revised: 4/28/95
Security: Everyone

HyperCard 2.3: Read Me (4/95)

=====

Article Created: 28 April 1995

TOPIC -----

The following article is the ReadMe document for HyperCard 2.3.

DISCUSSION -----

Please read this entire "Read Me" file. It contains important information and tips that will enhance your experience with HyperCard 2.3. We recommend that you print a copy.

Installing HyperCard
=====

To install HyperCard 2.3 on your hard drive, insert the disk called "HyperCard Installer," double-click the file called "Installer" and then follow the instructions on your screen.

The "Easy Install" option of the HyperCard Installer installs the version of HyperCard 2.3 that's optimized for your Macintosh computer.

If you have a Macintosh computer with a PowerPC upgrade card and the card is enabled, the "Easy Install" option will install the version of HyperCard that's optimized for any Macintosh. If the PowerPC upgrade card is disabled, the Installer will install the version of HyperCard that's optimized for a Macintosh computer with a 680x0 microprocessor.

You can choose which version of HyperCard to install by using the "Custom Install" option of the HyperCard Installer. This option gives you three choices:

- 1) HyperCard optimized for Macintosh computers with PowerPC microprocessors
- 2) HyperCard optimized for Macintosh computers with 680x0 microprocessors.

3) HyperCard optimized for any Macintosh. If you install one of these versions and then change your mind, delete the version that you installed and run the Installer again.

System And Memory Requirements

=====

Hardware Requirements

- An Apple Macintosh, Power Macintosh, or PowerBook computer; QuickTime Tools require a 68020 or later microprocessor; text-to-speech function requires a 68040 or later microprocessor.
- A hard disk drive.
- At least 2MB of RAM; 4MB of RAM required for system software version 7.0 or later; 5MB of RAM recommended when using Color Tools; 8MB of RAM required for Macintosh Computers with PowerPC microprocessors.
- HyperCard's memory partition should be set to at least 2200K to use the Color Tools (5120K on Macintosh Computers with PowerPC microprocessors with virtual memory off). HyperCard's memory partition should be set to 3072K, or more, to use the Color Painting Tools (5120K on Macintosh Computers with PowerPC microprocessors with virtual memory off).

Software Requirements

HyperCard 2.3 requires system software version 6.0.5 or later. System software 7.0 or later is required for AppleScript and the Color Paint Tools. The HyperCard Button Tasks and the standalone application builder require system software 7.0 together with either the AppleScript or the QuickTime system extension. The Button Tasks will also work with system software 7.1 or later with or without the QuickTime or AppleScript system extensions. On Macintosh computers with PowerPC, the HyperCard Button Tasks and the standalone application builder require the AppleScript system extension, the AppleScriptLib file and the ObjectSupportLib file. These items will automatically be installed in your system extensions folder when you choose easy install or when you choose custom install and install AppleScript.

QuickTime Tools requires the QuickTime system extension.

Text-to-speech requires the Speech Manager system extension (included) or the PlainTalk software package.

Multilingual HyperCard applications may require WorldScript software and/or international versions of AppleScript software.

WorldScript software requires system software 7.1 or later.

Button Task Requirements

On Macintosh computers with PowerPC microprocessors, the Button Tasks require

the AppleScript system extension, the AppleScriptLib file and the ObjectSupportLib file. These items will automatically be installed in your system extensions folder when you choose easy install or when you choose custom install and install AppleScript.

On Macintosh computers with 680x0 microprocessors, the Button Tasks require system software 7.0 together with either the AppleScript or the QuickTime system extension. The Button Tasks will also work on Macintosh computers with 680x0 microprocessors running system software 7.1 or later with or without the QuickTime or AppleScript system extensions.

The Movie Button Task requires the QuickTime system extension. The task will not appear if the QuickTime system extension is not present.

The Speech Button Task requires the Speech Manager system extension (included) or the PlainTalk software package. The task will not appear if the Speech Manager system extension or the PlainTalk software package is not present.

The Sound Task requires sound input hardware in order to record.

Notes On Using HyperCard 2.3 For The First Time After Installation

=====

The first time you use HyperCard 2.3, it is possible that double-clicking a stack that you already have on your machine will fail to launch HyperCard, or will launch an earlier version of HyperCard. If this happens to you, simply open the HyperCard 2.3 folder. Once you have done this, double-clicking a stack will launch HyperCard 2.3.

It is also possible that you will not see stack icons on the stacks on your system after you install HyperCard 2.3 for the first time. If this happens to you, simply open the HyperCard 2.3 program folder and restart your Macintosh computer. After you have restarted, the stack icons will appear correctly.

New HyperCard Features

=====

HyperCard 2.3 contains some new and exciting features. For this release of HyperCard we have added:

- Support for Macintoshes with PowerPC microprocessors. This includes the ability to generate standalone applications which are optimized for Macintoshes with PowerPC microprocessors.
- New Button Tasks which allow you to generate HyperTalk scripts without scripting.

We have included tasks for:

- playing movies
- playing and recording sounds
- moving from card to card

- using text-to-speech
- adding visual effects
- opening applications

We expect third-party developers to develop additional button tasks.

- Text-to-Speech capabilities. (only for Macintoshes with 68040 or better microprocessors)
- Enhancements to the Color Tools including a new color painting environment.

Notes On HyperCard

=====

Users with 9-inch screens may have problems viewing the task window associated with the new Button Tasks. When editing a stack with standard size cards, if you open the task window by choosing the "Tasks..." button in the Button Info dialog, and then bring another window forward, the tasks window will go behind the card window. It will look as though the task window has disappeared even though it is still present. Select "Next Window" to bring the task window forward.

The tilde key "~" no longer takes you back in HyperCard. Command-tilde will still take you back.

HyperCard 2.3 includes the necessary system extension for performing text-to-speech. The Installer will only install this software on Macintoshes with 68040 or better microprocessors. Text-to-speech is restricted to Macintoshes with 68040 or better microprocessors.

In low memory situations, stacks with card sizes larger than 512 by 342 pixels will not open to their full size. Additionally, you will not be able to use HyperCard's Color Paint Tools or the Color Tools, and you will not be able to print cards.

External commands may cause HyperCard to think that it is in a low memory state. If you are using system 7.5 and your stacks are not opening to full size after increasing HyperCard's memory partition, try disabling the Macintosh Easy Open extension.

Notes On Color Tools

=====

The Color Paint Tools require system software 7.0 or greater.

The Color Paint Tools can require large amounts of memory depending on the size and bit depth of the pictures that you are editing or creating. We recommend against using the Color Paint Tools on a Macintosh computer with less than 5MB of RAM or when HyperCard has a partition smaller than 3072K. Many of the Color Paint operations will not work properly in low memory. If you are seeing frequent messages about low memory while using the Color Paint Tools, exit

HyperCard and increase its memory allocation. We recommend increases of at least 300K. Continue increasing the allocation until you no longer see the out of memory messages or until you have exceeded the available memory on your machine. For instructions on how to increase HyperCard's memory allocation, see "Preparing a Color Standalone Application" in Chapter 3 of the "Getting Started" guide.

The Color Tools Demo in the Color Tools Stack does not work when the stack has been locked with the Finder.

The Color Tools stack requires a monitor with at least 256 colors or shades of gray.

We recommend against coloring your Home stack. If not scripted correctly, a colored Home stack will cause HyperCard to run slower than it would with a non-colored Home stack.

When using the Color Paint Tools, operations that cause the picture to extend beyond the bounds of the window may cause parts of the image to be lost. This happens when rotating and scaling. You can prevent this problem by expanding the size of the window before performing the operation. Note that expanding the window will increase the memory needed to display the picture.

After editing a picture that has been placed on a card, the picture may be displayed in a different scale. If you want the picture to be displayed at a 1-1 scale, double-click the picture and select "Original Size."

With the "Rotate by degree" feature of the Color Paint Tools, rotations are measured from the orientation of a graphic at the time it was selected. If you rotate a selection and then rotate it again, the rotations do not accumulate. If you want cumulative rotations, deselect the graphic after rotating it the first time, re-select it and rotate it again.

If you place pictures onto cards and subsequently delete the picture resource from the stack, you must ensure that each instance of the picture in the stack is also deleted. Otherwise you will see the following message at the location of each instance of the deleted picture in the stack: "Cannot display this image. There may not be enough memory or the image could not be found."

The AddColor XCMD has an undocumented selector, "Depth," which returns the current bit depth of the color buffers in the result.

When a stack colored with Color Tools 1.0 is opened for the first time with Color Tools 2.0, the color will disappear momentarily. The disappearance occurs during the conversion of your stack from AddColor 1.0 to AddColor 2.0. Thereafter the color will be displayed normally.

Building Standalone Applications With Color =====

When color is first applied to a HyperCard stack using Color Tools, a set of resources are copied into the stack. The copying of resources is not actually

complete until the stack is closed. If a standalone application is built from the colored stack before the resources have been copied, the standalone application will not work correctly. To avoid this problem, be sure that you have closed and reopened your colored stack at least once before turning it into a standalone application. You should also be certain that the default partition of your standalone application is set to at least 2048K in order for it to display color properly.

Changes To The Getting Started Guide

=====

On page 54 the manual states that images you create or edit in the PICT editor are automatically saved as resources in the current stack. This is true unless you are editing a PICT file which has been placed on a card. Changes made to PICT files which have been placed on a card will be reflected in the file itself and will not be saved as resources in the stack.

On page 57 the manual states that double-clicking the current color indicator in the Color Paint Tools palette will launch the color picker. Actually, it will allow you to edit patterns or gradients.

On page 67 the manual refers to the Paint menu. There is no Paint menu, the specified items are in the Options menu.

On page 71 the picture of the palette is slightly different from the one you will see in the software. The functionality is the same. Additionally, the manual states that you can import MacPaint images with the PICT editor. This is not true. Only PICT files can be imported into the PICT editor. If you wish to use and color a MacPaint file, you can Cut/Paste it into an edit window and then color it.

On page 76 the instructions for quitting the Color Paint Tools are incorrect. To exit the Color Paint Tools, close all paint windows, or choose "Close Paint Tools" from the "File" menu. Closing the Color Paint Tools will return you to the color editor environment.

AWS 95 & A/UX: New Version of 'tc' For DAT-2 Drives (4/95)

Revised: 4/28/95
Security: Everyone

AWS 95 & A/UX: New Version of 'tc' For DAT-2 Drives (4/95)

=====

Article Created: 28 April 1995

TOPIC -----

A new version of the UNIX tape driver, 'tc', for the AWS 95 is available.

DISCUSSION -----

The principal reason for this release is the support of the Hewlett Packard (HP) DAT-2 tape drive. This version of 'tc' also corrects two other problems identified since the release of A/UX 3.1.1 or the AWS 95 Tune-Up 2.0.

- AWS 95 DAT drive does not support multiple "files"
- Tapes can not be reformatted with mt(1) or Retrospect

This module must be installed as root in /etc/boot.d and then the kernel must be reconfigured and the system restarted.

The checksum of the uncompressed module as reported by the sum(1) command is: 24950.

Retrospect accesses the tape using another mechanism (/dev/scsi) and, therefore, already supports the HP DAT-2. This patch is only necessary if the user is using the UNIX tape archival command 'tar(1)', receives a DAT-2 drive, or needs one of the two fixes mentioned above.

PowerShare: Error Code -1660, and Troubleshooting (4/95)

Revised: 4/28/95
Security: Everyone

PowerShare: Error Code -1660, and Troubleshooting (4/95)

=====

Article Created: 28 April 1995

TOPIC -----

I received the following PowerShare error message, "Problem: The server was unable to open folder ID #xx(Error code: -1660)", from the Log window. I also found that the error-catalog-folder does not have a Reliable Trans Log file.

What's causing this to happen? Does the error-catalog-folder need a "Reliable Trans log" file? Do you know any troubleshooting tips?

DISCUSSION -----

The error code -1660 is an internal error (kOCECorruptItemFound) which indicates a corruption was found in the either the Items file or the index to the Items file (ItemsBT). If the problem is in the ItemsBT file, this file can be deleted from the HFS folder, and the server will rebuild it upon restart. If the problem is in the Items file, there is nothing you can do to recover it. You will have to delete the folder from that server and re-replicate (if it was replicated). Otherwise, restore the folder from a backup.

The server only uses the reliabletrans log while the server is running. This file is deleted when the server is shutdown. It is therefore expected there is no Reliable Trans Log in the HFS folder for the catalog folder that is having the problem as you reported.

Color STW 2400: Driver Supports Serial & LocalTalk (4/96)

Revised: 4/10/96
Security: Everyone

Color STW 2400: Driver Supports Serial & LocalTalk (4/96)

Article Created: 1 May 1995
Article Reviewed/Updated: 10 April 1996

TOPIC -----

I added the LocalTalk module to my Color StyleWriter 2400 printer, and there was no additional software with the LocalTalk module. Do I need a new printer driver for the LocalTalk option?

DISCUSSION -----

Because the Color StyleWriter 2400 printer software supports both serial and LocalTalk, no additional printer driver is required.

When you select Color SW 2400 icon in the chooser, the chooser displays available serial ports (printer, modem, or printer/modem) and all networked Color Stylewriter 2400 class printers. This includes the Color StyleWriter 2400 with the localtalk module installed, or GrayShare Color StyleWriter 2200, which are using GrayShare.

All versions of the Color StyleWriter 2400 driver work with all types of networked StyleWriter printers mentioned previously. However, Apple recommends upgrading to version 2.1 or greater of the Color StyleWriter 2400 printer driver. Use the latest version of the Color StyleWriter 2400 printer driver. The article titled "Apple Printers: Printer Drivers & Cables" lists the latest driver versions.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:

10 Apr 1996 - Added latest printer driver version reference.

06 Dec 1995 - Clarified discussion area.

LaserWriter 16/600 PS: Correct Way To Use lpr in UNIX (5/95)

Revised: 5/1/95
Security: Everyone

LaserWriter 16/600 PS: Correct Way To Use lpr in UNIX (5/95)

=====

Article Created: 1 May 1995

TOPIC -----

This article contains a correction to the LaserWriter 16/600 PS Setting Up, Connecting, and Using Your Printer manual.

DISCUSSION -----

In Chapter 4 "Setting Up the Printer for UNIX Users", on page 129 the manual states:

12) Test printing with the following command:
. lp -d printer_IP_name filename

This is incorrect. In order to print properly, you need to use the following:

lp -d print_queue_name filename

In other sections of the manual, it states to use lpr -P printer_IP_name. This is also incorrect, you need to use lpr -P print_queue_name.

For "lpr", the "print_queue_name" is the entry name in the "printcap" file.

For "lp", the "print_queue_name" is generated by the underlying UNIX printer spooler facility.

Macintosh: No Standard RGB Colors (5/95)

Revised: 5/1/95
Security: Everyone

Macintosh: No Standard RGB Colors (5/95)

=====

Article Created: 1 May 1995

TOPIC -----

I am trying to determine what the RGB values used when the Macintosh monitor is set to 256 colors? I want to use these values for a project, and need to know if there is a table of these values available.

DISCUSSION -----

There really are no 'standard colors' used when you set the control panel to 256 colors. Colors are loaded by each individual application when launched on the Macintosh or when an individual file is opened by an application.

The circuitry that controls the colors that are displayed on the screen has a color look-up table (CLUT) and digital to analog converter (DAC). Computer software provides information to the CLUT, which provides color values to the DAC, which provides the correct signals to the display.

The DAC converts the digital number representation of a color pixel into the proper (analog) signal that is used by the display. The digital number is a 24 bit value. The output of the DAC provides the analog Red, Green, and Blue voltage levels that the monitor uses to display the proper colors for each pixel.

The CLUT, when the monitor control panel is set to 256 colors, will display up to 256 different colors that are 24 bits each. In other words, out of an approximate 16 million colors, you can select and display up to 256. The 256 (24 bit) colors that are selected and used are stored and 'looked up' for each pixel that you see on the screen. So what you really have instead of having to choose from only 256 colors is a choice of millions - but you can only select and use 256 colors at a time from the millions that are available.

A DIFFERENT WAY TO LOOK AT IT

It is kind of like having millions of different colored crayons in a storage room to choose from, but for each individual picture you draw, you have a box that only holds 256 crayons. You can only select 256 crayons or colors to use because the box won't hold any more. If you want to draw another picture, you can go back, return the original crayons, and select a completely different group of 256 crayons or colors. The storage room is like the computer and the crayon box that limits the number of crayons you can use for a single picture is the VRAM (if you have more VRAM, you can get more colors).

QuickTime: Where to Get QuickTime Tools (5/95)

=====

Article Created: 1 May 1995

TOPIC -----

I just installed QuickTime 2.0 which came on my system software CD. However, I found out that QuickTime 2.0 did not have QT Convert as did QuickTime 1.0. So I tried to install the QT Convert which came with QuickTime 1.0. However, that didn't work. My question is how can I perform the function of QT Convert with QuickTime 2.0?

DISCUSSION -----

I am not sure what you mean by QT Convert. I cannot find QT Convert on any CD-ROMs that Apple has distributed. Did you mean Convert to Movie 1.0 or Movie Converter 1.0?

If so, the latest version of these tools is ConvertToMovie and it is available in a book and CD-ROM bundle called "QuickTime - The Official Guide for Macintosh Users" by Judith Stern & Robert Lettieri from Hayden Books. This CD-ROM also has several other good QuickTime tools such as MovieShop and MovieAnalyzer.

There are additional developer QuickTime tools available from APDA and online from from ftp sites Apple Computer operates and the Worldwide Web Site:

<http://quicktime.apple.com>

Apple Telecom: Using Fax, Voice and Data Call Detection (7/95)

Revised: 7/11/95
Security: Everyone

Apple Telecom: Using Fax, Voice and Data Call Detection (7/95)

=====

Article Created: 1 May 1995
Article Reviewed/Updated: 11 July 1995

TOPIC -----

I'm trying to get PowerTalk using the GeoPort Telecom Adapter and the Apple Telecom 2.0 Software to work together. It's about 80% working but I've run into the following snags.

When dialing in over Apple Remote Access (ARA), MegaPhone answers but fails to recognize that the call is from ARA, or data, and continues with a voice announcement, then it hangs up after about 9 seconds. Outgoing ARA works OK.

I switched the Advanced Settings to Data Application and the GeoPort did answer the call, but when a voice call comes, it was answered with the MegaPhone message and then the modem squeal.

How do I get this to work?

DISCUSSION -----

This problem is documented in the GeoPort, Telecom Adapter 2.0 Read Me. The Apple Telecom software requires data calling tones in order to automatically detect that an incoming call is a data modem call. The best solution is:

- Set the ARA or data application from which the call originates to send calling tones.

With ARA, if you are using an Express Modem or GeoPort Telecom Adapter with Apple Telecom software, use the 'GeoPort Telecom ARA 2.x/CNG' CCL file. Drag the file from the Telecom Documents folder to your Extensions folder and select this CCL file in the pull down menu of your Remote Access Setup control panel.

With a data application like a BBS or terminal emulation software, if you are using an Express Modem or GeoPort Telecom Adapter with Apple Telecom software, add an 'ATS113=1' to the modem initialization string.

For non-Apple modems, the modem may support the data calling tones necessary for Apple Telecom to perform data call detection. Most 14.4 and 28.8 modems now support the calling tones. The Hayes standard is to add a '^' to the dialing string. For example, with the Hayes 28.8 and Global Village Gold IIv modems, use the command 'ATDT^ 555-1212' to activate the calling tones. Check with your modem manufacturer for support of calling tones or just try a '^' in the phone number.

Two other workarounds are:

- Quit the voice application when you expect a data call.
- Temporarily select Data as the default call type in the advanced options panel of the Express Modem control panel.

Article Change History:

11 Jul 1995 - Update information on ARA detection.

PowerTalk/PowerShare, Digital Signatures, & IP Gateways (5/95)

Revised: 5/1/95
Security: Everyone

PowerTalk/PowerShare, Digital Signatures, & IP Gateways (5/95)

=====

Article Created: 1 May 1995

TOPIC -----

An AppleMail message can be signed using the RSA digital signature and sent to other users through PowerTalk or PowerShare with no problem. However, the same message sent through an IP Gateway and back into PowerTalk from the Internet loses its signature.

DISCUSSION -----

The digital signature information is included in the header of a file. This header information cannot be properly handled by external mail systems and is stripped when forwarded through a gateway.

A workaround is to send signed files as AppleMail enclosures.

PowerShare Mail Delivery Fails with Restricted Privileges (5/95)

Revised: 5/1/95
Security: Everyone

PowerShare Mail Delivery Fails with Restricted Privileges (5/95)

=====

Article Created: 1 May 1995

TOPIC -----

We have a PowerShare system which is not delivering AppleMail. The Catalog browser seems to be working okay since users can see one another and select recipients for messages. However, mail messages remain in the Out Tray. The warning triangle appears in the window indicating the need to resolve a PowerShare error, and clicking on it indicates that the PowerShare server cannot be reached and the error seems unresolvable. PowerShare Admin indicates the Mail Server is running fine.

DISCUSSION -----

Privileges within the PowerShare Catalog can easily be modified in such a way that Mail services will cease. In this case the aoce mailslots, aoce MessageQs, aoce prefMessageQ, and aoce pref mailslot had access privileges set so only the Administrator could see these attributes.

The default settings for these attributes allow Catalog Members to see the records. While in some cases there may be a need to change access privileges for user records, but for most installations the defaults suit their needs.

Earth Explorer Issue With CE Toolbox (5/95)

Revised: 5/8/95
Security: Everyone

Earth Explorer Issue With CE Toolbox (5/95)

Article Created: 1 May 1995
Article Reviewed/Updated: 8 May 1995

TOPIC -----

I found a problem with Earth Explorer. I have a clean system (7.5), with only QuicKeys 3.0.1 installed. My machine is a Power Macintosh 6100/60 with 8 MB of RAM.

The problem is that after I launch Earth Explorer, and choose a sub-topic from one of the topics on the main menu (such as "Explore" or "Hot Topics"), as soon as it is supposed to "link to Explore/Topics", the computer bongs 3 times and the application quits, completely and immediately.

DISCUSSION -----

I have reproduced the problem on a Power Macintosh 8100/100, with 16 MB of RAM, and noticed that both the CE Toolbox and the QuicKeys Toolbox inits were "greyed out" during the init display at startup.

System 7.5 Update 1.0

Installation of the System 7.5 Update 1.0 will resolve this issue. You do not need a new version of QuicKeys.

These articles can help you locate the software update mentioned here:

- Where To Find Apple Software Updates
Lists online services for "free" Apple software updates.
- Obtaining Apple Product Support in the USA
Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library.

System 7.5 Only

..TIL17680-Earth_Explorer_Issue_With_CE_Toolbox_5-95_(TA33675).pdf

If you do not yet have the System 7.5 Update 1.0, but you need to use Earth Explorer right away, try this workaround:

I used the Extensions Manager to turn off the following items, which allowed me to use Earth Explorer successfully after restart:

CEToolbox -- extension
QuicKeys Toolbox -- extension
QuicKeys -- control panel

This article provides some information about a non-Apple product. Apple Computer, Inc. is not responsible for any content referring to this non-Apple product. Please contact the vendor, CE Software, for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

ColorSync 2.0: Compatible Version of LaserWriter Driver (7/95)

Revised: 7/7/95
Security: Everyone

ColorSync 2.0: Compatible Version of LaserWriter Driver (7/95)

=====

Article Created: 2 May 1995
Article Reviewed/Updated: 7 July 1995

TOPIC -----

What LaserWriter driver should I be using to be compatible with the ColorSync 2.0 format? I have a non-Apple PostScript color printer that was ColorSync 1.0 compatible.

DISCUSSION -----

The LaserWriter driver version 8.3 has ColorSync 2.0 support. Unless you already have it, you will also need to acquire a ColorSync 2.0 profile from the manufacturer of their printer.

These articles can help you locate software updates mentioned here:

DOS Compatibility Card: Use VLM.EXE With NetWare (9/96)

Revised: 9/20/96
Security: Everyone

DOS Compatibility Card: Use VLM.EXE With NetWare (9/96)

Article Created: 2 May 1995
Article Reviewed/Updated: 20 September 1996

TOPIC -----

I am trying to connect to a Novell NetWare 3.12 server using a DOS Compatibility Card. However, when I use NETX 3.32 with ETHERNET_802.3 from MS-DOS, I get the error message "Can't connect to a server", and then the application quits.

DISCUSSION -----

Apple has tested NETX.EXE and it seems to function properly, however both Apple and Novell recommend upgrading the workstations to VLM.EXE because of its versatility and smaller memory footprint. Also Novell no longer supports NETX.EXE, so you should use VLM.EXE.

Following is a list of version numbers of the various components Apple Computer tested:

Begin_Table

MACODI.COM	v0.23
LSL.COM	v2.01 and v2.14
IPXODI.COM	v2.11 and v3.01
NETX.EXE	v3.32
VLM.EXE	v1.20
NETX.VLM	v4.20

End_Table

NETX.EXE or NETX.VLM is the DOS requester shell. A configuration error is the likely cause of the error. Typically, "Can't find a server" error messages are almost always related to frame type settings in the link driver section of the NET.CFG file. Here is an sample NET.CFG file to compare with what you are using.

Begin_Table

Note:

In the NET.CFG tabs are important.

SAMPLE NET.CFG

Link Driver MACODI

Protocol IPX 0 ETHERNET_802.3

FRAME ETHERNET_802.3

Netware DOS Requester

FIRST NETWORK DRIVE = F

Link Support

Buffers 8 1500

MemPool 4096

End_Table

Notice that tabs were used to indent.

Connecting a DOS/Windows computer into the same drop and having them operate correctly only indicates that the hardware is functioning correctly. The link driver section has to explicitly name the driver -- in this case MACODI. If you copied a NET.CFG file from another computer, it will not work. Novell Netware 3.x servers default to Ethernet 802.3, while 4.x servers default to 802.2.

AppleShare 4.1: How To Optimize Speed (7/95)

Revised: 7/19/95
Security: Everyone

AppleShare 4.1: How To Optimize Speed (7/95)

=====

Article Created: 3 May 1995
Article Reviewed/Updated: 19 July 1995

TOPIC -----

This article describes how to get the best performance from AppleShare 4.1 on a PowerPC-based computer.

DISCUSSION -----

To get the best performance from AppleShare 4.1 and a PowerPC-based computer, use the following guidelines.

Server

- PowerPC-based Workgroup Server or Power Macintosh
- AppleShare 4.1
- System 7.5 with System 7.5 Update 1.0
- Network Software Installer (NSI) 1.4.5 or later
- Do not have multiple applications running on the server.
For example run AppleShare 4.1 alone, not in conjunction with the Apple Internet Router, Apple Remote Access (ARA), or other server applications.

NOTE: This does not mean you cannot run multiple applications with AppleShare 4.1, this item is specific to those users who want the best possible performance.

- The server should have no less than 5 MB of RAM dedicated to cache, and a starting point toward optimizing cache allocation as follows:
 - 1/4 File buffer cache

- 1/2 Folder cache
- 1/4 Icons

AppleShare 4.1 handles and queues up to three requests from each client. AppleShare's maximum File cache is now 1 MB per user, up from 128 KB. The caching algorithms are also more efficient, and the Icon cache now holds all of the server's desktop files in RAM, rather than just the icons.

Client

- AppleShare Workstation 3.6 client which comes with AppleShare 4.1
- System 7.5 with System 7.5 Update 1.0
- NSI 1.4.5 or later
- On Power Macintosh clients use NSI 1.5, or Built-In Ethernet MACE patch
- SCSI Manager 4.3 or later, and the latest HD drivers

NOTE: Running a remote client on ARA to the network server negates any performance increases, because of the modem connection.

AppleShare Workstation 3.6 uses up to 128 KB of RAM for both read and write caches. Also, the Finder in System 7.5 Update 1.0 copies files in varied portions up to 128 KB instead of 4 KB in earlier versions of the Finder.

ColorSync: Setting Up & Using ColorSync (11/95)

Revised: 11/29/95
Security: Everyone

ColorSync: Setting Up & Using ColorSync (11/95)

Article Created: 3 May 1995
Article Reviewed/Updated: 28 November 1995

TOPIC -----

This article describes what you need to install and use ColorSync and the various components of ColorSync.

DISCUSSION -----

Overview of ColorSync
=====

ColorSync is an extension to QuickDraw. It facilitates color conversion from the color space (method of mathematically describing a color) of one device to the color space of another device. It does this while maintaining consistent visual representation. In simple terms, ColorSync displays and prints the same image that it scanned.

A detailed overview of ColorSync is available in the Tech Info Library article titled "ColorSync Software: Overview".

Installing ColorSync
=====

ColorSync is automatically installed when you install the software from System 7.5, Apple Multiple Scan Displays, Color StyleWriter printers, and QuickTake cameras. It is also available from non-Apple sources that have licensed the ColorSync from Apple.

Installing ColorSync Manually

ColorSync consists of three main components:

- ColorSync extension
- ColorSync System Profile control panel
- ColorSync Profile

You can install ColorSync manually by:

- dragging the ColorSync extension into the Extensions folder.
- dragging the System Profile control panel into the Control Panels folder.
- dragging the ColorSync Profiles folder, with the ColorSync Profiles inside, into the Preferences folder.

Once the components are installed, you need to restart to activate ColorSync.

Note:

If you have a non-Apple ColorSync profile, you need to drag it into the ColorSync Profiles folder located in the Preferences folder.

Setting Up ColorSync

=====

Once you ColorSync is installed, you need to open the ColorSync System Profile control panel and select the correct profile for your output device (monitor, printer, camera, or other device).

If you have a non-Apple output device, you need to contact the product vendor to obtain the proper ColorSync profile.

System 7.5.1: Printing Problems with DeskWriter 560c (5/95)

Revised: 5/3/95
Security: Everyone

System 7.5.1: Printing Problems with DeskWriter 560c (5/95)

=====

Article Created: 3 May 1995

TOPIC -----

I have a Hewlett-Packard DeskWriter 560c and I cannot get it to print from Microsoft Word 6.0. I am using System 7.5 with the System 7.5 1.0 Update (7.5.1), and I do not have this problem with other applications.

DISCUSSION -----

When combining the large memory size of Word 6.0 and Mac OS version 7.5.1, it seems to cause problems with the HP driver. You need to either turn on virtual memory from the Memory Control panel, or raise the amount of memory in the Word 6.0 Get Info window. You will need to change both the preferred and minimum size areas.

Macintosh 630: No Sound in Left Channel (7/95)

Revised: 7/10/95
Security: Everyone

Macintosh 630: No Sound in Left Channel (7/95)

Article Created: 3 May 1995
Article Reviewed/Updated: 10 July 1995

TOPIC -----

After installing the Apple Video Input Module card in my Macintosh 630 family computer, I get sound only from the right channel (red) on the Video Input Module card.

DISCUSSION -----

Grounding the left sound channel on the Video Input Module card is one possible cause of this symptom. The Video Input Module card has an EMI shield around the S-video port that can touching the left sound channel (white) port. This sends the signal to the electrical ground, instead of the speaker.

To correct this, pull the card out of the computer, bend back the EMI shield prongs, so they are no longer touching the left sound channel port, then reinstall the card.

The following computers are in the Macintosh 630 family: Performa 630, Performa 635, Performa 636, Performa 637, Performa 638, LC 630, and Quadra 630.

Power Macintosh: Can't Determine If L2 Cache Is Installed (7/95)

Revised: 7/20/95
Security: Everyone

Power Macintosh: Can't Determine If L2 Cache Is Installed (7/95)

=====

Article Created: 3 May 1995
Article Reviewed/Updated: 20 July 1995

TOPIC -----

Is there anyway to determine if the L2 Cache is installed in a Power Macintosh computer? I have tried several software tools such as, Norton Utilities, Apple Personal Diagnostics, and NOW Profiler, but none of them told me if the L2 Cache was installed. Is this a hardware or software limitation?

DISCUSSION -----

This is not a hardware or software limitation. It is just that implementing a method for checking whether cache memory is available is not a trivial task.

Doing this would involve coding down to the memory controller level, or creating a cache-intensive application which could determine the speed differences when the cache was installed or not.

Note:

Some "shareware" software which performs this test is available, but not from Apple Computer, Inc. Use of and results reported by such software is not supported or endorsed by Apple Computer, Inc. You may be able to find this type of shareware on local electronic bulletin boards or online services.

Basically, there is not an ideal answer to your request for this information. Besides having the customer open their computer to check for the physical presence of the cache, the best a technical support person or technician can do is to check the technical specifications for the Power Macintosh computer in question.

QuickDraw GX 1.1.2: Read Me (5/95)

Revised: 5/3/95
Security: Everyone

QuickDraw GX 1.1.2: Read Me (5/95)

=====

Article Created: 3 May 1995

TOPIC -----

This article contains the ReadMe file for QuickDraw GX 1.1.2.

DISCUSSION -----

What Changed in QuickDraw GX 1.1.2
=====

QuickDraw GX 1.1.2 fixes several problems found since the release of the previous version.

Installation Over Previous Versions
=====

There is no longer a need to delete the Finder Preferences file when installing over a previous version of QuickDraw GX.

Finder Out of Memory Alerts
=====

Some users were encountering multiple Finder out of memory alerts while printing with QuickDraw GX 1.1.1. This problem is fixed in QuickDraw GX 1.1.2.

Crash When Canceling Printing From Power Macintoshes to Networked PostScript Printers
=====

Some users were encountering problems when canceling a print job to a networked PostScript printer. This problem is fixed in QuickDraw GX 1.1.2.

Unable to Print to Tektronix and Hewlett-Packard PostScript Printers
=====

Some users were unable to print to Tektronix and Hewlett-Packard PostScript printers with QuickDraw GX 1.1.1. This problem is fixed in QuickDraw GX 1.1.2.

What Changed in QuickDraw GX 1.1.1

=====

QuickDraw GX 1.1.1 provided performance improvements, a user interface change, and new features.

Performance Improvements

- no "lock out" when downloading fonts to PostScript printers
- font downloading progress shows in the desktop printer window
- prints large character sets, such as Japanese, on printers that do not have these fonts built in
- prints large character sets faster than GX 1.0.2 or the non-GX LaserWriter 8.2 printer driver
- printing dialogs for non-QuickDraw GX applications display more quickly

User Interface Change

When a desktop printer queue is empty (such as after the last job has printed) the page icon goes away rather than turning into the dog-eared page icon.

New Features

=====

Manual Feed Alerts

To turn off the alerts for manual feed printing on PostScript printers, open the Printing menu and choose Disable Manual Feed Alerts.

LaserWriter GX Features

In the PostScript printing dialog box for non-QuickDraw GX applications, two new menus allow you to choose paper types. Use the "First Page On" menu to choose a paper type for the first page. Use the "Remaining Pages On" menu to choose a paper type for the rest of the document.

N-Up Printing Options

The N-Up Printing extension (in your Extensions folder) lets you print up to 16 pages on a single sheet of paper. You can also put an optional border around each page drawn on a sheet.

- To set pages-per-sheet and border defaults for a desktop printer, click the printer icon to select it then choose N-Up Printing Options from the Printing

menu.

- To select pages-per-sheet and border options when you print a document created in a QuickDraw GX-aware application, click the N-Up printing extension icon in the Print dialog box.

- To select pages-per-sheet and border options for a document created in an application that does not support QuickDraw GX, choose Page Setup in the File menu.

PostScript File Options

EPSExtension (in your Extensions folder) lets you configure the PostScript file that is created whenever you print using the LaserWriter GX printer driver.

- You can use the saved file as Encapsulated PostScript for importing graphics into applications that do not support QuickDraw GX, such as Aldus PageMaker, QuarkXPress, and Adobe Illustrator.

- To set EPS options, choose PostScript File Options from the Printing menu.

- EPSExtension is not installed by Easy Install. To get it, you must open the QuickDraw GX Installer and choose Custom Install from pop-up menu. Click the arrow next to QuickDraw GX Utilities to see the list of utilities, and click the checkbox next to EPSExtension to select it. Then click the Install button.

Paper Types

QuickDraw GX 1.1.1 include 3 new paper types for use in configuring the paper tray selections for desktop printers: Letterhead, Stationery, and 3-Hole Punch.

- The new paper types are installed by Easy Install For more information on editing the new papers types or creating your own paper type, you must install the PaperType Editor.

- The PaperType Editor is not installed by Easy Install. To install it, open the QuickDraw GX Installer and choose Custom Install from pop-up menu. Click the arrow next to QuickDraw GX Utilities to see the list of utilities, and click the checkbox next to PaperType Editor to select it. Then click the Install button.

Tips

====

Envelope Paper Types and the LaserWriter GX Driver

The LaserWriter GX printer driver handles three types of No. 10 envelopes. However, each of the three types is designed for a different type of LaserWriter printer. Your choice of envelope should be based on how your printer feeds envelopes from the paper input tray:

- "Envelope - Center Fed" is for printers that feed the envelope in the center of the paper input tray.

- "Envelope - Edge Fed" is for printers that feed the envelope on the left edge of the paper input tray.
- "No. 10 Envelope" is for certain new printers (e.g., the LaserWriter 16/1600PS) that use a different method of determining paper size.

Restoring Type 1 Fonts to Their Original State

If you remove QuickDraw GX from your system, you need to restore your Type 1 fonts. To restore Type 1 fonts, follow these steps:

1. Open the System Folder.
2. Open the Fonts folder.
3. Drag any suitcases that have been enabled to the Trash.
4. Open the •Archived Type 1 Fonts• folder.
5. Move the contents of the •Archived Type 1 Fonts• folder to the Fonts folder.
6. Drag the •Archived Type 1 Fonts• folder to the Trash.

Tekton Plus RegularSC Prints as Courier From Some Applications

In application programs which do not take advantage of QuickDraw GX, Tekton Plus appears as two fonts: Tekton Plus Regular and Tekton Plus RegularSC. Applications such as Adobe Illustrator, QuarkXPress, and Aldus PageMaker print characters from Tekton Plus RegularSC as Courier on PostScript printers.

Troubleshooting

=====

QuickDraw GX and Memory

On a Macintosh with 8 MB of available memory with Macintosh system software version 7.5, QuickDraw GX, and PowerTalk, you can enable only a limited number of printing extensions and desktop printers. More than 7 of each at the same time may cause a low-memory alert to appear. If you want to have more than 7 desktop printers, removing a printing extension will help alleviate memory difficulties and vice-versa. If a low-memory alert does appear, try deactivating printing extensions or removing desktop printers. For more information about desktop printers and printing extensions, see the Macintosh System 7.5 Upgrade Guide.

QuickDraw GX and Application Programs

If possible, do not use the QuickDraw GX Helper (to turn off desktop printing) with WordPerfect versions 3.0 and earlier. In WordPerfect, when you turn desktop printing off, the third item on the Apple Menu (which corresponds to the first alphabetic item in the Apple Items folder) opens. WordPerfect versions 3.1 and later are compatible with QuickDraw GX.

- In PageMaker version 5.0, documents containing PICTs will print without the PICTs and an extra blank page may be printed at the end of some documents. To print correctly, hold down the Option key when you choose Print from the File

menu.

- To print on a PostScript printer using Insignia Solutions' SoftPC and SoftWindows versions earlier than 1.0.2a, you must turn off desktop printing or use the Epson LQ-2500 output option. To turn off desktop printing, use the QuickDraw GX Helper (one of the QuickDraw GX Utilities). To install the QuickDraw GX Utilities, see the instructions in Chapter 3 ("Installing QuickDraw GX") of the Macintosh System 7.5 Upgrade Guide. SoftWindows versions 1.0.2a and later are compatible with QuickDraw GX.

- Adobe Acrobat Reader versions earlier than 2.0.1 and all versions of Adobe Acrobat Exchange are incompatible with QuickDraw GX 1.1.2. Please contact Adobe Systems for upgrade information.

- The substitution fonts included with Adobe Illustrator 5.5 and SuperATM are not compatible with QuickDraw GX 1.1.2. If you install QuickDraw GX 1.1.2 on a Macintosh where these substitution fonts have already been installed, you will see a dialog box which says "The substitution fonts necessary for Acrobat and SuperATM are missing. Please re-install either software package." QuickDraw GX-compatible versions of these fonts are available as part of the Adobe Acrobat Reader 2.0.1 package. Please contact Adobe Systems for more information.

- You should print documents that use the Al-Nashir Al-Sahafi font (Arabic Design Studio) on raster (non-PostScript) printers. If you try to print an Al-Nashir Al-Sahafi document on a PostScript printers, no document will print.

Installing QuickDraw GX with the Power Macintosh Upgrade Card

When you install QuickDraw GX on a Macintosh with the Power Macintosh Upgrade Card, make sure that the upgrade card is enabled before installing QuickDraw GX.

Manual Feed and the LaserWriter IISC GX driver

When you print a manual feed job to a printer using the LaserWriter IISC GX driver, wait for the manual feed alert to appear before inserting the next page. If you insert the page before the alert appears, your printer will print the first page twice and then stop printing. Opening and closing the cover on your printer will clear it.

QuickDraw GX with the Vector Imaging System on the Power Macintosh

There is a problem with the Vector Imaging System and Power Macintosh. If you have problems plotting, turn off Modern Memory in the Memory control panel.

AWS 95: Problems Pinging nameserver (5/95)

Revised: 5/3/95
Security: Everyone

AWS 95: Problems Pinging nameserver (5/95)

Article Created: 3 May 1995

TOPIC -----

I'm setting up a WAIS server on an Apple Workgroup Server (AWS) 95, and I'm having problems pinging nameserver, but not the gateway router.

I can usually ping nameserver right after bringing up the AWS 95, but this capability disappears shortly thereafter. Characteristically when I fire up AppleSearch, the outside Ping and nameserver Ping capability go away.

I have checked the rc and resolv.conf files, and these appear to properly define both the nameserver and the gateway router address.

DISCUSSION -----

The AWS 95 is sending packets to the default route as assigned in the /etc/rc file, but it gets confused when your Telebit NetBlazer router sends out its routing tables every 30 seconds.

The in.routed is the routing software for UNIX, and the AWS 95 comes configured with in.routed set to wait in its /etc/inittab file. When in.routed gets an update from the NetBlazer, in.routed is changing its internal routing tables which means it can no longer reach anything outside of its local subnet.

The solution is to go into /etc/inittab and turn the in.routed to off.

Change the line:

```
net4:2:wait:/etc/in.routed    # set to "wait" for routing
```

to

```
net4:2:off:/etc/in.routed      # set to "wait" for routing
```

Now the AWS 95 will ignore all outside routing information.

Power Macintosh DOS Compatibility and Personal Netware (5/95)

Revised: 5/3/95
Security: Everyone

Power Macintosh DOS Compatibility and Personal Netware (5/95)

=====

Article Created: 3 May 1995

TOPIC -----

We have a Power Macintosh 6100/66 DOS Compatible computer, and we've installed Personal Netware on their DOS machine. We have experienced numerous freezing problems since, and we believe this is associated with Personal Netware. The README.NET that comes with the 6100/66 DOS Compatible computer says "Personal Netware is not supported at this time."

Are there any details on Personal Netware with the Power Macintosh DOS Compatibility Card? Is it unsupported, untested, and/or incompatible? If it is incompatible, can you describe specific behavior?

DISCUSSION -----

As of May 1995, Personal Netware is unsupported and untested on the Power Macintosh DOS Compatibility Card, so we have no specific behaviors to report. Also there are no plans for testing this software.

Apple Remote Access: I Cannot Print To My StyleWriter (5/95)

Revised: 5/3/95
Security: Everyone

Apple Remote Access: I Cannot Print To My StyleWriter (5/95)

=====

Article Created: 3 May 1995

TOPIC -----

I'm using Apple Remote Access (ARA) on my remote Macintosh, and I have a StyleWriter II attached to the printer port. When I want to print, I get an error message saying that the port is in use by another program. When I go to the Chooser to make sure the StyleWriter II is set to the printer port, it tells me I cannot do this while AppleTalk is active. I need AppleTalk to be active when I use ARA. How can I print from my StyleWriter (or any serial printer) from ARA?

DISCUSSION -----

You need to change the AppleTalk connection in the Network control panel. Be sure you are not connect via ARA when you start.

- 1) Go to the Network control panel and click Remote Only. It will give you a message saying that network services will be disconnected. Click OK.
- 2) Go to Chooser, select your printer, and highlight the port to which you have connected the printer.
- 3) Make sure AppleTalk is active in the Chooser window.

You should now be able to print to your local serial printer while either connected, or not connected to ARA.

AppleTalk On AWS 95: Cannot Upgraded With NSI 1.5 (5/95)

Revised: 5/3/95
Security: Everyone

AppleTalk On AWS 95: Cannot Upgraded With NSI 1.5 (5/95)

=====

Article Created: 3 May 1995

TOPIC -----

We recently looked at a client's Apple Workgroup Server (AWS) 95 and found it is running AppleTalk version 56, while the other servers and computers at the site had AppleTalk version 58. Is there any reason not to upgrade the AWS 95 to AppleTalk 58?

Is the process of upgrading the AWS 95 to AppleTalk version 58 any different than on a standard Macintosh?

DISCUSSION -----

Do NOT try to install the latest Mac OS version of AppleTalk from the Network Software Installer (NSI) 1.5 as it is not compatible with A/UX. The AWS 95 uses a special version of AppleTalk, which is designed to run on A/UX. The version will report version 56 when polled, however it is compatible with the latest AppleTalk version 58.

Disable Auto Log On To Nonexistent AppleShare Volume (5/95)

Revised: 5/3/95
Security: Everyone

Disable Auto Log On To Nonexistent AppleShare Volume (5/95)

=====

Article Created: 3 May 1995

TOPIC -----

When my Macintosh boots, an AppleShare log on dialog appears for server volumes which no longer exist on the network. How can I get rid of these attempts to log on to nonexistent server volumes?

DISCUSSION -----

Automatic log on can be disabled by throwing the AppleShare Prep file (System Folder: Preferences: AppleShare Prep) in the trash. Removing this file will eliminate automatic log on for all server volumes. Restoring automatic connection to specific server volumes at startup can be accomplished in the usual fashion.

NOTE: Some third-party software, like Suitcase, will also attempt to mount remote volumes at startup. Vendors should be contacted for instructions on disabling automatic log on their own software.

Resetting The PRAM Causes Loss Of RAM Disk Contents (6/95)

Revised: 6/13/95
Security: Everyone

Resetting The PRAM Causes Loss Of RAM Disk Contents (6/95)

Article Created: 4 May 1995
Article Change History: 13 June 1995

TOPIC -----

During a recent troubleshooting session a friend of mine advised me to reset (or zap) my Parameter RAM (PRAM) as a way to "clear" my serial port. However, neither I nor my friend knew that this procedure would delete my RAM disk and its contents. Why did this happen?

DISCUSSION -----

If you are using a RAM disk, and you reset Parameter Ram (PRAM) (by simultaneously holding down the Command-Option-P-R keys at the initial startup chime) the settings in the Memory control panel revert to their factory defaults.

The default setting for a RAM disk in the Memory control panel is "off". As a result, any contents on a previously active RAM disk are lost when the PRAM is reset.

This happens regardless of whether or not the RAM disk is the startup disk. The presence of the Assistant Toolbox extension (on a Powerbook computer) does not prevent this data loss. Therefore, Apple recommends backing up all important items from a RAM disk to another disk before resetting the PRAM.

NOTE: Simply restarting the machine does not purge the contents of the RAM disk. However, selecting Shut Down from the Special menu or powering the machine off from the power switch erases the contents of the RAM disk (unless the Assistant Toolbox extension [for PowerBook computers] or similar utility [for other Macintosh computers] is installed). If the machine is shut down in this manner the contents of the RAM disk cannot be retrieved even if it is immediately restarted.

A/UX: ftp Autologin (5/95)

Revised: 5/4/95
Security: Everyone

A/UX: ftp Autologin (5/95)

=====

Article Created: 4 May 1995

TOPIC -----

The A/UX man pages provide instructions for setting up the ftp Autologin process by creating a .netrc file. However, I can't seem to get this file to work.

DISCUSSION -----

The documentation provides a description for entries in the .netrc file, but fails to note the order of execution. For the file to work, the machine name of the remote system needs to be the first entry. This would be followed by login, password, and then any macdef entries for ftp macros.

LaserWriter 16/600 PS: NetWare 4.1 Printing Issues (1/96)

Revised: 1/24/96
Security: Everyone

LaserWriter 16/600 PS: NetWare 4.1 Printing Issues (1/96)

Article Created: 4 May 1995
Article Reviewed/Updated: 24 January 1996

TOPIC -----

I cannot set up our LaserWriter 16/600 PS printer to work on a NetWare 4.1 Server. Everything worked fine under Netware 3.1x.

DISCUSSION -----

You can configure the printer in PSERVER mode by using PCONSOLE. The steps are outlined below.

Note:

You can only print with the banner page turned "off", and you must verify that the Netware Ethernet port is set to "AutoSelect" using the Apple Printer Utility.

You also have the option to print to the LaserWriter 16/600 by installing and configuring Netware for the Macintosh. You should contact Novell for instructions on how to do that.

NetWare v4.10 QuickStart
=====

Setting up PSERVER operating mode

Background:

The change from NetWare v3.xx to NetWare v4.xx introduced the concept of a hierarchical tree database, called NetWare Directory Services (NDS). This object-oriented database is significantly different than the flat file style of database used in NetWare v3.xx (called the Bindery). In order for NDS to be backward compatible with the old Bindery, and code that may rely on the Bindery (such as printer ROM code), NetWare has a command called SET BINDERY CONTEXT, that allows a single level of the NDS directory tree to be specified as a

virtual Bindery location. A NetWare v4.xx server's bindery context can be found by typing SET BINDERY CONTEXT at the console prompt.

The super user account name has changed with NetWare v4.xx to Admin from NetWare v3.xx's name of Supervisor. The Supervisor account still exists in NetWare v4.xx for backwards compatibility, but it can't actually be seen in the NDS directory tree. The Admin account gives you full access to the entire NetWare Directory Services tree, the Supervisor account will only let you see objects that are in its Bindery context location in the tree. To follow the steps listed below, you should use the Admin NDS account.

Summary:

- Create a print server.
- Create a printer from within the print server configuration menu options.
- Create a print queue from within the printer configuration menu options.
- Turn printer off and then back on to have changes take effect.

QuickStart:

Step 1

Use the Apple Printer Utility to print a configuration page.

Note:

There are occasions when the printer name on the startup page differs from the printer name on the configuration page. If this happens, the name on the configuration page is the correct name of the printer.

Step 2

Type SET BINDERY CONTEXT at the server's console prompt, to ensure that the context has been set. Write the context down, as it will be needed later.

Step 3

Login to a file server from a DOS client using the Admin account.

Step 4

At the DOS prompt, type PCONSOLE, and press Enter.

Step 5

Use the arrow keys to highlight Change Context in the menu, and press Enter.

Step 6

Change the PCONSOLE utility's context to match the context set on the server

(what you wrote down earlier), by pressing the Insert key, and selecting the correct context.

Step 7

Use the arrow keys to highlight Print Servers in the menu, and press Enter.

Step 8

Press the Insert key, then type the NetWare Printer Name (provided on the printer's startup page), and press Enter.

Note:

Even though the startup page calls this name the NetWare Printer Name, it really will be used as the NetWare Print Server name.

Step 9

Select the name of the print server you specified in the previous procedure and press Enter.

Step 10

Use the arrow keys to highlight Printers in the Print Server Information menu, and press Enter (this will let you configure the new print server).

Step 11

Press the Insert key to display printers in your current context in the NetWare Directory Services tree. For this example, we will create a new printer.

Step 12

Press the Insert key to create a new printer in the NetWare Directory Services tree (the context listed at the top of the screen should still list the server's bindery context that was set earlier, if not, change to the correct context *before* creating the printer!).

Step 13

At the prompt, type the new printer name and press Enter. This name will be used for reference, so use a name that will be meaningful to the NetWare administrator, or other users who may wish to check on the printer's status. This step will create the printer object in the NDS tree.

Step 14

Select the name of the printer you specified in the previous procedure and press Enter (this will add the printer to the Serviced Printer list of the print server).

Step 15

From the Serviced Printers menu list, select the name of the printer you specified in the previous procedure, and press Enter. This will bring up a Printer Configuration menu.

Step 16

From the Printer Configuration menu, use the arrow keys to highlight Printer type, and press Enter.

Step 17

From the Printer Type menu, use the arrow keys to highlight Other/Unknown, and press Enter. This will make your selection active, and bring you back to the Printer Configuration menu.

Step 18

If most of the printing to this printer will be Postscript, and not PCL, then from the Printer Configuration menu, use the arrow keys to highlight Banner type, and change the banner type from Text to Postscript. This will limit the number of times the printer will have to switch modes between PCL and PostScript.

Step 19

From the Printer Configuration menu, use the arrow keys to highlight Print queues assigned, and press Enter. This will bring up the Print Queue menu list.

Step 20

Press the Insert key to display print queues in your current context in the NetWare Directory Services tree. For this example, we will create a new queue.

Step 21

Press the Insert key to create a new print queue in the NetWare Directory Services tree (the context listed at the top of the screen should still list the server's bindery context that was set earlier, if not, change to the correct context **before** creating the print queue!).

Step 22

At the prompt, type the new queue name and press Enter. You will then be asked for the NetWare volume to store your NetWare print queue jobs on. With NetWare v4.xx, the NetWare queue does not have to exist on the SYS volume -- you can place the queue on any volume you want. Use the insert key to select the volume from the directory tree (you may need to navigate to a different context to select the volume desired).

Step 23

Select the name of the queue you specified in the previous procedure and press Enter (this will add the queue to the Print Queue list of the printer).

Step 24

Press the Escape key until you are prompted to save your changes.

Step 25

Turn the printer off, and then back on again, to initialize the printer, and have it connect to its printer definition within NetWare.

Step 26

Submit a print job to the printer to ensure it is working. If printing from a PC, it is highly recommended that you use the FONTLIST.PS file in SYS:SYSTEM\NW-MAC\PSUTILS, since it is a known good file, and you will not add additional variables like misconfigured applications or drivers. Once you know that printing is working through the queue, you can use more complex print setups to ensure your environment is configured correctly.

Note:

These series of steps is only one of many ways that can be used to create the same configuration. For example, rather than creating all the printers and print queues from within the print server main menu option, many administrators may choose to create the queues and printers from the main menu options first, then connect the queues and the printers to the print server afterward. The same result will be reached in each case, as long as the information in each entry is entered the same way in whatever approach is taken.

AWS95 & A/UX Compatible: LaserWriter & LocalTalk Bridge (6/95)

Revised: 6/2/95
Security: Everyone

AWS95 & A/UX Compatible: LaserWriter & LocalTalk Bridge (6/95)

=====

Article Created: 4 May 1995
Article Reviewed/Updated: 2 June 1995

TOPIC -----

Can I use the Apple LocalTalk Bridge 2.0, Apple LaserWriter Bridge 2.0, or LaserWriter Bridge 1.0 on an Apple Workgroup Server (AWS) 95 or A/UX system?

DISCUSSION -----

The LaserWriter or LocalTalk Bridge software is not compatible with A/UX, therefore this bridge software cannot be run on A/UX or AWS 95 systems. This Bridge software needs AppleTalk version 57 or higher to operate, while the AppleTalk implementation in A/UX is based on AppleTalk version 56. If you install the software, you will receive a message like the following:

A/UX machines can be setup to router TCP/IP packets. However, the UNIX features do not include AppleTalk routing. A/UX does not support the Apple Internet Router either.

However, an A/UX system can print to a printer connected to a LocalTalk network via the LaserWriter or LocalTalk Bridge.

NSI 1.5 and Third-Party Ethernet Cards (5/95)

Revised: 5/4/95
Security: Everyone

NSI 1.5 and Third-Party Ethernet Cards (5/95)

Article Created: 4 May 1995

TOPIC -----

We have several different types of third-party Ethernet Cards. Does the Network Software Installer (NSI) 1.5 support any third-party Ethernet Card? If yes, please tell us which company's one would be supported ?

DISCUSSION -----

Below is an excerpt from the NSI 1.5 Read Me:

"If you are using 3rd party ethernet cards: The drivers contained in the new driver files do not support 3rd party ethernet cards. A 3rd party card that has duplicated an Apple ethernet board will use the appropriate ethernet driver from the system file instead of the Apple driver in the extensions folder file. A system with a 3rd party ethernet card will continue to operate using the previously-installed driver after installing this version of the Network Software Installer. Such systems will get the benefit of all of the other updates installed by this Network Software Installer, including the ability to install and use the LaserWriter Bridge."

This means NSI 1.5 does not support any third-party Ethernet cards. However, installation of NSI 1.5 will not disable a third-party card that has previously been working with older Apple Ethernet drivers.

With NSI 1.5, Ethernet drivers are now individual files located in the Extensions folder. These files are loaded at startup by a new network software loading mechanism. Previously, Ethernet drivers were resources located in the System file that were loaded at startup.

This new mechanism only works with Apple Ethernet cards or Built In Ethernet. The mechanism will only load the new Ethernet driver files if an Apple Ethernet card/Built In is detected. If a non-Apple Ethernet card is detected, the mechanism will not load the new Ethernet driver files for the card. Instead, it will check for the presence of a suitable driver within the system file. If one

is found, it will be loaded for the card. Otherwise, no driver will load for the card and the card will not function.

LaserWriter Bridge v2.0: Using With Non-Apple Printers (5/95)

Revised: 5/16/95
Security: Everyone

LaserWriter Bridge v2.0: Using With Non-Apple Printers (5/95)

=====

Article Created: 5 May 1995

TOPIC -----

I'm having a problem with the LaserWriter Bridge software v2.0 included with the Network Software Installer (NSI) 1.5 seeing a Hewlett Packard (HP) LaserJet 4ml printer on a Power Macintosh 6100/60. When I switch to LocalTalk the printer works properly. I have also tried an Apple LaserWriter connected to the Power Macintosh and that worked properly through the LaserWriter Bridge software. I'm using the LaserWriter 8 driver.

Are there any known compatibility problems with third-party printers and the LaserWriter Bridge v2.0 software?

DISCUSSION -----

There are no known issues involving third-party printers and the LaserWriter Bridge 2.0. A printing device that responds to an NPB lookup as type "LaserWriter" should work.

Try using the LaserWriter 8.2.2 driver to see if that makes any difference, this version of the LaserWriter driver addresses an issue when clients and printers are located in different zones with the same network number. Since you did not provide any details of your network, this may or may not help.

AppleShare 4.1 and Power Macintosh Upgrade Card (5/95)

Revised: 5/5/95
Security: Everyone

AppleShare 4.1 and Power Macintosh Upgrade Card (5/95)

=====

Article Created: 5 May 1995

TOPIC -----

Is the new AppleShare 4.1 compatible with Power Macintosh Upgrade Card?

DISCUSSION -----

No version of AppleShare File Server or Print Server is supported on computers equipped with either the Power Macintosh Upgrade Card or the Macintosh Processor Upgrade. Although the software may run without crashing, it is untested and therefore, unsupported.

There is little to be gained by running a server on a system with an upgrade card since all the upgrade card does is increase the processor's power. The server is heavily dependent on the I/O subsystems, which are unchanged, and therefore the performance increase is not significant.

Finder Search Path For Applications (5/95)

Revised: 5/31/95
Security: Everyone

Finder Search Path For Applications (5/95)

=====

Article Created: 8 May 1995
Article Reviewed/Updated: 31 May 1995

TOPIC -----

When I open a document and have multiple versions of the application that created it on my hard drive, how does the Finder determine which version of the application to open?

DISCUSSION -----

The Finder searches for the correct application based on the "creator type" of the document. The search path the Finder uses is as follows:

Step 1

The Finder first checks to see if an application with the same creator is already running.

Step 2

The Finder searches the volume containing the document being opened.

Step 3

The Finder searches the startup volume.

Step 4

The Finder searches the rest of mounted volumes.

In the event of multiple versions of the same application on one volume, the Finder launches the application whose record in the desktop database was updated last. This is usually the last version installed.

The Finder stops searching at the first version of the application it finds. Here is a simple test to demonstrate this behavior.

Step 1

Make a copy of the SimpleText application.

Step 2

Put the new copy in the Trash, but do not Empty the Trash.

Step 3

Double-click a SimpleText document on the same volume as the original SimpleText application to open SimpleText.

Step 4

The Finder displays a message stating the application cannot be used because it is in the Trash, even though there is another copy that is not in the Trash.

MAE: HP700 & Moving /users To New Disk (5/95)

Revised: 5/8/95
Security: Everyone

MAE: HP700 & Moving /users To New Disk (5/95)

=====

Article Created: 8 May 1995

TOPIC -----

What is the best way to move the /users to a new disk on a Hewlett Packard (HP) Series 700 Workstation? As MAE creates System Folders in each user's directory, there is a need to increase storage. What concerns are there with MAE in respect to a new file system?

DISCUSSION -----

While Apple does not support this task, it is important to be sure that the new a File System supports more than 14 characters. When using the utility called SAM (System Administration Manager) to create a new File System, it will default to supporting file names up to 14 characters. Be sure that when adding a File System within SAM, that the option for Long File Names is selected.

Here are the steps for moving /users to a new disk and creating a new file system with SAM:

Step 1

Create a temporary directory and move the contents of /users to /users.temp:

```
#mkdir /users.temp
#cd /users
#find . | cpio -pdumv /users.temp
#cd /
#rm -rf /users/*
```

Step 2

Start SAM to create a new File System:

```
#sam &
-Select "Disks & File Systems" -> "CD-ROM, Floppy and Hard Disks"
```

- Select the new SCSI Drive, highlight 'Action' and select 'Add a Hard Disk'
- Select 'Modify Defaults' and select "Use Long File Names"
- Select OK and mount the new File system to /users
- exit SAM

Step 3

Move contents from /users.temp to /users and remove the temp directory:

```
#cd /users.temp
#find . | cpio -pdumv /users
#cd /
#rm -rf /users.temp
```

The /users is now located on the new file system that supports long file names, allowing MAE to properly create long file names on that file system.

MAE: File Names Are Truncated To 14 Characters (5/95)

Revised: 5/8/95
Security: Everyone

MAE: File Names Are Truncated To 14 Characters (5/95)

=====

Article Created: 8 May 1995

TOPIC -----

Running HP-UX, we mounted /users on a separate physical file system. I am able to create a new System Folder within my home directory, however, some of the file names are shortened to 14 characters. This is apparent in the System Folder, where the Apple Menu Items folder has been reduced to "Apple Menu Ite". After renaming the file, and restarting MAE the same problem remains. What is happening?

DISCUSSION -----

Using the SAM (System Administration Manager) utility in HP-UX, creation of File Systems will default to a limit of 14 characters (referred to as 'compatible' in SAM).

SAM lets you convert the File System to the Long File Names without having to reformat the drive. Follow these steps:

Step 1

Start SAM as root

#sam

Step 2

Select "Disks and File Systems" -> "Local File Systems", highlight the SCSI disk that contains the /users directory.

Step 3

Highlight 'Actions' and choose 'Convert to Long File Names'

SAM will convert the file system to accept file names longer than 14

characters.

PowerBook 500 & 150 Series:How To Backup System 7.5 Disks (8/95)

Revised: 8/31/95
Security: Everyone

PowerBook 500 & 150 Series:How To Backup System 7.5 Disks (8/95)

=====

Article Created: 8 May 1995
Article Reviewed/Updated: 31 August 1995

TOPIC -----

This article describes how to create backup System 7.5 installation disks from the pre-loaded system installation folders on a PowerBook 500 series hard disk.

DISCUSSION -----

Macintosh PowerBook 500 series computers that are configured with less than 12 MB of RAM ship with a System 7.5 Installation folder pre-loaded on the hard drive. In the accessory kit which comes with these computers you will find a set of System 7.1.1 floppy disks.

System 7.1.1 is the version of the system software installed on Macintosh PowerBook computers with less than 12 MB of RAM. To make 7.5 installation disks from the System 7.5 Installation folder on the hard drive follow these steps:

Step 1

Locate the Install Disk 1 folder. Copy the contents of that folder to a disk with the same name as the folder.

Step 2

Rename Installer on Disk 1 to "Finder". This will allow the disk to be a startup disk.

Step 3

Repeat Step 1 for each of the following

Install Disk 1
Extensions (folder)

- Finder (previously named Installer)
- Preferences (folder)
 - System
 - System 7.5 Installation

- Install Disk 2
 - Installation Tome 2
 - System Morsels

- Install Disk 3
 - Installation Tome 3

- Install Disk 4
 - Installation Tome 4

- Install Disk 5
 - Installation Tome 5

- Install Disk 6
 - Installation Tome 6

- Install Disk 7
 - Installation Tome 7

Creating a Disk Tools Disk
=====

Step 1

Unlock and initialize a floppy disk. Name it Disk Tools.

Step 2

Make a folder on the Disk Tools called "System Folder" and put the system and finder in it. (Otherwise you get 7 other items created beside the HD SC Setup and Disk First Aid)

Step 3

Drag the system file from the Install Disk 1 folder to the newly initialized Disk Tools disk. The pathway on the PowerBook hard drive is: System 7.5>Installation>System Install>Install Disk 1.

Step 4

Drag Apple HD SC Setup and Disk First Aid to the Disk Tools disk. The pathway on the PowerBook hard drive is: System 7.5>Installation/Disk Tools.

Step 5

Drag the Finder from the System Folder to the disk (Finder is version 7.1.3).

Step 6

Drag the Disk Tools disk to the Trash to eject it.

Step 7

Restart from the Special menu and immediately insert the Disk Tools disk. The PowerBook will start up from the disk.

Step 8

You should get a message asking if you want to rebuild the desktop. Click yes.

Step 9

Shutdown from the Special menu. The Disk Tools disk will eject.

Step 10

Lock the disk.

Note: An alternate way to make a System 7.5 Disk Tools disk is to use a disk duplication application, such as Apple Disk Copy 4.2, to make a duplicate of the 7.1.1 Disk Tools. Then on the copied Disk Tools disk throw away the Disk First Aid and HD SC Setup applications and replace them with the ones in the Disk Tools folder on the PowerBook hard drive.

Article Change History:

31 Aug 1995 - Added information about how to create a Disk Tools disk.

Color StyleWriter 2400: Vertical Lines in printouts (2/96)

Revised: 2/27/96
Security: Everyone

Color StyleWriter 2400: Vertical Lines in printouts (2/96)

Article Created: 9 May 1995
Article Reviewed/Updated: 27 February 1996

TOPIC -----

I am having problems with my Color StyleWriter 2400 printer. When I print certain documents, I have vertical lines running through the images in the document. The lines appear to be thin strips of the image picked up and moved a little to the right. These artifact lines are most easily seen in Black & White mode, however the lines also occurs with color images.

DISCUSSION -----

Vertical lines in your printouts occur only if ALL the following are true:

- Documents have bitmapped (PICTs or TIFFs) images in them.
- Page Setup orientation is set to Landscape.
- Best Mode is used.
- A Power Macintosh computer is Used.

Any other combinations of print settings do NOT reproduce vertical lines.

To prevent the vertical lines, use the Color StyleWriter 2400 v2.1 or greater printer software.

DOS Compatibility Card: Windows For Workgroups Q&A (5/95)

=====

Article Created: 9 May 1995
Article Reviewed/Updated: 29 September 1995

TOPIC -----

This article contains Q & A pairs about using Windows for Workgroups on a Power Macintosh DOS Compatibility Card.

DISCUSSION -----

Question: Which network drivers and frame types need to be used Windows for Workgroups in order to communicate with a Windows NT server? Can I just load Ethernet_II and Ethernet_802.3 frame types, or must I load all four frame types?

Answer: Windows for Workgroups 3.11 adds all 4 frame types to both the NET.CFG and the PROTOCOL.INI file. This seems to indicate all 4 frame types are required. In addition, Chapter 8 of the "Microsoft Windows for Workgroups Resource Kit - Addendum for Operating System Version 3.11" indicates all 4 frame types are needed. The specific driver needed in the Network Setup for Windows NT connectivity is "IPX/SXP Compatible Transport With NetBIOS". A complete discussion of your questions are in Chapter 8 of the "Microsoft Windows for Workgroups Resource Kit - Addendum for Operating System Version 3.11".

Question: I was told that it is important to load the various frame types in the same sequence in both the NET.CFG and the PROTOCOL.INI files. Is this true?

Answer: We have not seen behavior that would indicate this is the case, but it is considered good form to have them listed in both files in the same order. Again, see Chapter 8 of the "Microsoft Windows for Workgroups Resource Kit - Addendum for Operating System Version 3.11"

Question: Are there any issues we need to be aware of concerning the various files that are listed after "network", "netmisc", and "transport" in the

[386Enh] section of SYSTEM.INI? Some documentation I have seen from Novell suggests that some of these files perhaps should be replaced with others of different names.

Answer: Chapter 8 of the "Microsoft Windows for Workgroups Resource Kit - Addendum for Operating System Version 3.11" contains all the information you need on this topic.

Question: I understand that the latest Netware Client from Novell includes many of "patches" and replacement drivers for both its products and for Microsoft's Windows and Windows for Workgroups. I also know that both Microsoft and Novell make "patches" and replacement drivers available to users. Is it generally a good idea to use the most recent versions of the "patches" and replacement drivers, or should we use specific versions only?

Answer: Unless Apple finds problems with new drivers and the DOS Compatibility Card, it is always good to use the latest versions of software from the original vendors. If there are problems with drivers, they will be published in the Tech Info Library.

See Chapter 8 of the "Microsoft Windows for Workgroups Resource Kit - Addendum for Operating System Version 3.11" for a listing of version number requirements for Windows for Workgroups 3.11 and Novell Netware connectivity.

HyperCard: Popup Buttons And Shared Hilite (7/95)

Revised: 7/19/95
Security: Everyone

HyperCard: Popup Buttons And Shared Hilite (7/95)

Article Created: 9 May 1995
Article Reviewed/Updated: 19 July 1995

TOPIC -----

In HyperCard versions 2.2 and 2.3, the "shared hilite" feature of the popup buttons does not seem to be working as expected. We expect that when this option is off, that each card can have its own value selected from the popup list, and it will stay that way for that card. But we see is that when one changes the value on one card, all the other cards change as well.

Is this a bug in Hypercard, or am I misunderstanding what this feature is supposed to do?

DISCUSSION -----

Shared Hilite Overview

Shared Hilite is primarily intended for use with check boxes and radio buttons. Using Shared Hilite only affects the behavior of the boolean "hilite" property. Popup menus do not use the hilite property for selecting their values, but instead use the selectedLine, selectedLoc, and selectedText properties. Since Shared Hilite only affects the value of the hilite property, you need to write a script to change the selected value of your popup menus from one card to the next.

How It Works

The sharedHilite property controls whether background buttons use a common value for the highlight state on each card of a background (determined by the hilite property), or that value is unique for each card in the background. The key part in this explanation is that sharedHilite only controls the behavior of the hilite property. The hilite property is boolean -- it is either true or false.

- If a button's hilite property is set to "true", then the button appears highlighted (unless it is a popup menu).

- If a button's hilite property is set to "false", then the button appears normally (not highlighted).

Popup buttons do not have a highlighted state, so they look the same, regardless of hilite's value. Although their appearance does not change, HyperCard remembers the settings of the hilite property for popup buttons. (Note that clicking on a popup menu or selecting an item from a popup does not affect the value of the hilite property.)

Every version of HyperCard since version 2.2 can treat buttons as containers, which lets them store values, just like fields. This is the basis for popup buttons. When you click on a popup button, it displays the contents of the button in the popup menu. When you select a value from the popup, it selects that value and records the appropriate information into selectedLine, selectedLoc, and selectedText.

HyperCard does not have the ability to automatically change a popup menu's selection as a user switches cards. You need to write your own scripts to change the button's value.

If a stack had a popup menu called "theButton", the user could create a field called buttonValue and use the following background script:

```
on closeCard
  put the selectedLine of bg btn theButton into fld buttonValue
end closeCard

on openCard
  get word 2 of fld buttonValue
  select line it of bg btn theButton
end openCard
```

MAE: Forcing AppleDouble File Format (5/95)

Revised: 5/10/95
Security: Everyone

MAE: Forcing AppleDouble File Format (5/95)

=====

Article Created: 10 May 1995

TOPIC -----

I'm copying a TIFF file from a Macintosh CD-ROM into MAE and then trying to view it, but my viewer application will not work. What can I do?

DISCUSSION -----

This sounds to us like an AppleSingle, AppleDouble file format problem. MAE is converting the file from HFS format from the Macintosh CD-ROM to a format compatible with the UNIX file system. The Macintosh file system has a resource fork and data fork which the UNIX file system does not have or understand.

We think you are trying to view the TIFF file with a UNIX TIFF viewer, if you had an Macintosh-based TIFF viewer, the file would open properly because MAE stores most files and can read AppleSingle file format. Text documents and an exception, which are stored AppleDouble file format.

You can force MAE to save files in AppleDouble format by using one of the following:

- Launch MAE with the -filedouble option.

mae -filedouble

- You can force MAE to write in AppleDouble format by setting environment variable TBFILEFORMAT to 1.

NOTE: This feature is NOT supported.

MAE: Umlauts and Other UNIX Compose Key Characters (5/95)

Revised: 5/10/95
Security: Everyone

MAE: Umlauts and Other UNIX Compose Key Characters (5/95)

=====

Article Created: 10 May 1995

TOPIC -----

I'm using MAE 1.0 on a Sparc20 with Solaris 2.4. My keyboard has a US layout, so I selected sun.type5.US in the MAE Keyboard control panel.

How do you type umlauts with a US keyboard? I have already tested all combinations of ctrl-, cmd- and shift-keys.

DISCUSSION -----

You can use Key Caps from the Apple menu. Key Caps shows you the keys settings when holding down the shift, option, or shift and option together. For example if you hold down the Option key, you can see how the mapping changes.

The umlaut is a "dead key" and is properly mapped by the Mac OS. That is, when you press the key combination to get an umlaut, you don't see the character until you press the letter that the umlaut is to appear over. For example, the keystrokes Option-u, followed by "u" will produce an umlaut over the letter "u".

Make sure you know where the Option and Command keys are mapped in MAE. For convenience, you may want too map them to the same physical location on the workstation keyboard as they are on a Macintosh keyboard, but this is not necessary. You can use the MAE Keyboard control panel to check their location and remap them if desired.

Several third-party Macintosh developers provide Apple menu item and control panel device utilities that also provide this functionality.

You can also try to map the same key combination you normally use in X Windows, for example map the dead key or compose key that X Windows use in MAE. Search for Tech Info Library article titled "MAE: Keypad Mapping On Solaris & Some Mac Applications" for more information

MAE: Keypad Mapping On Solaris & Some Mac Applications (5/95)

Revised: 5/10/95
Security: Everyone

MAE: Keypad Mapping On Solaris & Some Mac Applications (5/95)

Article Created: 10 May 1995

TOPIC -----

When I run certain applications with keypad shortcuts in MAE on a Solaris workstations, the mapping is not correct. For example, some of Microsoft Word's keyboard shortcuts require the keypad, but the Solaris workstation maps the keypad to arrow keys and dead keys. I have tried several MAE Keyboard control panel settings to remap the keypad without luck. What can I do to change the keypad mapping?

DISCUSSION -----

To change the settings in MAE you need to change the keyboard mappings for the entire Open Windows environment. Follow the steps below to configure the keyboard map to let the keypad function in MAE

NOTE: Doing this may effect applications that have dependencies on those default settings.

Step 1

Create a file in the home directory titled ".Xmodmap" with this command:

```
xmodmap -pke > $HOME/.Xmodmap
```

Step 2

Edit the file you just created, by locating each keycode that references the keypad, listed as KP_x, where x is either the numeric or function key. Remove entries to the right of the "=" sign, with the exception of the value you wish to keep. Here are some examples from a \$HOME .Xmodmap file:

```
keycode 53 = KP_Divide  
keycode 54 = KP_Multiply  
keycode 97 = KP_Enter
```

```
keycode  98 = KP_4
keycode  99 = KP_5
```

NOTE: If you do not intend to use applications that require the keypad, or need the default map for other applications, you will not need to edit the .Xmodmap file.

Step 3

Add the follow entries to /usr/openwin/lib/Xinitrc.

- Add these lines after the reference to "xrdp" which is the first section of the Xinitrc file. This dumps the default mapping to a holding file, and loads your modified mapping:

```
xmodmap -pke > $HOME/.Xmodmap.default
xmodmap $HOME/.Xmodmap
```

- Add this line after the reference to "wait \$wmpid", this removes the configured mappings and returns to the default:

```
xmodmap $HOME/.Xmodmap.default
```

You should open Key Caps in the Apple menu after the next log in to MAE, to make sure the keys selected on the keypad are properly mapped by seeing the same key highlighted in Key Caps.

DOS Compatibility Card: Lantastic Not Supported (5/95)

Revised: 5/10/95
Security: Everyone

DOS Compatibility Card: Lantastic Not Supported (5/95)

=====

Article Created: 10 May 1995

TOPIC -----

I am trying to get Lantastic to work on the DOS Compatibility Card for the Power Macintosh. However, when I try to get it to connect on the network, it cannot see any other MS-DOS computers. I connected the DOS Compatibility Card to a Novell network, and everything worked properly. How can I get the DOS Compatibility Card to work with Lantastic?

DISCUSSION -----

Lantastic has not been tested, nor is it supported on the Power Macintosh 6100 DOS Compatible or DOS Compatibility Card. While it may be possible to get it to work, Apple does not have any information on how to do so. You should contact Artisoft and work with them on finding a solution. Since Lantastic is an unsupported software package on the DOS Compatibility Card, Apple cannot provide you with any additional support.

LaserWriter Fax: Reducing VMerrors Sending to Lrg Groups (5/95)

Revised: 5/10/95
Security: Everyone

LaserWriter Fax: Reducing VMerrors Sending to Lrg Groups (5/95)

=====

Article Created: 10 May 1995

TOPIC -----

Occasionally I get a VMerror when sending a fax to large groups (a group fax of about 240 people). I have to turn the printer off and on for the next job to continue, but then after another 10 jobs I get the VMerror again.

Is this something that should work? Any reason why we get these VMerrors on the printer?

DISCUSSION -----

There is no limitation set by the driver to the number of addresses you can send at one time. It does, however, depend on how the printer handles the addresses and sends the information.

You should try using the Broadcast option next time you have to fax to a large group. This might help you alleviate the problem. After selecting "Fax" as the destination in the Print dialog, the next dialog that appears (Fax Destinations) has the "Broadcast using" popup field at the bottom where you can select "Computer" or "Printer". If "Computer" is selected, a separate fax job is created in PrintMonitor for each person in the group. If "Printer" is selected, then only one print job (for the entire group) is sent in PrintMonitor, and the printer handles sending the faxes to the individuals in the group.

Overall, this appears to be a VM (printer's Virtual Memory) constraint. Adding more VM in the printer, by adding more RAM, should increase the number of addresses per job.

MAE: Disk Copy and DART Image Files (5/95)

Revised: 5/10/95
Security: Everyone

MAE: Disk Copy and DART Image Files (5/95)

=====

Article Created: 10 May 1995

TOPIC -----

I have Disk Copy and DART disk image files to load software, but I cannot get them open. I have tried using Mount'em without success either. Is there any software available so these image files can be used?

DISCUSSION -----

We have used ShrinkWrap to mount Disk Copy and DART image files in MAE 1.0a. ShrinkWrap is freeware written by Chad Magendanz. To mount an image you drag the image file onto the ShrinkWrap icon. Also be sure to set the preferences by clicking to select store in memory.

You can find ShrinkWrap at most Macintosh ftp sites including:

<ftp://mirror.aol.com/pub/mac/util/diskfile/shrinkwrap1.21.sit.hqx>

GeoPort 1.x: System 7.1.x and System Update 3.0 Install (5/95)

Revised: 5/11/95
Security: Everyone

GeoPort 1.x: System 7.1.x and System Update 3.0 Install (5/95)

=====

Article Created: 11 May 1995

TOPIC -----

This article details the install order for GeoPort software on System 7.1.x with the System Update 3.0.

DISCUSSION -----

There is a conflict between the GeoPort 1.x installer for Power Macintosh and Quadra AV computers with System Update 3.0.

The GeoPort software installer will hang or freeze, usually after clicking the OK button, at the "Welcome to the GeoPort Installer" window. You may get further in the install process and receive an error indicating the installation could not continue, then hang or freeze after clicking the OK button in the error window.

The workaround is to follow the install order below:

- 1) Install System 7.1.x
- 2) Install GeoPort 1.x
- 3) Install the System Update 3.0

The key is to install System Update 3.0 last. If you have a problem installing the GeoPort software, start by doing a clean system software installation, then follow the order shown above.

PCI Expansion Bus Architecture Description (9/95)

Revised: 3/20/96
Security: Everyone

PCI Expansion Bus Architecture Description (9/95)

=====

Article Created: 11 May 1995
Article Reviewed/Updated: 29 September 1995

TOPIC -----

This article contains basic information about Peripheral Component Interconnect (PCI), why Apple is incorporating PCI into its new machines, a comparison of PCI with NuBus, and answers to some commonly asked questions.

DISCUSSION -----

What is PCI?

PCI (Peripheral Component Interconnect) is a high-performance expansion bus architecture that was originally developed by Intel to replace the traditional Industry Standard Architecture (ISA) and Enhanced Industry Standard Architecture (EISA) buses found in many 80x86-based PCs.

To promote its widespread acceptance, Intel turned the specification over to a broad-based committee of industry leaders whose function is to define and market PCI. This committee consists of 12 voting members, 11 of whom are elected on an annual basis, with Intel retaining a permanent voting position. Apple is currently a voting member.

Turning the PCI specification over to a committee opened it up for free licensing and use by any vendor. Vendors have responded with enthusiasm. Currently, more than 200 vendors are producing PCI cards, and more than 500 cards are available for this bus architecture.

Why is Apple moving to PCI?

PCI is a computer industry standard. By moving to PCI, Apple continues to demonstrate its commitment to "fitting in" in the industry. The majority of personal computers based on 80486 or Pentium processors already incorporate the PCI architecture. Apple's adoption of PCI for its new Power Macintosh computers and Workgroup Servers will support and strengthen the specification's status as

a standard in the industry. And, in the future, PowerPC processor-based computers from IBM and Motorola will also use this bus architecture. Apple's full implementation of the PCI 2.0 specification lets any existing PCI 2.0 compliant card work in an Apple computer when combined with a software driver specific to the Mac OS.

Going with an industry standard provides a number of benefits. Because Apple fully implemented the PCI 2.0 specification, in conjunction with a software driver specific to the Mac OS, any existing PCI 2.0-compliant card will work in an Apple computer with PCI. This compatibility gives users of Power Macintosh and Workgroup Server systems with PCI slots access to the many PCI cards available today. It also enlarges the potential market for PCI cards, which should both encourage their future proliferation and drive their cost down further.

In addition, the PCI bus will allow Apple to use more industry-standard components in the future, which will make Power Macintosh computers and Workgroup Servers even more affordable.

PCI provides high performance. PCI offers significantly higher performance than NuBus, the bus architecture used in previous Macintosh models. More specifically, a PCI card can provide performance up to three times faster than that of a similar card on even the fastest computers with NuBus slots.

PCI is a very scalable technology and will offer further performance gains in the future. Plans for extending the bus include support for 64-bit extensions and a higher clock speed across the bus.

PCI on a Power Macintosh or Workgroup Server will provide outstanding performance, made possible because these computers are designed with performance in mind. More specifically, the fact that these systems contain only PCI slots allows Apple to take full advantage of the power of the RISC (Reduced Instruction Set Computing) architecture, enabling all PCI cards to run at the maximum speed of 33 megahertz. In contrast, many 80x86-based PCs offer mixed slots, which run at a range of speeds.

PCI promotes new solutions. PCI will also attract new solutions to the Power Macintosh platform. Developers of specialized cards who found the NuBus market too small or the technical side of developing for NuBus too complex will find it easy to adapt their products for Power Macintosh computers with PCI. Instead of a massive hardware and software effort to move to Macintosh, these developers will be able to take their existing PCI hardware and simply add a Mac OS specific software driver.

PCI and NuBus: A comparison

The following chart/table provides a feature-by-feature comparison between the PCI and NuBus specifications:

Begin_Table

	PCI	NuBus
Bus Speed	33 MHz	10 MHz

Theoretical Maximum Throughput	132 MB per second	40 MB per second
Maximum Number of Slots	4 per bridge; 256 bridges	6 per bridge; 14 bridges
Real Throughput	90 MB per second writes; 45 MB per second reads	32 MB per second writes; 20 MB per second reads
Software	Name Registry, Open Firmware	Slot Manager
Form Factor	12.283 in. and 6.875 in.	12 in. and 7 in.

End_Table

One point that is especially significant is the change in software that the move to PCI represents. All Apple computers with PCI will have built-in Open Firmware software, which is a standard (IEEE 1275) for booting PCI cards in an OS-independent environment. Using Open Firmware gives Apple flexibility in its choice of future operating systems.

Finally, the runtime environment for PCI cards is also being rewritten to allow for growth in the future. The new expansion manager will allow PowerPC and 80x86 drivers to coexist in the PCI cards' ROM. This ability to accommodate multiple drivers permits the performance of I/O activities conducted via cards to improve significantly in the future.

Questions and Answers

Question: Can NuBus cards be used in an Apple computer with PCI slots?

Answer: Yes. To preserve customer investments in NuBus technology, a NuBus expansion chassis for PCI will be available from a third-party. This chassis will enable users to continue to use their existing NuBus cards in Power Macintosh computers and Workgroup Servers with PCI, if they so choose.

However, because PCI offers both higher performance and more solutions, we anticipate that users will embrace the new bus technology. In addition, the built-in graphics acceleration capabilities of the new Power Macintosh computers should allow these systems to meet the needs of many customers without the addition of an acceleration card.

Question: Can any PCI card be used in a Power Macintosh computer or Workgroup Server with PCI?

Answer: Yes. However, a Mac OS-, NetWare-, or AIX-specific software driver is required for each card. Many manufacturers of existing PCI cards have already committed to producing these drivers.

Question: What kind of industry support exists for PCI on the Power Macintosh?

Answer: A number of companies in both the United States and Europe have committed to producing PCI cards for the Power Macintosh. These companies include Apple, Adaptec, Asanté, ATI, ATTO, Data Translations, Diamond Multimedia, DPT, Farallon, FWB, Hermstedt GmbH, Interphase, Matrox, MicroNet, miro, National Instruments, Neutral, Orange Micro, Precision Digital Images, Q-Logic, Rockwell, Second Wave, Spectra Systems, and Yarc.

Question: What PCI cards will Apple provide?

Answer: Apple will provide several PCI networking cards, including the Apple PCI Ethernet 100BaseTX Card, Apple PCI Token Ring Card, Apple PCI Ethernet Twisted-Pair Card, and Apple PCI Ethernet Thin Coax Card.

Question: Will Apple's move to PCI be reflected across its product lines?

Answer: Yes. Apple will offer PCI not only in desktop systems and Workgroup Servers, but also in PowerBook notebook computers.

Power Macintosh: Erase ROM Message (5/95)

Revised: 5/12/95
Security: Everyone

Power Macintosh: Erase ROM Message (5/95)

=====

Article Created: 12 May 19950

TOPIC -----

I have a file called Erase ROMs in the Apple Extras folder. When I double-click it, a dialog box appears with a message, "You are about to initiate a process that will permanently erase your ROMs. Do you want to continue?", and "Go for It" and "Never Mind" buttons with the second button dimmed.

Where is this message coming from?

DISCUSSION -----

Apple shipped a Connectix utility called Connectix Destop Utilities (CDU) with Power Macintosh computers starting in the Fall of 1994. This utility was in the Apple Extras folder. It's purpose was to provide customers with a more robust Energy Star solution. This dialog box is being generated from one of the desktop pattern documents included with CDU.

In order to see this dialog you must:

- 1) Open the CDU folder within Apple Extras folder.
- 2) Open the Sample Desktop Pictures folder.
- 3) Extract the CDU Sample Pictures.sea file.
- 4) Locate the CDU Sample Pictures folder and open it.
- 5) Open the B/W folder.
- 6) Double-click the Erase ROM document.

This "dialog box" is not really a dialog box, but a document on your hard drive which CANNOT erase the ROMs on your computer. Macintosh ROMs cannot be erased by software running on the computer.

At Ease for Workgroups 3.0 Read Me (11/95)

Revised: 11/7/95
Security: Everyone

At Ease for Workgroups 3.0 Read Me (11/95)

=====

Article Created: 11 May 1995
Article Reviewed/Updated: 7 November 1995

TOPIC -----

The following article is the ReadMe file for At Ease for Workgroups 3.0.

... PLEASE NOTE THE INFORMATION ENCLOSED IN BULLETS "•" IS NOT PART OF THE ORIGINAL READ ME FILE BUT HAS BEEN ADDED HERE TO CLARIFY SOME OF THE PROCEDURES DESCRIBED IN THE ORIGINAL READ ME FILE. ...

DISCUSSION -----

This document reflects the latest information on At Ease for Workgroups 3.0. Please read this document carefully. The software may have changed slightly since the manual was printed.

Installing At Ease

=====

You should use the Installer program to install At Ease for Workgroups. Do not attempt to install At Ease by dragging files onto your hard disk. The Installer places the files in the correct locations on the disk.

Before using the At Ease Installer program, make sure you have quit all other application programs. If you have trouble installing, temporarily turn off all extensions by holding down the Shift key while you restart your computer. Then try installing again.

If you install At Ease for Workgroups 3.0 on a computer running system software version 7.0 or 7.1 and you later install version 7.5 on your computer, use the Custom Install option of the At Ease Installer to install the At Ease Guide.

Installing Mouse Practice

=====

Install Mouse Practice immediately after installing At Ease for Workgroups.

Removing At Ease

=====

If you decide to remove At Ease for Workgroups, use the At Ease Installer program. Never attempt to remove At Ease from your System Folder while At Ease is turned on. See the manual for more information on removing At Ease.

Getting Help in At Ease

=====

In addition to the manual and this Read Me file, there are two ways of obtaining online help in At Ease for Workgroups.

Apple Guide (System 7.5 Users)

If you are using system software version 7.5 or later, you can use Apple Guide to get instructions for using At Ease. At Ease Guide, the Apple Guide for the At Ease panels, is available from the Guide menu whenever At Ease is the active application program.

Balloon Help

Balloon Help is available for almost every function of At Ease. To activate Balloon Help, choose Show Balloons from the Guide menu (system software version 7.5) or the Help menu (system software version 7.0 or 7.1). When you are finished using Balloon Help, choose Hide Balloons from the Guide menu or Help menu.

Some Changes From At Ease 2.0

=====

You can now register a maximum of 4000 users in up to 200 setups. (The maximum number of users allowed in a single setup is 1000.) For best performance, however, Apple recommends a limit of 1000 users total and 300 users per setup. For networked setups, performance depends on the speed of your network, the server, and each computer using At Ease.

In previous versions of At Ease for Workgroups, the log sometimes showed successful attempts to open the At Ease Setup program even when no one had tried to open it. This bug has been fixed in version 3.0.

Upgrading From Earlier Versions of At Ease

=====

For most upgrades, your administrator password (if you had one) will remain the same in the At Ease Setup program in At Ease for Workgroups 3.0. When the At Ease Setup program asks for an administrator name, type "At Ease Administrator,"

which is the default administrator name.

Upgrading From Version 1.x

If you are upgrading from At Ease version 1.x to At Ease for Workgroups 3.0, you must first remove the old version by using the At Ease Installer program that came with the old version. When the Installer screen is displayed, hold down the Option key to change the Install button to Remove. Then click Remove to remove the old version.

... The information above is incomplete. The correct procedure to remove At Ease 1.0 is:

Step 1

Double-click the At Ease 1.0 Installer.

Step 2

Click OK to pass the "Welcome to the At Ease Installer".

Step 3

Click on the Customize button.

Step 4

Select At Ease in the window on the left.

Step 5

Hold down the option key to change the Install button to a Remove button. ...

Any items you created in version 1.x are automatically assigned to a setup or user named At Ease 1.0.

Upgrading From Version 2.x

Upgrading from version 2.x to version 3.0 occurs automatically when you first run the At Ease Setup program of version 3.0. At Ease turns itself off at the end of the installation process, so you must run the At Ease Setup program to turn At Ease back on.

If you upgrade from any version of At Ease for Workgroups 2.0, you must run At Ease Setup on each computer to update the preferences files and databases before you can add the computer to the list of updated computers. (If a computer is already in the list, this step is unnecessary.)

... The information above is incomplete. It should state that:

To update At Ease 2.x machines to At Ease 3.0, you must first follow the normal installation process. You should first startup your computer with extensions off by holding down the shift key while starting your Macintosh until it says

"Welcome to Macintosh, Extensions Off". Run the installer program from the installer disk.

After upgrading the first computer to At Ease 3.0, you should be careful not to start any of the 2.x workstations that use the same At Ease server. If this is done, the 2.x workstation will get caught in a loop, displaying an error message that states that the machine should be restarted with an 'OK' button; after clicking on the button, the message re-appears and the only way out of the loop is to physically turn off the computer; force quit does not work.

When updating your workstations, be sure that no one is currently using At Ease from the server. ...

Upgrading From Non-Workgroup (2.x or 3.0) to At Ease for Workgroups 3.0

At Ease creates setups in the new version for each user in the old version; the new setups have the same names as the old users. For example, if you had two users named Billy and Sally in the non-workgroup version, the At Ease Setup program of At Ease for Workgroups will now show two setups (Billy and Sally) and two users (also Billy and Sally). You can rename users and setups.

Installing Other Programs While Running At Ease

=====

You should not install programs onto your hard disk while running At Ease for Workgroups. Before you install programs, turn At Ease off in the At Ease Setup program and restart your computer. When you finish installing programs, turn At Ease back on and restart the computer again. Programs you install onto your hard disk are not automatically added to At Ease setups or users; you must use the At Ease Setup program to provide access to the new programs.

If some program buttons are not displayed properly in At Ease after you install new software, you should rebuild your desktop. To do so, turn At Ease off and restart your computer. While the computer is restarting, hold down the Command and Option keys until you see a message asking whether you want to rebuild the desktop file. Click OK. When the computer has finished starting up, turn At Ease back on in the At Ease Setup program and restart the computer again.

Disk Security

=====

At Ease for Workgroups 3.0 includes an option for locking the startup disk. If you turn on this feature in the At Ease Setup program, do not attempt to update your disk driver, repair the startup disk, or install any other security software onto the startup disk. Doing so may cause you to lose all information on your startup disk. If you need to alter the startup disk in any of these ways, you must first turn off the Lock Startup Volume setting in the At Ease Setup program.

The startup disk security feature in At Ease does not work with some computers

because of disk driver incompatibilities. If the feature is unavailable on your computer, the Lock Startup Volume checkbox is usually dimmed in the At Ease Setup program.

Shared Folder

At Ease for Workgroups 3.0 includes a setting for preventing users of a setup from saving files in the shared folder. However, a user who is allowed to open and save documents anywhere will be able to save to the shared folder even if this setting is selected. To prevent users of a setup from saving to the shared folder, you must also limit their location for opening and saving.

Restricted Finder Users

There are several things you should know about the restricted Finder environment.

Security in the Restricted Finder

In trying to maintain compatibility with other programs, the restricted Finder environment can sometimes allow programs to bypass some of the security features you selected in the At Ease Setup program. If programs you use seem to pose security problems, you may want to remove them from your hard disk.

Security is maintained for restricted Finder users by creating a list of "approved" application programs, desk accessories, and control panels that can be opened by the user. This list includes

- all items in the current setup folder
- items in the Apple Menu Items folder (if you have given access to them)
- the Chooser (if you have given access to it)
- the Print Monitor
- items in the Startup Items folder (only if the setup will open them)
- items in the Shutdown Items folder
- items in the Control Panels folder (if you have given access to them)
- the At Ease Setup program (administrator password required)
- approved sub-launched programs (for more information, see "Sub-Launching Programs" later in this Read Me file)

If a document exists in any of these places, the application that created the document can also be opened.

The At Ease Setup program can always be opened because the administrator password restricts access.

The list of approved programs does not include programs in the user's own documents folder. (If it did, a user could copy a program from a floppy disk to his or her documents folder and attempt to open it without permission.)

Macintosh Guide and the Restricted Finder

Because of changes in the Finder made for restricted Finder users, instructions in Macintosh Guide (available from the Guide menu in system software version 7.5

or later) may not always be accurate. For example, when users who do not have access to control panels use Macintosh Guide to request instructions on adjusting the sound volume, they will not be able to complete the required steps.

Desktop Items and the Restricted Finder

When a user connects to (mounts) a disk other than the startup disk, items on the desktop of the disk are placed in a folder called "Items for Desktop," located at the top level of that disk. When the user disconnects from (unmounts) the disk, the items are not replaced on the desktop.

Copying in the Restricted Finder

If a user drags a folder for which he or she doesn't have access (such as another user's folder) into his or her own folder, the computer will not copy any files from the dragged folder, but it will add an empty folder of the same name to the hierarchy for the user's folder.

File Sharing and the Restricted Finder

File sharing does not work with the restricted Finder. When a restricted Finder user logs in, At Ease turns off file sharing. The next regular Finder user who logs in and wants to use file sharing must return to the Sharing Setup control panel and turn file sharing on again.

Do not use file sharing on computers that will be updated via the Update Computers command in At Ease Setup.

RAM Disks and the Restricted Finder

Do not use RAM disks if any user works in the restricted Finder; doing so may cause your computer to crash.

Sub-Launching Programs

=====

Sub-launching is the process by which one program opens another program (called a subprogram) without the user having directly opened the subprogram. The security features of At Ease can sometimes interfere with a program's ability to sub-launch necessary subprograms. When a program attempts to sub-launch a subprogram to which a user has not been given access, the computer will usually display a -5000 error code.

There are two ways to allow programs to sub-launch the subprograms they need. In either case, the subprogram bypasses the security that At Ease provides.

- In the At Ease Setup program, open the Settings menu and choose Application Preferences. Add the necessary subprograms to the list, and then select each subprogram and click the checkbox labeled "Can be launched by other applications." This setting applies to all users and setups, so you need to follow this procedure only once. You should be aware that this setting allows

all users—including restricted Finder users—to open the subprogram.

- In the At Ease Setup program, give access to all the necessary subprograms. This procedure allows you to specify which users or setups have access to the subprograms. The disadvantage of this procedure, however, is that users see a button for each subprogram even though they normally won't need to open the subprograms directly.

At Ease for Workgroups 3.0 and Kid Pix Studio

=====

Kid Pix Studio sub-launches each subprogram a child uses. But because of a software incompatibility, At Ease does not view these subprograms as application programs. To allow Kid Pix Studio to sub-launch its subprograms successfully, choose Application Preferences from the Settings menu of At Ease Setup and click the Custom button in the screen that appears. In the Custom Add screen, add each of the following subprograms:

Name	File Creator
-----	-----
KPS 0	Kîd0
KPS 1	Kîd1
KPS 2	Kîd2
KPS 3	Kîd3
KPS 4	Kîd4
KPS 5	... Kîd4

This information is incorrect the original Read Me states to type Kîd4 again for the KPS 5 name, it should read Kîd5 ...

To type the î character in the file creator names, hold down the Option key while you type the letter i, then release the Option key and immediately type the letter i again.

For more information on using the Custom Add screen, see "Application Preferences" later in this Read Me file.

At Ease for Workgroups 3.0 and Control Panels

=====

Users who start out in the At Ease panels and switch to the Finder may experience problems when opening control panels. If they choose Control Panels from the Apple menu of the Finder, the Control Panels folder appears as expected. If they choose a particular control panel from the Control Panels submenu, however, they are returned to the At Ease panels. In most cases, the selected control panel appears in front of the At Ease panels. But for certain control panels, such as the Extensions Manager in system software version 7.5, a message appears saying that the selected control panel can't be opened in At Ease.

To avoid these problems, At Ease users who switch to the Finder should not use the Control Panels submenu. Instead, they should choose Control Panels from the Apple menu of the Finder and then double-click the control panel they want in the Control Panels window that appears.

At Ease for Workgroups 3.0 and File Servers

=====

Do not install At Ease for Workgroups 3.0 on an AppleShare server or a computer with file sharing turned on if you plan to use that computer as the At Ease server for your workgroup. If At Ease is installed on that computer, you can't use that computer as a member of the workgroup.

The At Ease Items folder contains important information about your At Ease setups. On most computers, this folder is located inside the System Folder. If you are using an AppleShare server to store your At Ease information, however, the folder is located at the top level of the selected server volume. Do not move or remove the At Ease Items folder; At Ease will not operate correctly if it is missing from the proper location.

You should use the Update At Ease Computers command any time you have changed the primary administrator's password. (Other computers on the network may not recognize the new password unless you update them.) If you use an At Ease server, the new password will be required the next time any user returns to the login screen.

When a user whose documents folder is on a server uses the Command-Shift-3 keystroke sequence to make a screen capture (a "snapshot" of what appears on the screen), the computer may take a minute or longer to save the screen capture in the user's documents folder. During that time, the screen will be frozen and the computer may seem to have crashed.

At Ease for Workgroups 3.0 and CD-ROM Discs

=====

At Ease for Workgroups 3.0 includes a security feature for preventing users from ejecting CD-ROM discs without first entering the administrator password. However, it is possible on many CD-ROM drives to physically eject a CD-ROM disc by pressing an eject button on the drive itself. At Ease cannot prevent users from ejecting CD-ROM discs in this way.

At Ease can display only one CD-ROM panel at a time. If a user inserts another CD-ROM disc to which he or she has access, a message appears indicating that the disc can be accessed using buttons. If the user ejects the first CD-ROM disc, the second CD-ROM disc appears as a panel.

The CD-ROM Preferences feature does not work properly with audio CDs.

At Ease for Workgroups 3.0 and the Find File Feature in System 7.5

=====

While At Ease is running, Find File finds only those items in locations to which the user has complete access, including the user's documents folder and the Trash folder. Most other locations (including server volumes and the user's setup folder) do not return any information when Find File is used.

At Ease for Workgroups 3.0 and the Startup Items Folder in System 7.5

Any item in the Startup Items folder will be opened at startup, even if you didn't give the user access to the item or to the program used to create it. If you don't want all users to have access to an item, don't place the item in the Startup Items folder.

Application Preferences

The Custom button in the Application Preferences screen should be used only when At Ease security settings are interfering with a program's ability to sub-launch other programs that it needs and the "Can be launched by other applications" setting doesn't solve the problem. It is very unlikely that you will need to use the Custom button.

When you click the Custom button, the Custom Add screen appears. You provide a name (which can be anything you like, since it's needed only for display in the list of applications) and the file creator for each subprogram you are having difficulty sub-launching. You must type the file creator exactly, including any spaces and special characters. (You can usually get the name of the file creator from the developer of the software.)

The Custom button also allows you to remove programs from the Application Preferences list—even programs that you added to the list using the Add Other button. To do so, click a program's name in the list and click the Custom button. If the Custom Add screen does not already include a name and file creator for the program, type the program's name (exactly as it appears in the list) and its file creator. Then click Remove.

Importing Users

If your user list is in a format that cannot be read by At Ease, save it as a standard 'TEXT' file. At Ease will then be able to read in the information.

Database Consistency Checking

At Ease for Workgroups 3.0 uses a sophisticated database for handling user information. If a problem is detected, the At Ease Setup program alerts the administrator and asks whether it should verify the database files. When the

verification is complete, a file called Consistency Check Report appears on the startup disk.

The administrator can also manually start the verification process by holding down the Command key while starting the At Ease Setup program.

WS 8150: Getting Started Manual Error (5/95)

Revised: 5/12/95
Security: Everyone

WS 8150: "Getting Started" Manual Error (5/95)

Article Created: 12 May 1995

TOPIC -----

In the Workgroup Server (WS) 8150 "Getting Started" manual on page 15 it states, "it is recommended that you lock the power switch on by turning it to the horizontal position. In the case of power failure, the server will start up automatically. ... When the power switch is locked on, you cannot turn the computer off by choosing Shut Down."

Our WS 8150 does not start up automatically when choosing the Shut Down command from the Special menu with the power switch is locked. Is there something we are doing incorrectly, or is our Workgroup Server's power switch feature, as described in the manual, not really functional?

DISCUSSION -----

Engineering reports that the Power Macintosh 8100 and WS 8150 computers are behaving correctly. The documentation is not correct. If you choose the Shut Down command the computer will shut down, no matter if the power switch is locked on or not. We will inform the documentation department about this error, but we do not know when changes will be made.

At Ease 3.0 For Workgroups: Description & Overview (5/95)

Revised: 8/14/95
Security: Everyone

At Ease 3.0 For Workgroups: Description & Overview (5/95)

=====

Article Created: 12 May 1995
Article Reviewed/Updated: 14 August 1995

TOPIC -----

This article contains a list of usage requirements, descriptions of new features, and service and support information for At Ease 3.0 For Workgroups.

DISCUSSION -----

Overview
=====

At Ease for Workgroups 3.0 is a network security and access management software. At Ease for Workgroups 3.0 is intended to control access to files and applications on shared Macintosh systems in classrooms, university computer labs, and other networked educational environments.

Usage Requirements
=====

At Ease for Workgroups 3.0 requires:

- Macintosh, PowerBook, or Power Macintosh computer
 - 4 MB RAM minimum
 - System 7.0 or later
 - Hard disk
 - Apple SuperDrive 1.4 MB floppy disk drive
- (The At Ease for Workgroups 3.0 installer is available only on High Density disks.)

Workgroups, non-server based At Ease 3.0 requires:

-
- AppleTalk network
 - Sufficient disk space for storage of user's documents

Workgroups, server-based At Ease 3.0 requires:

- AppleShare version 3.0 or later
- AppleTalk network
- Sufficient space for storage of user's documents

New Features

=====

Finder Security

Users can use the standard Finder with its familiar interface without bypassing security limitations set by the administrator.

Middle Level Administration

The main administrator (Superuser) can designate users to be Middle Level Administrators (MLAs). The superuser assigns a limited subset of administrator privileges according to need. For example, the school network administrator can set up a teacher with the ability to change access privileges for their class only.

Better CD-ROM Support

Administrators can more simply allow users access to CD ROMs so that users inserting a CD-ROM will see the CD appear in the At Ease panel or in the At Ease limited Finder. Administrators can also restrict CD access to only designated CD-ROMs.

User Documents Location

Instead of requiring user's documents to be stored on the local hard drive, floppy, or the At Ease server drive, At Ease for Workgroups 3.0 allows the administrator to designate any AppleShare volume in addition to those listed above. For example, an administrator can assign a different document server for each classroom.

Drop Boxes

Each setup can have a drop box designated to it for electronic submission of assignments or other collaborative style efforts.

Shared Folders

Each setup can be assigned a shared folder where administrators can download information for access by all users of groups with access to the shared folder. For example, instead of making several copies of an assignment for each user, the administrator can place an electronic assignment in the shared folder for students to access complete and turn in (possibly in the drop box).

Service and Support
=====

General User

The Apple Assurance Software Support group will support general use customers with questions concerning At Ease for Workgroups 3.0.

Schools

The Apple Assurance K12 support group will support schools with questions concerning At Ease for Workgroups 3.0.

How to Get Support

For more information about how to get support for At Ease for Workgroups 3.0, please reference the Technical Information Library article titled, "Obtaining Apple Product Support in the USA." This article lists 800 numbers and online services available for software updates and Apple support information.

At Ease For Workgroups 3.0: Definitions of Basic Terms (8/95)

Revised: 8/14/95
Security: Everyone

At Ease For Workgroups 3.0: Definitions of Basic Terms (8/95)

=====

Article Created: 12 May 1995
Article Reviewed/Updated: 14 August 1995

TOPIC -----

This article lists the definitions of some basic At Ease For Workgroups 3.0 terminology.

DISCUSSION -----

Workgroups

Takes the basic version and adds network capability to allow schools and other lab-based customers to more easily manage a number of At Ease 3.0 machines. The workgroups version is also more customizable, and allows for many more users and setups.

Setups

In At Ease 3.0 for Workgroups, a setup is a group of users, their files, and other setup specific options. The fundamental grouping of preferences in At Ease is done at the setup level.

Users

This is a person that "logs into" At Ease 3.0 for Workgroups. Usually this means a specific individual, but can also be a group of people who all share the same access to documents. Users can belong to multiple setups. (Note that the basic product redefines setups to users. Thus, a User in the basic product is implemented as a paired combination of a Setup and a User.)

Finder Security

Also known as desktop security, or restricted Finder security, this feature allows for some limited security imposed by At Ease while running the Finder.

Panels

For At Ease 2.0, this was the two large folder-like windows that contained the buttons. In At Ease 3.0 for Workgroups, additional panels are being added for CD-ROM and floppy support.

Panes

Not to be confused with panels, a pane is used in the At Ease Setup for Workgroups application to represent the various palette window states when editing a setup.

Superuser

The primary administrator of At Ease 3.0 for Workgroups. This individual has all rights, including the ability to add Middle Level Administrators.

Middle Level Administrator (MLA)

An individual, assigned to a particular setup, that can handle some routine administration. The actual rights are assigned by the superuser.

AudioVision 14-in. Display: Requires Omni Microphone (10/96)

Revised: 10/11/96
Security: Everyone

AudioVision 14-in. Display: Requires Omni Microphone (10/96)

=====

Article Created: 12 May 1995
Article Reviewed/Updated: 10 October 1996

TOPIC -----

I am trying to get a PlainTalk microphone to work on the AudioVision 14-in. Display. When I connect the PlainTalk microphone to my Power Macintosh 8100, everything works properly. However, when I connect the microphone to the microphone plug on the AudioVision display, the microphone is not recognized. Why?

DISCUSSION -----

There are two different microphones shipping with Macintosh computers: Omni and PlainTalk. They are both require a power or voltage source to operate properly. The power source for these microphones is provided through the microphone connector when you plug the microphone into the connector on the rear panel of the computer.

The PlainTalk microphone that ships with Macintosh AV computers will not work with the AudioVision display because the display connector does not provide the power the microphone needs.

The proper microphone for the AudioVision Display is the Omni microphone. If you want to use a PlainTalk microphone, you must connect to a computer that supports it.

Network Software Installer: System 6.0.x Support (5/95)

Revised: 5/15/95
Security: Everyone

Network Software Installer: System 6.0.x Support (5/95)

=====

Article Created: 15 May 1995

TOPIC -----

What is(are) the proper version(s) of Network Software Installer that I should use to upgrade the networking software on all of my Macintosh computers?

DISCUSSION -----

All Macintosh computers running System 6.0.x should be upgraded with Network Software Installer (NSI) 1.4.5. The most recent release of NSI, Network Software Installer ZM-1.5, is not supported for System 6. This installer works on only System 7 or later Macintosh computers.

All Macintosh computers running System 7.x should be upgraded with NSI ZM-1.5. This is the most recent version of NSI which can only be installed on Macintosh computers running System 7.

System 7.5: Corrupt Fonts Cause Installation problems (5/95)

Revised: 5/15/95
Security: Everyone

System 7.5: Corrupt Fonts Cause Installation problems (5/95)

=====

Article Created: 15 May 1995

TOPIC -----

When installing new printer software on my Macintosh with System 7.5 installed, I get one of the following error messages:

"there is a problem with the disk you are trying to install onto"
"An error occurred while installing onto the active startup disk..."

Why am I getting these messages?

DISCUSSION -----

These error messages can occur if there is an extension conflict, or a corrupt font suitcase. To install your printer software follow these steps:

Step 1

Restart your Macintosh and hold down the shift key. This turns off all your extensions

Step 2

Run the installation program.

Step 3

If you still get the error message, quit the installation, then repeat Step 1, and skip Step 2.

Open your System folder and drag the Fonts folder to your desktop, then repeat Steps 1 and 2. If you still have problems after following these steps, you should call (800) SOS-APPL for additional assistance.

After the installation of the printer software, open the Fonts folder on your desktop and move the suitcases and any PostScript printer fonts you may have installed into the new Font folder inside your System folder.

Macintosh: Erratic Sound & QuickTime movies From CD-ROM (6/95)

Revised: 6/13/95
Security: Everyone

Macintosh: Erratic Sound & QuickTime movies From CD-ROM (6/95)

=====

Article Created: 15 May 1995
Article Reviewed/Updated: 13 June 1995

TOPIC -----

Music CD-ROM discs played from my PowerBook 540 computer sound choppy. The same thing happens if I try to play QuickTime movies from a CD-ROM. When I place these CD-ROMs in another computer, they play fine. Why?

DISCUSSION -----

If playback of QuickTime movies and Audio CDs are choppy, slow, skip, or jump around, check the following:

Step 1

If you have a PowerBook, turn off Processor Cycling (in the PowerBook Control Panel).

Step 2

On all Macintosh and PowerBook computers, turn off Virtual Memory (in the Memory Control Panel).

Step 3

Turn off or quit applications running in the background before you try to play the music or the movie.

How To Remove Global Village Software (5/95)

Revised: 5/15/95
Security: Everyone

How To Remove Global Village Software (5/95)

Article Created: 15 May 1995

TOPIC -----

I recently bought a third-party Fax modem for my Performa. I constantly get the error message, "the serial port is in use," or I can only use my new modem off my printer port. What should I do?

DISCUSSION -----

Your new Fax software is probably conflicting with the original TelePort Bronze or TelePort Gold II software that shipped with your computer. You may want to remove the old TelePort software completely from the computer.

Global Village TelePort Bronze

The software to remove is stored in the following locations:

System Folder: Apple Menu Items: Fax Center
System Folder: Extensions: GlobalFax
System Folder: Control Panels: TelePort/Bronze (may be called Fax Modem)
System Folder: GlobalFax Files
System Folder: GlobalFax Personal

Global Village TelePort Gold II

The software to remove is stored in the following locations:

System Folder: Apple Menu Items: Fax Center
System Folder: Control Panels: TelePort Serial
System Folder: Extensions: Global Village Toolbox
System Folder: Extensions: GlobalFax
System Folder: GlobalFax Files
System Folder: GlobalFax Personal

NOTE: The GlobalFax Files folder contains any Faxes you have sent, you may want

to retain it and the Fax Center folder to later review any messages.

You can move the above files to single folder on your hard disk, and they will be deactivated after you restart your computer. You do not need to throw them away, unless you want to reclaim the disk space. If you do throw them away, be sure you make a backup of the software.

Views Settings Not Remembered Between Restarts (5/95)

Revised: 5/15/95
Security: Everyone

Views Settings Not Remembered Between Restarts (5/95)

=====

Article Created: 15 May 1995

TOPIC -----

My views of folders in windows and the type of information displayed are not retaining their settings between shutdowns (font, snap to grid, size of icons, and so on). I used the Views control panel to change the different views, but my computer does not remember the settings when I restart. What can I do to resolve this?

DISCUSSION -----

Under System 7 and above, these settings are stored in the Finder Preferences file. It is located in the Preferences folder inside the System Folder.

If this file has become damaged or corrupted, you should move it to the Trash so that another one can be created. Once the file has been moved to the Trash, restart your Macintosh computer. A new Finder Preferences file will automatically be created. Empty the Trash after you restart. This should allow your system to remember the settings.

For a complete list of what is stored in the Finder Preferences file, see the Technical Information Library (TIL) article named "System 7: System Preferences and Finder Preferences".

Disabled QuickDraw GX: Generic Fax Sender GX Icon (5/95)

Revised: 5/15/95
Security: Everyone

Disabled QuickDraw GX: Generic Fax Sender GX Icon (5/95)

=====

Article Created: 15 May 1995

TOPIC -----

After disabling QuickDraw GX with Extensions Manager and restarting, the desktop printer icons change to printer icons with an X through them but the Fax Sender GX icon changes to a generic document icon.

If I use ResEdit, I can see that an icon for Fax Sender GX with an X through it does exist, but is not being accessed. Rebuilding the Desktop and trashing Finder Preferences does not fix the generic icon problem.

DISCUSSION -----

The issue you mention was reproduced on a Power Macintosh computer in our lab. At the time of testing this Power Macintosh computer was running System 7.5.1 (System 7.5 plus the System 7.5 Update 1.0) and QuickDraw GX 1.1.1.

This situation has been reported to engineering. It will be fixed in a future version of the Apple Telecom software.

QuickDraw GX users who are using Apple Telecom software 2.0, can avoid this cosmetic bug by doing either of the following:

- 1) Avoid disabling QuickDraw GX while using the Fax Sender GX desktop printer.
- 2) Do not install QuickDraw GX at all. This allows the user to use the non-QuickDraw GX Fax Sender driver.

LaserWriter 16/600 PS: Problem w/ Novell Services on WANs (5/95)

Revised: 5/16/95
Security: Everyone

LaserWriter 16/600 PS: Problem w/ Novell Services on WANs (5/95)

Article Created: 16 May 1995

TOPIC -----

I ran into some problems with the Apple LaserWriter 16/600 PS, corrected by turning off the Novell option in the printer. Here is the problem I had with the LaserWriter 16/600 PS on my Novell WAN (Wide Area Network).

The Novell traffic generated by two LaserWriter 16/600 printers may have been generating as much as 40% or more of our traffic back to our backbone, and our T1 has been "bumping" 100% utilization on occasion, which is unusual for our network. We noticed a dramatic drop in traffic after to turning off the Netware support on these printers.

The captures with a network sniffer show the printers attempting to configure themselves as queue servers for Netware. To do this they attach to each Novell Netware server advertising print services and see if any queues match those on the print server. If they do not succeed they in one pass of all servers they try each again, and again, and again. It looks like the printers poll continually.

Is there a way to change this behavior?

DISCUSSION -----

The IPX implementation on the LaserWriter 16/600 PS has a potential problem on some networks. The problem is a potential degradation of network performance, especially across WAN links, when the Netware mode on the Apple LaserWriter 16/600 PS is enabled (the default) and the Novell server(s) have PSERVER queues.

When the LaserWriter 16/600 PS first starts up and periodically thereafter, it tries to attach to each Novell Netware server that is advertising print services to see if any queues on the server should be serviced by the printer. On a large, multiple server or multiple printer network, these informational packets can consume a large amount of bandwidth. The impact can be greater if the

network is also on a WAN, because the informational packets stretching across slower speed WAN links may have greater impact on those links.

The solution is to use LWPMAN to configure the printer for specific servers that are local to the printer, to prevent unnecessary traffic from being sent everywhere. As a temporary fix, or a secondary fix, you can adjust the queues scan time defaults from within LWPMAN as well (if the queue is scanned less often, less packets are transmitted, but the job remains in the queue, unserved for a longer stretch of time).

TouchWindow: Supported with Early Childhood Connections? (5/95)

Revised: 5/16/95
Security: Everyone

TouchWindow: Supported with Early Childhood Connections? (5/95)

=====

Article Created: 16 May 1995

TOPIC -----

Edmark TouchWindow, which ships with Apple Early Language Connections, locks up when used on a Macintosh LC575 with Early Childhood Connections. Why?

DISCUSSION -----

Using TouchWindow with Early Childhood Connections is not a configuration supported by Apple. There are currently several issues with this configuration:

- Early Childhood Connections ALWAYS locks/hangs when the TouchWindow hardware is connected.
- Early Language Connections (System 7.1) works with the software that ships with the CPU (version 2.1 of TouchWindow) but NOT with the software that might ship with the hardware (TouchWindow 2.00).
- Early Language Connections (System 7.5) works with the hardware connected and the software that comes in the bundle.

Early Childhood Connections does NOT ship with either the software or hardware for TouchWindow.

You can contact Edmark Corporation for additional information about TouchWindow. The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

HyperCard 2.3: Manual Error Wrong Instructions On Pg 137 (5/95)

Revised: 5/16/95
Security: Everyone

HyperCard 2.3: Manual Error Wrong Instructions On Pg 137 (5/95)

=====

Article Created: 16 May 1995

TOPIC -----

This article describes an error in the new "Getting Started" manual for HyperCard 2.3.

DISCUSSION -----

On page 137 of the Getting Started manual for HyperCard 2.3 it says the following:

"You need to change the stack's openStack handler. Replace the line
addColor install with addColor install, 24 or
addColor install with addColor install, 24,
depending on the bit depth you want."

This instruction is telling you to do the same replacement twice.

In reference to the note on page 56, it is obvious that the note on page 137 should say addColor install, 16 or addColor install, 24.

This error in the HyperCard "Getting Started" manual has been forwarded to the HyperCard team for review and revision in future releases.

Easy Install: When This Option Installs Everything (6/95)

Revised: 6/14/95
Security: Everyone

Easy Install: When This Option Installs Everything (6/95)

=====

Article Created: 16 May 1995
Article Reviewed/Updated 14 June 1995

TOPIC -----

Sometimes the Easy Install option in the system software installer installs only those items needed on a particular Macintosh as it is supposed to do. Other times, it does a generic install.

The generic install places items that do not belong or work with the particular Macintosh, such as Powerbook control panels on a desktop CPU. Doing a custom install also does not help. It may do this on one unit, but not on an identical unit, even when using the same installation disks. What is happening?

DISCUSSION -----

When the installer builds a System suitcase it places within it an invisible copy of the installer script. Each successive installer uses the script in the System suitcase. After once doing an install using the "software for any Macintosh" option each successive installer uses that first script as well. This process maintains consistency across numerous installs.

To prevent repeating the generic install, boot from the Disk Tools Disk and remove the System suitcase from the System Folder on the hard drive before running the installer again.

HyperCard 2.3: Installs AppleScript 1.1 not 1.1.1 (5/95)

Revised: 5/16/95
Security: Everyone

HyperCard 2.3: Installs AppleScript 1.1 not 1.1.1 (5/95)

=====

Article Created: 16 May 1995

TOPIC -----

The installer for HyperCard 2.3 says that it will install AppleScript 1.1.1. However, the AppleScript installed on my Macintosh PowerBook Duo 280c by the HyperCard 2.3 installer is version 1.1. Why?

DISCUSSION -----

Apple is aware of this issue. The installer is incorrect in reporting that it will install AppleScript 1.1.1. This has nothing to do with which computer you have or how you ran the HyperCard 2.3 installer. AppleScript 1.1 is the correct version.

Telecom Adapter 2.0 & Calling In To Get Messages (5/95)

=====

Article Created: 16 May 1995

TOPIC -----

When using the Telecom Adaptor 2.0 and not forwarding to the PowerTalk Mailbox, I had a problem with calling in to get messages. What do I need to do?

DISCUSSION -----

There was an omission in the enclosed documentation. While the greeting message is playing press "*" (asterisk) on the phone and you will be asked to enter the password, then press "#" (pound) to continue.

AppleShare Client For Windows 1.0 Read Me (4/97)

Revised: 4/28/97
Security: Everyone

AppleShare Client For Windows 1.0 Read Me (4/97)

=====

Article Created: 16 May 1995
Article Review/Updated: 9 April 1997

TOPIC -----

This article is the AppleShare Client For Windows 1.0 Read Me file.

DISCUSSION -----

This document provides late-breaking news about AppleShare Client for Windows.
It contains the following sections:

- For More Information
- IMPORTANT PRE-INSTALLATION INFORMATION
 - Windows for Workgroups 3.11 and unsupported network adapters
 - Windows 3.1 and 3.11 and unsupported network adapters
- Changing the location of print spool files
 - Viewing Mac OS-formatted files from Windows and DOS applications
- Text-file differences between Mac OS and Windows
- Saving the battery charge on your portable computer
- Supported printer drivers
- Obtaining updated LaserWriter printer drivers
- Useful network utilities
 - Obtaining information about Apple products for DOS and Windows
- Removing the Farallon PhoneNET PC product

For More Information
=====

Refer to the following documentation for more information:

"Getting Started With AppleShare Client for Windows"-This printed manual describes how to install the AppleShare Client application.

AppleShare Client Installer Help - This file describes installing, remove, and

re-installing the AppleShare Client application. AppleShare Client Installer Help is available through the AppleShare Client Installer.

AppleShare Client Help - This file describes the features of the AppleShare Client application and how you use it to share network resources. AppleShare Client Help is available through the AppleShare Client application.

PROBLEMS.WRI - This file describes potential problems you might encounter while installing and using the AppleShare Client application, describes possible causes for those problems and provides suggested solutions to those problems. PROBLEMS.WRI is stored on the AppleShare Client for Windows Disk 1. During installation, it is copied into the C:\APPLE\A_SHARE directory by default.

USERINST.WRI - This file, located on the AppleShare Client for Windows Disk 2, describes how to install the AppleShare Client application. This file is provided to allow the system administrator to modify the installation instructions for site-specific purposes and distribute them to users. During installation, it is copied into the C:\APPLE\A_SHARE directory by default.

IMPORTANT PRE-INSTALLATION INFORMATION

=====

Before installing AppleShare Client for Windows, you should determine whether you are using supported Ethernet network adapter hardware. If your network adapter is not in the following list, you may still be able to use AppleShare Client for Windows. For more information, see the section "Windows for Workgroups 3.11 and Unsupported Network Adapters" or "Windows 3.1 and 3.11 and Unsupported Network Adapters," as appropriate for your version of Windows.

AppleShare Client for Windows supports the following network adapters:

AE2MC	Artisoft AE-2 MCA Ethernet
ANR	Artisoft Noderunner 2000 (NE2000)
ARTAE3	Artisoft LANTastic Ethernet AE-3 (NE2000)
ARTAE2	Artisoft LANTastic Ethernet AE-2 (NE2000)
ASANTENW	Asante NWMLID Ethernet
ASANTEM	Asante 2100 series MCA Ethernet (NE2100)
ASANTE	Asante 2000 series Ethernet (NE2000)
EII	3Com EtherLink II Adapter (3C503)
EII16	3Com EtherLink II/16 Adapter (3C503)
EIII	3Com EtherLink III Adapter (3C5x9, 3C509)
EIIIEISA	3Com EtherLink III (3C5x9, 3C579 EISA)
ELIIIIMC	3Com EtherLink III (3C529 MicroChannel)
EL1616	3Com EtherLink 16 (3C507 in 16 bit slot)
EL168	3Com EtherLink 16 (3C507 in 8 bit slot)
ELMC	3Com EtherLink/MC (3C523 MicroChannel)
EXP16	Intel EtherExpress 16 Ethernet
NE2000	Novell NE2000 or compatible Ethernet
SMC8003	SMC EtherCard PLUS Elite (8Bit)
SMC8013	SMC EtherCard PLUS Elitel6C,& 8216
XIRCOM	Xircom Pocket Ethernet
XIRCOM2	Xircom Pocket Ethernet II

XIRCOM3 Xircom Pocket Ethernet III
XIRCOMC Xircom Creditcard Ethernet

Windows for Workgroups 3.11 and Unsupported Network Adapters

If you are using Windows for Workgroups 3.11, use your Windows for Workgroups installation disks to install your network adapter. Once the network adapter is working in Windows, you can install the AppleShare Client for Windows software using the normal installation procedures.

Windows 3.1 and 3.11 and Unsupported Network Adapters

If you are using Windows 3.11 or Windows 3.1 without Windows networking software, and you have an a vendor-supplied ODI driver for your unsupported network adapter, you may be able to use the procedures in this section to install AppleShare Client for Windows.

WARNING: Installing your system for networking requires that you manually install the network adapter driver and edit your driver configuration file and your DOS startup batch files. Performing these procedures incorrectly can cause your computer to fail.

Before performing the following procedures, you should locate the software and documentation that came with your network adapter. As you perform the procedures, you will need information from the documentation.

- 1) If your network adapter is not already installed, install and test it, following the instructions in your network adapter documentation.
- 2) Restart your computer and run Windows.
- 3) Run the INSTALL.EXE program on the AppleShare Client for Windows Disk 1.
- 4) In the Installation Options dialog box, choose the Standard Installation option and click Continue. The Select Adapter dialog box appears.
- 5) Select the line at the end of the adapter list that reads "[Other] Unlisted Adapter Option," and click OK. The Network Adapter Settings dialog box appears.
- 6) Enter the configuration settings for your network adapter. If possible, select values that match the adapter configuration settings you used in completing step 1 above. If no matching settings are displayed, simply continue with step 7. If you are already running ODI-based networking software, AppleShare Client for Windows Installer will use your existing network adapter configuration settings.
- 7) Complete the AppleShare Client for Windows installation.
- 8) Exit Windows and restart your computer as instructed by the Installer. If your computer was not already running ODI-based networking software, continue with step 11.
- 9) If your computer was already running ODI-based networking software using your

network adapter card, edit the file ATDRIVER.BAT (in the C:\APPLE\A_SHARE directory by default). Remove the word "REM" from the beginning of the last line so that it reads "C:\APPLE\A_SHARE\ODI.EXE".

10) Restart your computer. AppleShare Client for Windows is completely installed and should run when you start Windows. Skip the rest of this procedure.

11) Use DOS to copy the ODI driver and any supporting files for your network adapter to your AppleShare Client for Windows directory. The default directory path is C:\APPLE\A_SHARE.

12) Edit the NET.CFG file in the C:\APPLE\A_SHARE directory. First, replace all strings of four consecutive X characters (that is, XXXX) with the file name of your driver, excluding the .COM extension for the file. Next, change any parameters that do not match your adapter configuration settings. Check the values for the following parameters:

- the interrupt request level, a one- or two-digit number preceded by INT #1
- the I/O port number, a 3-digit value such as 300, preceded by PORT #1
- the direct memory access channel, a value of 1 or 2 preceded by DMA
- the memory access address, a data address value such as D8000, preceded by MEM You should consult your network adapter card documentation to determine if other parameters are required for your system. Finally, save the NET.CFG file.

13) Edit the file ATDRIVER.BAT (in the C:\APPLE\A_SHARE directory by default). First, remove the word "REM" from the beginning of every line. Next, replace the string "XXXX" in the second line of the file with the filename of your network adapter driver. Be sure to include the filename extension.

14) Save the ATDRIVER.BAT file.

15) Restart your computer by turning it off and then on. AppleShare Client for Windows is completely installed and should run when you start Windows. If you experience any problems after completing these instructions, see the file C:\APPLE\A_SHARE\PROBLEMS.WRI.

Changing The Location Of Print Spool Files

=====

You may want to change the location of the spool files used by the AppleShare Client to store PostScript print jobs until they can be sent to the networked LaserWriter printer. For example, you may want to store these files in their own directory or on a disk with more free space. Do not change the spool file location to a floppy disk or to a CD-ROM disc. It is recommended that you do not change the spool file location to a removable cartridge drive or a network drive unless you are certain that it will be available at all times.

To change the location of the spool files, you must edit the [ports] section of the WIN.INI file. There are three spool files, each on its own line, in the form C:\LWx.PRN=. Edit each line to change the pathname of the file. Do not change the filename itself (LWx.PRN). Also be sure to retain the equal sign (=) at the

end of the line. Do not add a colon before the equal sign; it is a special identifier only for ports such as LPT1: and COM1:.

Viewing Mac OS-Formatted Files From Windows and DOS Applications

AppleShare Client for Windows hides Macintosh files that contain resource forks to prevent their being damaged by an incompatible application or operating system. See the section "Macintosh File Formats" in AppleShare Client Help for additional information.

AppleShare Client for Windows can be prevented from marking these files as hidden, thereby allowing access to the portions of these files that Windows applications might be able to use. To prevent hiding these files, add the following lines to the ASHARE.INI file (C:\WINDOWS\ASHARE.INI):

```
[FileRedir]
HIDERESFILES=FALSE
```

WARNING: Changing this value does not change the format of Macintosh files; you should use these files only with great care.

Text File Differences Between Mac OS and Windows

=====

A Mac OS-formatted text file contains a single character to indicate the end of a line of text. Windows text files contain two characters for this purpose. Some Windows-based text-viewing programs like NOTEPAD and WRITE require text files to contain the DOS/Windows two-character ASCII combination (line feed and carriage return) to indicate the end of a line. Consequently, an entire text file created on the Macintosh may appear as a single line of text to such applications.

If a text file that you create under Windows is opened and then saved (even as a text file) by a Mac OS-based application, the file will be formatted for the Mac OS. Many word processing applications can process multiple file formats. Other low-cost file- and text-translation utilities are readily available for converting text files and other types of documents.

Saving The Battery Charge On Your Portable Computer

=====

Most portable computers minimize battery drain by running the hard disk only when necessary. To provide timely printing of your files, the AppleShare Client print spooler checks the disk every five seconds for pending print jobs. This level of disk activity can significantly shorten the battery charge time. If your computer is not printing to a network printer, you may want to disable the print spooling temporarily.

One easy way to disable the print spooler is to disconnect all assigned network printers. To disconnect printers, click the print services button in the main AppleShare Client window, select each printer, and click Disconnect.

Supported Printer Drivers

Useful Network Utilities

=====

The PC Exchange utility from Apple computer allows you to use your Macintosh computer to format floppy disks for PC computers and to store PC-formatted files on your floppy disks and SCSI hard drives. PC Exchange can be purchased at Apple dealers, and it is included for free in the Mac OS System 7.5.

The PC Net Exchange utility associates a PC icon with PC files stored on a Macintosh server. If you have PC Exchange installed, adding PC Net Exchange allows you to specify document-to-application and document-to-icon mapping based on the filename extension. PC Net Exchange can be downloaded for free from the following sources:

- America Online
keyword: applecomputer
- CompuServe
(go aplsup)
- Apple on the Internet

Removing The Farallon PhoneNet PC Product

=====

Farallon PhoneNET PC cannot be used on the same computer with AppleShare Client for Windows. To avoid disabling your existing network services, the AppleShare Client for Windows Installer currently will not run if PhoneNET PC is already installed. If you want to replace PhoneNET PC with AppleShare Client for Windows, you must first remove PhoneNET PC from the system. At the time this Read Me file was written, no commonly available utility is known to successfully remove the entire PhoneNET PC. This section details how to remove the product so that you can install AppleShare Client for Windows. (You must perform steps 2 and 5 at a minimum to install AppleShare Client for Windows successfully.)

IMPORTANT: Before you remove any network software, you should ensure that no important application depend on that software.

The files that you will change or delete are located in four directories:

C:\
C:\PHONENET
C:\WINDOWS
C:\WINDOWS\SYSTEM

To remove the PhoneNET PC product, perform these steps:

1) Back up all PhoneNET PC files and all system files that contain references to them:

- In the directory C:\

CONFIG.SYS
AUTOEXEC.BAT

- In the directory C:\PHONENET

All files. Especially important are the NET.CFG file and the network adapter driver file. You can recognize the driver by the .COM extension of its filename. When you install AppleShare Client for Windows, you will re-install the driver, and you may need to enter the settings for your network adapter card that are contained in the NET.CFG file.

- In the directory C:\WINDOWS

SYSTEM.INI
WIN.INI
PROGMAN.INI
DOSAPP.INI
PHONENET.INI
PHONENET.GRP
TIMBUKTU.BMP
TIMBUKTU.HLP

- In the directory C:\WINDOWS\SYSTEM

ADSP.DLL
PNTPROTO.DLL
PNTDATA.DLL
FPRINT.386
PNTALK.DRV

2) Delete or "remark out" any command lines in the AUTOEXEC.BAT file that reference or call PhoneNET PC batch files. For example, if your system is configured to start PhoneNET PC when your system boots, your AUTOEXEC.BAT probably contains the following command line, which must be deleted:

```
CALL C:\PHONENET.BAT
```

You should delete or remark any command lines calling the following batch files and executables:

AARP.COM
ABOTH.BAT
AFILES.BAT
APRINT.COM
APRNT.BAT
ASHARE.COM
ASP_WS.COM
ATALK.COM
EXTEND.BAT
PNTVDD.EXE

3) Edit the C:\CONFIG.SYS file.

In the command line beginning "LASTDRIVE=" set the drive letter to P.

4) Delete the C:\PHONENET directory and all the files in it. These files are as follows:

3C509.COM
AARP.COM
ABOTH.BAT
AFILES.BAT
ANET.EXE
APRINT.COM
APRNT.BAT
ASHARE.COM
ASP_WS.COM
ATALK.COM
ATNET.DLL
CHOOSER.EXE
CHOOSER.HLP
COMPAT.COM
DA.DTA
DA.EXE
DA.HLP
DESPool.EXE
EXTEND.BAT
LSL.COM
MAKECFG.EXE
MINSES.EXE
NET.CFG
PAP_WS.COM
PHONENET.BAT
PHONENET.WRI
PNSN
PNTVDD.EXE
QIAO.DLL
README.DOC
REDIR.EXE
ROUTE.COM
SETUP.LOG
SPOOL (a subdirectory)
TB2.EXE
TB2RECPB.DLL
TB2TOOLS.DLL
TIMBUKTU.WRI

5) Edit the C:\WINDOWS\SYSTEM.INI file.

In the [boot] section, change "network.drv=pntalk.drv" to "network.drv="

In the [boot.description] section, change "network.drv=PhoneNET PC" to
"network.drv=No Network Installed"

In the [386Enh] section, remove the following lines:

"device=fprint.386"

"PhoneNETMemoryPool=n" (where n is any number)

Remove the entire [fprint] section.

6) Edit the C:\WINDOWS\WIN.INI file.

In the [windows] section, delete the following line:
"load=PNNOTIFY.EXE"

Delete the entire [MacintoshToPC] section
Delete the entire [PCToMacintosh] section

7) Edit the C:\WINDOWS\PROGMAN.INI file.

In the [Groups] section, find the following line:

"Group(n)=C:\WINDOWS\PHONENET.GRP"
Make a note of the group number (n).

In the [Settings] section, edit the line beginning "Order=" to delete the group number (n) that you noted.

In the [Groups] section, delete the Group line:
"Group(n)=C:\WINDOWS\PHONENET.GRP"

8) Edit the C:\WINDOWS\DOSAPP.INI file.

In the [DOS Applications] section, delete all lines that refer to the C:\PHONENET directory. These include the following:

C:\PHONENET\ANET.EXE=1
C:\PHONENET\ASHARE.COM=1 C:\PHONENET\APRINT.COM=1

9) From the C:\WINDOWS directory, delete the following files:

PHONENET.INI
PHONENET.GRP
TIMBUKTU.BMP
TIMBUKTU.HLP

10) From the C:\WINDOWS\SYSTEM directory, delete the following files:

ADSP.DLL
PNTPROTO.DLL
PNTDATA.DLL
FPRINT.386
PNTALK.DRV

Article Change History:

AppleShare Client For Windows Install Troubleshooting (5/95)

Revised: 5/16/95
Security: Everyone

AppleShare Client For Windows Install Troubleshooting (5/95)

=====

Article Created: 16 May 1995

TOPIC -----

This article describes potential problems you might encounter while installing and using AppleShare on your Windows computer. It tells you possible causes of each problem, and suggests steps you can take to resolve the problem.

DISCUSSION -----

Problems Installing AppleShare Client For Windows

=====

The Installer doesn't automatically detect the network adapter card type and settings.

Microsoft Windows versions 3.1 and 3.11, and Windows for Workgroups versions 3.1 and 3.11, do not support self-configuring network adapter cards that provide this information. You must configure your card by installing jumpers or by using a software utility, and you must provide the card settings to applications that require them. Ask your network administrator for this information or see the documentation that came with your network adapter card.

During the installation process one of the following messages appears:

- Your system is configured with an incompatible AppleTalk network driver. You must remove the driver from your system before installing AppleShare. Please check the README.TXT file for information about removing incompatible drivers.

AppleTalk is the set of network protocols or communications rules that AppleShare clients and servers use to communicate with each other. By default, the AppleShare Client for Windows Installer tries to install the version of AppleTalk included in the product. Only one version of AppleTalk can run on a single network adapter card. If the previously installed AppleTalk software is incompatible with AppleShare Client for

Windows, you should cancel the installation process, remove the incompatible version of AppleTalk, and re-install AppleShare Client for Windows. For instructions on how to remove the Farallon PhoneNET version of AppleTalk, see the README.TXT file. The README.TXT file is located in the same directory in which you installed AppleShare Client for Windows (C:\WINDOWS\A_SHARE, by default).

- This product requires Windows to be running in Enhanced Mode.

AppleShare Client for Windows requires Windows 3.1 running on a 386 or greater Intel-compatible computer. Windows on 286 computers runs in standard mode. Enhanced mode is a feature of 386 and greater Intel-compatible computers and is the default mode for Windows, however a WIN /S or WIN /2 command may be forcing your Windows system into standard mode. Check your WIN launch command in your AUTOEXEC.BAT file. If the WIN launch command appears as WIN /S or WIN /2, then the /S or /2 parameter should be removed or the command should be changed to WIN /3 to install and run AppleShare Client for Windows. For information about the WIN /S, WIN /2, and WIN /3 commands, see your Microsoft Windows documentation.

- The Installer cannot be run while virtual DOS boxes are open. Please close all open DOS boxes prior to running the Installer.

If you are running a DOS application or have started a DOS session from within Windows, then the DOS program or session must be closed before installing.

- A message appears, similar to the following:

<a driver name or batch file name>

The preceding reference to an incompatible driver was found in file:

C:\AUTOEXEC.BAT

This message appears if you have PhoneNET Talk installed on your computer. (PhoneNET Talk is version of AppleTalk manufactured by Farallon Computing, Inc., which is incompatible with AppleShare.) The driver or batch file name identified by the error message must be removed from the AUTOEXEC.BAT file before you can install AppleShare Client for Windows.

WARNING: Removal of this drive or batch file name will disable PhoneNET Talk. You should make this modification to the AUTOEXEC.BAT file only if you are sure you (or applications on your computer) no longer need to use PhoneNET Talk.

Problems Starting DOS After You Install AppleShare Client For Windows =====

An error message appears after the following text is displayed:

NetWare Link Support Layer v2.14

<identity of your card driver>

ODI LAP TSR for AppleTalk, Version 1.0, Copyright (c) 1995 Miramar Systems Inc.,
Santa Barbara, CA.

An error message concerning the AppleShare Client software then appears. You have probably installed AppleShare Client for Windows for a network adapter card that is not supported by AppleShare Client for Windows, or the incorrect configuration information for your network adapter card was specified during installation. Make sure your network adapter card is supported by AppleShare. For information about the supported cards, see the Getting Started With AppleShare Client for Windows guide and the README.TXT file. The README.TXT file is located in the same directory in which you installed AppleShare Client for Windows (C:\WINDOWS\A_SHARE, by default). Check your NET.CFG file to ensure that you specified the correct network adapter card type, interrupt request level (IRQ), and memory address. To check your NET.CFG file you can use the DOS EDIT.COM program or the Windows NOTEPAD.EXE program. You may need to consult your network adapter card documentation or your network administrator to obtain the correct information for your card. Make the appropriate changes to the NET.CFG file and restart your computer.

The following error message appears while DOS is starting on your computer:

LSL out of resources.

This message occurs while the NetWare Link Support Layer (LSL) module is loading. If you had ODI-based networking software installed on your computer before you installed AppleShare Client for Windows, it is probable that one of the networks will not load properly when you start your computer. More memory is required by the LSL module. Add the following line to the LINK SUPPORT section of the NET.CFG file:

MAX STACKS 6

If the MAX STACKS statement already exists and its value is 6 or greater, then increase the number by two.

Problems Using Windows After You Install AppleShare Client For Windows

=====

You experience problems using Windows or Windows crashes when you try to start it.

One or more of the following problems may exist:

- The wrong network adapter card was selected during installation. Check which network adapter card you have in your computer, then re-install AppleShare.
- The network adapter card is set for a different interrupt, I/O port, or memory address setting than was selected during the installation process.

Check the proper settings for your network adapter card, then re-install AppleShare.

- Your network cables are damaged or improperly installed. Check for loose connections, damaged connectors, improper cable termination, and damaged cables and fix any of the problems that exist.
- A startup batch file is loading the network adapter card driver twice or with conflicting settings. See your system administrator.
- The NET.CFG or the ATDRIVER.BAT files were improperly modified. For AppleShare Client for Windows to run properly, certain files must be in the right places and entries in batch files must be correct. Use the information provided in the README.TXT file and the installation log (ATINSTAL.LOG). The README.TXT file is located in the same directory in which you installed AppleShare Client for Window (by default, C:\APPLE\A_SHARE) and the installation log file is copied to the top level of your C: drive.
- An incompatible version of AppleTalk is already installed on your computer. AppleShare Client for Windows allows only one version of AppleTalk software to be running on a single network adapter card. The Installer will not install AppleShare Client for Windows if it detects another version of AppleTalk already installed. Problems can occur, however, if an incompatible product is installed after AppleShare Client for Windows is installed. Examples of incompatible products include Farallon's PhoneNET Talk and network software based on PhoneNET Talk such as FileMaker Pro for Windows from Claris. Either remove the incompatible software or AppleShare for Windows.

NOTE: Your incompatible product may have been updated to work with the AppleShare Client for Windows; contact the manufacturer. MacLan Connect users should contact Miramar Systems, Inc. in Santa Barbara for a version of their software that is compatible with AppleShare Client for Windows.

- You have performed a custom installation on a computer with a Token Ring or LocalTalk network adapter card. Token Ring and LocalTalk network adapter cards are not supported by AppleShare for Windows. Use the Installer to remove AppleShare for Windows from your computer. Obtain a network adapter card that is supported, then re-install AppleShare. See Getting Started With AppleShare Client for Windows and the README.TXT file for information about supported network adapter cards. The README.TXT file is located in the same directory in which you installed AppleShare Client for Windows (by default, C:\APPLE\A_SHARE).

Security: Everyone

AppleShare Client for Windows Troubleshooting (11/96)

=====

Article Created: 16 May 1995
Article Review/Updated: 5 November 1996

TOPIC -----

This article describes potential problems you might encounter while using AppleShare on your Windows computer. It tells you possible causes of each problem, and suggests steps you can take to resolve the problem.

DISCUSSION -----

Problems With Other Network Software
=====

NETX.EXE, the NetWare connection utility, does not work with AppleShare Client for Windows.

NETX, and similar network connection utilities, are written for other networks and are specific to their respective networks. These utilities cannot be used for connecting to a server of another type, such as an AppleShare server.

After installing AppleShare Client for Windows on a Windows system with existing networks, access to AppleShare Client for Windows is not available from the File Manager or other Windows network interfaces.

Unfortunately, Windows limits the number of network interfaces that can be integrated into the Windows environment to one for Windows 3.1. In Windows for Workgroups 3.11 you are limited to the Microsoft Network and one other network. If the Microsoft Network is not installed as the default network, then once again you are limited to a single network that may be integrated into Windows. If you are considering using multiple networks within Windows you should consider the lack of support for multiple network interfaces within Windows before installing a new network. When installing AppleShare Client for Windows using a custom install you may retain your current network interfaces while still using AppleShare Client for Windows. However, you will not be able to connect to and disconnect from servers or administer and view file and folder

information from within the Windows File Manager or Network Control Panel. A connection utility has been provided for the AppleShare Client for Windows to allow you to connect to network services if AppleShare Client for Windows is not accessible from the File Manager. The connection utility can be accessed from the Apple Network Services Program group as the AppleShare Client for Windows program item. An example configuration would be Windows 3.1 with NetWare installed as the default network and AppleShare Client for Windows.

An existing network (such as NetWare) is no longer available from the File Manager.

-
- Windows 3.1 allows access through the File Manager and the Network control panel to only one network. Installing AppleShare Client for Windows has assigned that access to the AppleTalk network. When installing AppleShare Client for Windows and you wish to keep your existing network, select keep current network configuration when asked whether to replace the existing network.
 - Windows for Workgroups 3.11 allows access through the File Manager and the network control panel to only one network other than the Microsoft network. Installing AppleShare Client for Windows has assigned that access to the AppleTalk network. When installing AppleShare Client for Windows and you do not wish to remove your existing network select keep current network configuration when asked whether to replace the existing network.

Problems Running AppleShare Client For Windows

=====

The following message appears:

The AppleTalk driver was not loaded. Please reinstall AppleShare.

As this message indicates, the AppleTalk driver is not being loaded properly while Windows is starting up. Without the AppleTalk software, AppleShare Client for Windows will not function properly. One or more of the following situations may be the cause of the problem:

- Your network adapter card is not supported by AppleShare Client for Windows. Determine which card is installed and ensure that it is in the list of supported cards in the Getting Started With AppleShare Client for Windows guide and the README.TXT file. The README.TXT file is located in the same directory in which you installed AppleShare Client for Windows (C:\WINDOWS\A_SHARE, by default).
- Your network adapter card was not configured properly during installation on a Windows 3.1 ODI-based network. Check your NET.CFG file to ensure that you specified the correct network adapter card type, interrupt request level (IRQ), and memory address. To check your NET.CFG file you can use the DOS EDIT.COM program or the Windows NOTEPAD.EXE program. You may need to consult your network adapter card documentation or your network administrator to obtain the correct information for your card.

Re-install AppleShare Client for Windows using the correct configuration information.

- Your network adapter card is damaged or improperly installed. The network adapter card must be properly installed in a slot on the main logic board and connected to the network with the proper cabling and connectors. Consult the documentation that came with your network adapter card for installation instructions. Ensure that the card is seated correctly in its slot, that any required jumpers are set correctly, and that the software configuration is complete and correct. Run any diagnostic provided for the card.
- Your network cables are damaged or improperly installed. Check for loose connections, damaged connectors, improper cable termination, and damaged cables and fix any problems that exist.
- Your computer was not restarted after the AppleShare Client for Windows software was installed. If you are running Windows 3.1, most of the AppleShare Client for Windows software runs within DOS; simply restarting Windows does not restart the underlying DOS operating system. For AppleShare Client for Windows to run, you must restart (reboot) DOS by turning your computer off and back on.
- You have just removed all of the AppleShare Client for Windows software and reinstalled AppleShare Client for Windows on a Windows 3.1 system and you did not restart your computer. Uninstall AppleShare, then restart your computer, then install AppleShare again.
- When Windows 3.1 is starting up, the startup sequence in your AUTOEXEC.BAT file or other startup batch files may be interfering with the loading or configuration of the AppleShare Client for Windows. This can happen with systems using a DOS menu or special execution sequence for different DOS and Windows environments. You can identify whether this is true if during the DOS startup process, the following message does not appear on your computer screen:

NetWare Link Support Layer v2.14

<identity of your network adapter card driver>

ODI LAP TSR for AppleTalk, Version 1.0, Copyright (c) 1995 Miramar Systems Inc., Santa Barbara, CA.

The NetWare Link Support Layer (LSL) module and network adapter card driver are executed from the ATDRIVER.BAT file by the following statement in the AUTOEXEC.BAT file:

```
CALL C:\APPLE\A_SHARE\ATDRIVER.BAT
```

See your system or network administrator, or your DOS documentation, for information on how to modify your AUTOEXEC.BAT file to properly place the ATDRIVER.BAT execution command before your command to launch Windows.

Problems Connecting To A Server

=====

The following message appears:

The AppleTalk stack cannot connect to an ODI or NDIS network driver. Please reinstall AppleShare.

See the section titled "Problems Running AppleShare Client for Windows," earlier in this document.

No zones appear in the AppleShare Client application window.

- Your computer is on a network that is not divided into zones. Ensure that you know the correct location of the server to which you wish to connect.
- Network hardware (such as cables, transceivers, and routers) is malfunctioning. Check with your network administrator.

Only some of the network's zones appear in the AppleShare Client application window.

Network hardware (such as cables, transceivers, and routers) is malfunctioning. See your network administrator.

No servers, or only some servers, appear in the AppleShare Client application window.

- There are no servers available in the currently selected zone. Ask your network administrator where the server you are interested in is located and select that zone in the AppleShare Client application window.
- The servers are shut down. See the network administrators who manage the servers.
- Network hardware (such as cables, transceivers, and routers) is malfunctioning. See your network administrator.

Names of zones and servers appear corrupted.

Mac OS and Windows use different schemes to display extended text characters (characters beyond the standard keyboard characters). Therefore, names of zones and servers may appear corrupted, but this is just how the names are interpreted by Windows. When viewed from a Mac OS client, the names appear normal. If you can't find the servers you need by using the browsing capabilities of AppleShare Client for Windows, ask your network administrator for help. (To avoid this problem, network administrators should use only standard keyboard characters for zone, server, volume, directory (folder), and file names whenever possible.)

Your user name or password is not accepted.

- You have entered your user name or password incorrectly. Check your

typing carefully, especially for your password, which may include uppercase characters or spaces.

- You have entered the wrong user name for that server. You may have different user name/password combinations for different servers.
- You are not a registered user for that server. The server administrator must register your user name and password on each server you want to use.
- Your password has expired. The server administrator can require that you change your password periodically to maintain the security of the server.
- You have been locked out for repeatedly entering the wrong password. This condition can occur if, for example, the caps lock key is pressed on your keyboard.

Problems Using Files And Directories

=====

You receive the following warning:

Warning! You have opened one or more Mac OS-formatted files that are not compatible with your Windows system. See the information about Macintosh file formats in the AppleShare help system.

You have moved, copied, accessed properties, or opened a file that is formatted for use only on the Mac OS. Such files are usually not usable on Windows systems and are hidden by default. See the AppleShare Client for Windows online help topic "Guidelines for Sharing Network Resources" for further details.

A file or several files on the server appear to have a file size of 0, but when viewed on a Macintosh, the file size is larger.

You are viewing a Macintosh specific program or data file. The data and the size of the data are not available to the Windows File Manager. These files are marked as hidden and do not normally appear. The files are visible if you have selected the "View by file type" menu selection and have turned on the hidden/system files preference within the Windows File Manager. To see the actual file size from Windows use the properties item in the File Manager's File menu.

A file or directory on the server does not appear in the File Manager directory window.

- You do not have sufficient access privileges to gain access to that file or directory. See the server administrator.
- You have connected to the server using the wrong user name and password. You can have two or more user name/password combinations with different access privileges. Try your other name/password combinations.
- The file is a Macintosh program or document that may be incompatible with

the Windows File Manager and is hidden by default to prevent accidental damage. See the AppleShare Client for Windows online help topic "Guidelines for Sharing Network Resources" for further details.

- Names of files on the AppleShare server begin with an exclamation point (!). These filenames have been processed to allow them to be displayed by Windows. This condition is normal. See the AppleShare Client Help topic "Guidelines for Sharing Network Resources" for further details.

Your coworkers using Macintosh computers complain that the names and icons of a document has changed.

You have moved or saved a Macintosh file on the server from your Windows computer. The Windows File Manager does not preserve Mac OS file attributes during file operations. Copy the file to your computer, work on it there, and save it to the server under a new name. See the AppleShare Client for Windows online help topic "Guidelines for Sharing Network Resources" for further details.

Macintosh users can't tell what type of application they should use to open one of your files.

AppleShare servers and Macintosh desktop systems running System 7.5 or systems with the PC Exchange control panel installed will map all Windows and DOS files to a generic PC icon for the Macintosh desktop. If the system extension called PC Net Exchange is also installed, then your files will be mapped by their extension to the application icon specified in the PC Exchange control panel. Macintosh users will be able to double-click your mapped documents to automatically open the file with an appropriate application. AppleShare servers and Macintosh desktop systems without PC Exchange or PC Net Exchange will see a blank file icon for all PC files created by an AppleShare Client for Windows. See the AppleShare Client for Windows online help topic "Guidelines for Sharing Network Resources" for further details.

A file's size changes after you copy or move it.

Some Macintosh specific files have data that is not accessible by the Windows File Manager. Using the Windows File Manager or DOS commands to manipulate such files can remove data from the file, making the file smaller.

You can't find a file using the Windows universal naming convention notation (\\Server\directory\file).

This notation is not supported by the AppleShare Client for Windows. You should use the drive letter followed by the path to specify a file using a path name.

You can't find a file using the full path name.

A Windows-compatible filename has not yet been created for the file or one of its enclosing directories. Windows does not support Mac OS file-naming conventions. When you use a server file from your Windows client computer, AppleShare creates and saves a Windows-compatible name for that file. Until that name is created, the File Manager may not be able to find the file. To ensure

that all server files accessible to you have Windows-compatible names, choose Search from the File Manager's File menu, enter *.* in the Search For box, enter the drive letter of the connected server, check the Search All Subdirectories checkbox, and click OK.

Problems Using Print Services

=====

After connecting to a printer, the printer type is always "unavailable."

- If you are printing to an AppleShare print server, the printer type being spooled is not reported by the server. There is no mechanism in AppleShare Client for Windows version 1.0 for identifying the AppleShare print server.
- Printers actively printing a document, missing a paper tray or in a service state (as when opened to replace a toner cartridge) will display a printer status of "busy" and type "unavailable" after the printer has been selected in the AppleShare Client for Windows connection dialog. Before reassigning a printer port, you should check if all previously spooled files have finished printing. The simplest method is to check your printer but you can also check to see if your print files have finished printing by examining your print directory for files named LWx.PRN or LWnn.~0x where x is the number of the port (that is, LW1.PRN and LW08.~01). If some print files have not finished printing, then reassigning a printer will delete the active print file and reassign any additional spooled print files to the new network printer connection. The active print file for port LW1 will be the file LWxx.~01 where xx is the lowest number of all the files following the same naming convention (for example, among the files LW01.~01, LW02.~01, LW03.~01, the file LW01.~01 will be the active file). These files can be deleted manually if necessary or renamed to another printer port by changing the number in the file extension. An example is to rename a spool file LW01.~01 to LW01.~02 to cause the spooled print document to be printed to the printer connected on port LW2.

A document did not print successfully, but the Print Manager or the application print command indicates that it did.

- AppleShare Client for Windows has spooled the document (stored it to disk) while the printer is printing other documents. Storing the document causes the Print Manager to indicate that has finished printing before the AppleShare Client for Windows has completed the printing operation. Wait until printing stops. If the document has still not been printed, try printing it again, then see you network administrator.
- The file to which a document was spooled has been damaged. See your system administrator.
- A supported printer driver has not been installed. Install the driver by following the instructions in the AppleShare Client for Windows online help.

- A supported printer driver has not been associated with an AppleShare spool file. Associate the driver with the spool file by following the instructions in the AppleShare Client for Windows online help.
- No network printer is connected to the LW port to which you are printing. Connect to a network printer by following the instructions in the AppleShare Client for Windows online help. Check your application print setup and examine your C:\ directory. If you are printing to port C:\LW1.PRN and you see a file titled LW1.PRN stored in the C:\ directory and is not renamed after 5 seconds, then it is likely that the port has not been assigned to a network printer.
- Your application is printing to the wrong port. The AppleShare Client for Windows allows applications to print to only the printer ports LW1.PRN, LW2.PRN, and LW3.PRN. These ports represent AppleShare spool files.
- The network printer is busy or turned off. Check from within the connection dialog of AppleShare Client for Windows whether your printer is available on the network. You may have to wait until the printer has finished printing the current document before your document will be printed.
- The Printers control panel "Send Header with Each Job" check box is not selected. The location of this check box depends on the PostScript printer driver you are using. If you are using the Apple LaserWriter IINTX printer driver that comes with Windows, for example, the "Send Header with Each Job" checkbox is located in the Options dialog box. To display the Options dialog box for this printer driver:

- 1) Open the Printers control panel.
- 2) Click the Setup button.
- 3) In the dialog box that appears, click the Options button.

Select the "Send Header with Each Job" checkbox and then print.

- Fonts are not being downloaded to the printer. Selecting the Printers control panel "Print To: Encapsulated Postscript File" option. The file specified must contain the same drive, directory path, and filename as specified for the port (for example, Port C:\LW1.PRN Encapsulated PostScript file C:\LW1.PRN). The location of this check box depends on the PostScript printer driver you are using. If you are using the Apple LaserWriter IINTX printer driver that comes with Windows, for example, the "Print To: Encapsulated Postscript File" checkbox is located in the Options dialog box. To display the Options dialog box for this printer driver:
- 1) Open the Printers control panel.
 - 2) Click the Setup button.

3) In the dialog box that appears, click the Options button.

Select the "Print To: Encapsulated Postscript File" checkbox and then print.

- The DOS print screen command and redirected commands, such as `TYPE file > LPT1`, do not work with printers to which you connected using AppleShare Client for Windows. DOS does not support printing to PostScript printers.
- DOS programs without PostScript drivers cannot print to printers to which you connected using AppleShare Client for Windows. DOS programs running under Windows can print documents to an AppleShare Client for Windows printer by printing to one of the network connected spool files (for example, `C:\LW1.PRN`) with an Apple LaserWriter or compatible PostScript printer driver. The user must be aware that a DOS program cannot print at the same time as a Windows application.
- AppleShare Client for Windows checks the disk at a minimum of once every 5 seconds for new spooled print files. Once detected, spooled files are renamed to unique file names. If a document is printed before a previous spool file could be detected and renamed, then the previous file will be replaced. AppleShare Client for Windows can be made to check every second to help avoid accidental loss of the waiting print file. One second is the smallest allowable interval. To change the interval time, edit the `ASHARE.INI` file in the Windows directory.

Add the following text:

```
[PrintRedir]
```

```
NewJobFileInterval=1
```

This will cause the spool file directory to be checked at least every second for new print jobs.

- The disk does not have enough space to store spool files. See the following troubleshooting item.

When printing a document, you receive the following message:

Insufficient Disk Space

- The disk does not have enough space to store spool files. AppleShare Client for Windows stores a PostScript version of the document in a file (known as a spool file) while the document is being printed. The amount of disk space usually required is roughly equal to the size of the document being printed, but for complex documents or very small documents the overhead for fonts and PostScript information can be as much as 10 times or more the original document size. Verify that enough space is available on the current disk or specify a different disk on which to save spool files. To specify a different disk or directory, open the `WIN.INI` file in the Windows directory using a program like `NOTEPAD`. Search for `LW1.PRN` in the file. You can change the path of the file to

another disk (for example, from C:\LW1.PRN to D:\PRINT\LW1.PRN). Reassign the printer port in the Printers control panel. You must quit and restart Windows for the change to take affect. You cannot spool files to floppy disks and CD-ROM discs. You can spool to removable media and network drives, but the user must take care not to disconnect or remove the disks from the system while printing or prior to printing.

Note: Windows 3.1 has a problem clearing memory when a print job fails while it is spooling to disk. If you are using Windows 3.1 and you have run out of disk space you should exit Windows as soon as possible and delete the print file, as it is probably a partial print file. Then restart Windows and try printing again.

- The Print Manager is being used. There is little advantage to using the Print Manager with AppleShare Client for Windows. The Print Manager stores an additional copy of each document on the disk before passing the file to AppleShare Client for Windows.

Security: Everyone

System 6: File Names Starting w/Period Can Confuse System (5/95)

=====

Article Created: 16 May 1995

TOPIC -----

In my classroom my students are creating folders called ".Sony" (without quotes) on the hard drives of our school's Macintosh computers. According to the book "MacWorld Secrets," doing this will trash the hard drive. Is this true? If so, how can the damage be repaired?

DISCUSSION -----

The ".Sony" folder name only causes a minor problem on systems running System 6 or earlier. It is definitely not a problem with systems running System 7 or higher. Under any circumstance, naming a folder in this way will not "trash" or otherwise corrupt the data on the hard drive.

The cause of the problem is the way the System 6.0.x and earlier file systems dealt with files and drivers. Opening files and opening drivers used the same toolbox routine. The system would look at the name of the "file" and if it began with a period, would send the open call to the Device Manager. If the file name did not begin with a period, the call was passed to the File Manager. Unfortunately, ".Sony" is the name of the floppy driver so trying to open a file with this name will confuse the system.

Naming a folder ".Sony" should not cause a problem on any Macintosh computer, no matter which system software is running, since only the Finder itself "opens" directories and that is not done with the an "Open" call. The Finder simply searches the catalog file for the names of files and folders whose parent ID is equal to the ID of the folder. No files are actually opened.

In my testing with System 6, I created a new file in TeachText and tried to save it with ".Sony" as the file name. The file would be created but TeachText said it could not open the file to save the data. I tried double-clicking the file and TeachText would launch but I still received the error dialog stating the file could not be opened. I could not trash my hard drive as stated in the MacWorld Secrets book. I could not duplicate this problem under System 7 at

all.

At Ease: What To Do After Deleting At Ease Items Folder (8/95)

Article Created: 16 May 1995
Article Reviewed/Updated: 14 August 1995

TOPIC -----

I have a Macintosh Performa computer running At Ease 2.0. I have been instructed to resolve an At Ease problem by either throwing away the At Ease Items folder or by throwing away At Ease Preferences, At Ease Setups, and At Ease Users. I have done this. How should I proceed?

DISCUSSION -----

This assumes you have already followed the instructions given to you. The result at this point is that you have a "fresh" At Ease, with no users. You now need to re-create those users.

Before doing so, you need to recover information (files) belonging to the previous users.

User Application Access Information

At Ease stores information in a variety of places. In the System Folder, the At Ease Items folder contains a folder called At Ease Setups. This contains the "application" side of your users' set-ups. For example, if one of your users is "John", and John has access to ClarisWorks and Quicken, aliases for these two applications are in a folder named "John" within At Ease Setups. Aliases are just pointers to the original items and are completely disposable. In other words, if you throw the aliases away, you will not be throwing away or in any way damaging the actual applications.

User Personal File Storage Folder

The files that John has created are in a different folder, which is also called "John". This folder is elsewhere on your system. If you have a Macintosh Performa computer, this folder is in the Documents folder. The files John created could include things such as homework assignments, correspondence,

Quicken ledgers, and so on.

Recreating At Ease User Information

You need to be careful as to what you do with this data, both to ensure that the data is not lost, and that when you reconfigure At Ease, the user has access to the data again. The "John" folder containing all the original data is intact, which is exactly what we want.

When you open the At Ease Setup application to recreate "John", you will see an error message, because the "John" folder is still in your Documents folder. It will not let you re-use that name until something is changed about the "John" folder. Something must be done about that "John" folder, but you do not want to throw it away, since it contains original data.

Rename The User's Data Folder

The solution is to rename the "John" folder to something else, such as "John-Backup".

Step 1

Locate the folder, which, again, is in the Documents folder.

Step 2

Click once on the name. The name should highlight (white rectangle around it). If it does not, try pressing the Return key once. Just tap it. This should highlight it. Once highlighted, whatever you type replaces what is there. Type "John-Backup".

Step 3

Next, go back to At Ease Setup, and re-create "John". Add all necessary applications and otherwise configure it according to your tastes.

Step 4

When finished, quit At Ease Setup.

Step 5

Restart the computer. A new folder called "John" is created; there is nothing in it.

Step 6

If you are not already in the Finder (a way to tell if you are in the Finder is that the Trash can is visible), select "Go to Finder" from the Special menu.

Step 7

If you look inside your Documents folder, you will notice there is a new "John" folder.

Step 8

Open the "John-Backup" folder. Move the files that are inside the "John-Backup" folder to the "John" folder.

Step 9

Throw away the "John-Backup" folder.

Step 10

Restart your computer.

Step 11

Open the "John" folder in the Documents folder. You should now see all of John's original documents.

Apple Menu Options 1.0.2: What It Fixes & How To Install (8/95)

Revised: 8/1/95
Security: Everyone

Apple Menu Options 1.0.2: What It Fixes & How To Install (8/95)

Article Created: 16 May 1995
Article Reviewed/Updated: 01 August 1995

TOPIC -----

I just downloaded the Apple Menu Options (AMO) control panel version 1.0.2. Can I get more details on what this fixes? Also, how do I install this new version?

DISCUSSION -----

Problems That Have Been Fixed

There are three problems that were fixed in AMO 1.0.2:

Throwing Away Locked Aliases

If you locked aliases inside the "recent" folders, AMO could hang when trying to delete locked aliases. Now it ignores them if they are locked.

Throwing Away AMO Prefs File

If you dragged the "Apple Menu Options Prefs" file to the trash, AMO could hang. The prefs file can now be safely trashed.

Disappearing Menus

When installed with System 7.5 or System 7.5 with the System 7.5 Update 1.0 (7.5.1), this update to Apple Menu Options (1.0.2) provides enhancements for menu problems encountered by some Macintosh computer users.

System 7.5 or System 7.5.1 must be installed on your Macintosh computer before Apple Menu Options 1.0.2 can be installed.

The problem reported in earlier versions involved left-most application menus disappearing. The menus could disappear under two scenarios:

- The first is by clicking in the menu bar before the application has finished loading.
- The second is by clicking in a part of the menu bar that does not have any menus. This problem has been corrected in Apple Menu Options 1.0.2.

Installation Steps:

=====

Step 1

Drag the Apple Menu Options (1.0.2) control panel onto your closed System Folder.

Step 2

Your Macintosh will ask in a dialog box if it can place the control panel into the Control Panels folder. Select the OK button.

Step 3

If you have an earlier version of Apple Menu Options, you will be asked if you want to replace it. Select the OK button.

Step 4

Restart your Macintosh computer. Once the control panel has been copied to your System Folder, you must restart for changes (fixes) to take effect.

System 7.x: Black Tab on Folder Icons (5/95)

Revised: 5/31/95
Security: Everyone

System 7.x: Black Tab on Folder Icons (5/95)

=====

Article Created: 16 May 1995
Article Reviewed/Updated: 31 May 1995

TOPIC -----

Why is there a black tab on some folder icons under System 7 and later?

DISCUSSION -----

The black tab on a normal folder icon indicates that file sharing is enabled for that folder. If you turn off file sharing on the folder, the tab color returns to normal.

Note that you cannot see the black tab on the shared folders when you are in the View by Smallest Icon Finder mode. Change to View by Icon to see the black tabs.

Native, Conventional, & Fat Applications: Description (6/95)

=====

Article Created: 16 May 1995
Article Reviewed/Updated: 14 June 1995

TOPIC -----

This article clarifies the terminology used in referring to Power Macintosh-compatible applications.

DISCUSSION -----

The Power Macintosh can run two kinds of compatible software:

- Native
- Conventional

Native Applications

Native software is software written for specifically the PowerPC chip; it only runs on a computer that has a PowerPC chip on its logic board.

Conventional Applications

On Power Macintosh computers, conventional software is software written for Macintosh computers that have a 68000, 68020, 68030, or 68040 chip on their logic boards. Conventional software is sometimes referred to as "68K" software. It runs on Macintosh computers that have either a 680xx chip or a PowerPC chip.

Emulation Mode

Conventional software runs in an "emulation" mode, which is functionally similar to the 68020 processor. The main differences between the 68020 processor and later processors (68030 and 68040) are:

- It does not have a PMMU (Paged Memory Management Unit)

This point is necessary because the PowerPC has a newer, better,

memory management model.

- It does not support the SWAP16 instruction

This point is addressed by improvements in the PowerPC chip.

- It does not support a floating point unit

This point requires different steps to work around; such as software emulation of an FPU, or, more commonly, software floating-point routines.

Even though the speed of emulation mode is compared to the speed of a Macintosh with a 68020 processor, conventional software generally runs faster in emulation mode than a Macintosh with a 68020 chip. The performance depends on how many references the software can make to native routines in the computer's software "toolbox". The more native routines that are performed; the faster the software runs.

"Fat" Applications

As new software is written, you will find references to "fat" applications. These are programs that can be run on either a 68K or Power Macintosh computers without modification. The operating system automatically determines which part to use.

Since "Fat" applications are really two programs in one, many installers offer either a "Power Macintosh" or "Conventional" installation. If you have installed a software application that claims to be "Accelerated for Power Macintosh", and it does not recognize features that definitely exist (such as an FPU), make sure you have installed the correct version.

Both versions run on the Power Macintosh, but only the "native" version benefits from all the special features of the Power Macintosh.

System SW Clean Restore:Macintosh Performa Computers w/CD (7/96)

Revised: 12/20/96
Security: Everyone

System SW Clean Restore:Macintosh Performa Computers w/CD (7/96)

Article Created: 16 May 1995
Article Reviewed/Updated: 2 July 1996

TOPIC -----

This article describes the procedure for a Clean Restore (Install) for CD-ROM based Macintosh Performa computers including the: Macintosh Performa 500, 630, 5200, 6100, or 6200 series.

DISCUSSION -----

You may wish to perform a "clean install" when normal extensions troubleshooting fails or when the troubleshooting process becomes too complex.

The process essentially allows you to "start over" with a new System Folder. You will not lose any data, but any software or fonts or configuration information which was stored in the old System Folder will become inactive.

This clean install procedure provides you with a stable foundation from which you can proceed to troubleshoot an abnormal situation.

A regular system software installation modifies and updates the existing System Folder. A clean installation disables the existing System Folder, leaving most files in place, and forces the restoration software to create a new System Folder.

A clean system installation brings the system software back to the standard configuration. This is necessary when system software has been damaged or modified, preventing a normal installation. It is also useful in troubleshooting.

Restart From the Apple Performa CD

Step 1

Start your computer and insert the Macintosh Performa CD. Once the system has finished starting up, "shut down" or turn off the computer. If the computer

does not start completely, do not worry. We mainly wish to make sure the CD is in place.

Step 2

Next, make sure your Caps Lock key is in the UP position, so that the Caps Lock function is turned off. If you have an AppleDesign Keyboard, the position of this key does not matter.

Start the computer, then immediately hold down the Option, Apple (Command), Shift, and Delete keys. Hold them down until you see "Welcome to Macintosh."

The desktop pattern will change. This is normal, and is a consequence of having started the system with a different startup volume. In this case, we are starting from the Macintosh Performa CD.

When the system finishes starting up, you will see a different Launcher at the bottom of the screen.

If you do not see your hard disk icon (normally called "Hard Disk"), try the above procedure again, this time releasing the Option, Apple, Shift and Delete keys sooner than you did before. If you still do not see the hard disk, try the above, but this time holding down the "c" key (lower-case "C") instead of Option, Apple, Shift, and Delete.

If you cannot start with the CD-ROM (that is, you do not see your Performa CD icon on the top right hand side of the screen, above the hard disk; and you do not a different Launcher window at the bottom of the screen), do not proceed. Call 800-SOS-APPL for further assistance.

Run Disk First Aid

Disk First Aid can detect and repair problems with a hard disk's directory structure. Before proceeding with further troubleshooting, it is important to verify that the underlying directory structure is functioning satisfactorily.

Step 1

Click once on the Disk First Aid icon in the Launcher.

Step 2

When Disk First Aid opens, click on the hard disk icon within the Disk First Aid window. Click on the Verify button.

Step 3

If the system finds a problem, click on the Repair button.

If you receive a note stating that Disk First Aid cannot repair the hard disk, you should back up any irreplaceable data or application software on the hard disk and re-initialize it using the appropriate formatting utility for that drive. For Apple drives, use Apple HD SC Setup, which is also in the Launcher. If you have a Performa 580 or a Performa 630 or 5200 series computer, use Internal Drive Format.

Step 4

Select "Quit" from the File menu.

Update Hard Disk Driver

You should update the drivers with the version of Apple HD SC Setup that is on the Performa CD, following these steps:

Note:

If you have a Performa 580 or a Performa 630, 5200, or 6200 series computer, ignore this step. Because you have an IDE drive instead of a SCSI drive, you do not have any drivers to update.

Step 1

Click on the HD SC Setup icon in the Launcher.

Step 2

Click on the Update button. If the Update button is not hilited, or you see a message that "Drive Selection Failed," you should verify whether your hard disk has been reformatted with a third-party driver or uses driver-level compression or security software.

Step 3

When you are finished, click Quit to return to the desktop.

Step 4

Select "Restart" from your Special menu. If the CD fails to eject, right after you hear the startup chime, press the Eject button to remove the CD.

Check Available Hard Disk Space

Be sure you have at least 25MB available on the hard disk where you plan to install the system software. If there's less than 25MB available, you'll need to identify and delete some unnecessary files by moving them to the Trash.

Make sure you do not delete anything you do not have a back-up for. If necessary, copy the files onto individual diskettes or other media before moving them to the Trash.

You can identify the amount of hard disk space available by double-clicking on your hard disk icon on the right hand side of the screen. At the top of the hard disk window, you should see a legend which indicates how much space is available. If you do not, select "by Icon" from your View menu.

Once you identify and remove redundant items, choose Empty Trash from the Special menu, and you'll have more disk space available.

Disable the System Folder

You disable the System Folder by moving the Finder and renaming the System Folder to something else.

Step 1

Open your hard disk's icon and locate the System Folder.

Step 2

Open the System Folder and locate the Finder.

Step 3

Move the Finder to the Trash. (If you get an error message saying that items cannot be moved to the desktop because it is locked, try again: you probably missed the Trash. This time be sure that the cursor (arrow) is on top of the Trashcan and that the Trashcan turns black before you release the mouse button. The Trash should get fat.)

Step 4

Move your System suitcase (the icon with a small suitcase) to the Preferences folder. We keep the System suitcase in case there are sounds inside it you may wish to recover later on.

Step 5

Close the System Folder's window and rename the System Folder to "Storage." Do this by first clicking on the closed System Folder icon, then pressing the Return key. This should hilite the words "System Folder," surrounding them with a white rectangle. Whatever you type will replace what is there. You can also hilite "System Folder" by clicking ONCE in the middle of those words, then waiting for the words to hilite.

Step 6

Close any open windows on your desktop.

Restart Your Computer

Choose Restart from the Special menu. Right after you hear the startup chime, if the CD has not automatically ejected, press the eject button, if you have one. After a few seconds you should see a picture of a disk with a flashing question mark.

If your Macintosh starts up from the hard drive, you have an extra System Folder on the hard disk. You need to locate it (use the "Find" option from the File menu in the Finder) and delete it or disable it as described in the previous section, then restart.

When you get the disk with the flashing question mark on your screen, you can continue.

Restoring The System

Step 1

When you see the disk with a flashing question mark, insert the Performa CD. The computer should start up with the system software on the CD. If the system doesn't start up, turn off the computer, then use the Option-Apple-Shift-Delete method, described above.

Step 2

Locate the "Restore System Software" and "Restore All Software" icons in the

Launcher.

"Restore System Software" restores ONLY the Apple software which was bundled with the computer. This will build a new System Folder, but it will not have any third-party software in it, nor will it have any third-party Launcher aliases.

"Restore All Software" restores ALL software. It will not delete anything: but it will end up creating a brand new System Folder, which will include all bundled Launcher aliases and bundled third-party software. This is ordinarily the option you wish to select.

Step 3

Click on the appropriate "Restore" icon.

Step 4

Click the Continue button, or press the Return key on your keyboard.

Step 5

Respond to any messages you see on the screen.

Step 6

When the system is finished, click the Restart button or press the Return key on your keyboard. You will have then successfully restored your files.

If the CD-ROM does not automatically eject, you will need to press the eject button on the CD-ROM drive right after you hear the startup chime.

Step 7

Select Empty Trash. The old Finder will be in there.

Verify Problem Resolution

After performing a clean installation, verify that you resolved the problem before adding anything to the new System Folder. Adding items to the System Folder before resolving your problem defeats the purpose of the clean restore procedure. You may wish to use your computer for a few days before re-introducing any other extensions or fonts.

Install Non-Standard Items

You can now reinstall the non-standard items from the old System Folder (now named "Storage") such as fonts, screen savers, device drivers, and so on. If at all possible, we strongly recommend that you reinstall these items from their original disks, just in case one of the items had become corrupted and contributed to the problem.

If the original disks aren't available, you may move the non-standard items from the Storage folder to the equivalent place in the new System Folder. Be careful not to replace anything that's already in the new System Folder. Only move items that aren't already in the new System Folder.

Step 1

Open each corresponding folder within the System Folder and the Storage folder

and then compare the contents.

Step 2

Move an item that isn't already in the new System Folder and its subfolders from the Storage folder and its subfolders.

Step 3

Restart your Macintosh.

It is recommended you proceed slowly when doing this. This is part of the troubleshooting process, so you do not want to move everything back at once: instead, move a few at a time, restart, and test to make sure the original problem has gone away.

If you move the items back and the problem should recur, you probably have an extensions conflict. Done properly, you will know which set of extensions cause the problem, but sometimes intermittent extensions conflicts will require more troubleshooting.

Final Steps

Verify that your applications are performing normally. If not, refer to the application manual or contact the vendor.

We normally recommend you keep the Storage folder around for a couple of months, or until you're **completely** certain that you do not need any files from it.

When the Macintosh behaves as expected, move the Storage folder to the Trash, and choose Empty Trash from the Special menu.

This article is one of many available through the Apple Fax center. A/UX 2.0.1 Hard Disk: Making A Copy (5/95)

Revised: 5/16/95
Security: Everyone

A/UX 2.0.1 Hard Disk: Making A Copy (5/95)

=====

Article Created: 16 May 1995

TOPIC -----

I purchased A/UX 2.0.1 a long time ago, on hard disk only. Now I need to transfer A/UX from one hard drive directly to another. I'm also using third party formatting software on the new disk, and my vendor believes the software should work with A/UX 2.0.

Mounting a new disk and copying the files sounds relatively straight forward, but creating the device drivers is something I don't understand. I have some experiences that leads me to believe that I can't simply copy the /dev directory, although most of the rest of A/UX is easily movable.

How do I do this?

DISCUSSION -----

A/UX 2.0 is basically the same as A/UX 3.x. The main change is the version of the Macintosh System Software used in the Mac environment.

The following sequence of commands will create a duplicate of the directory structure of the source drive onto the target drive.

While logged in as root, follow these steps:

Step 1

Mount the drive you want to copy to (target) on /mnt

mount /dev/dsk/c5d0s0 /mnt (Replace SCSI ID and partition as appropriate)

Step 2

Go to the "/" directory, perform the copy, create the mnt directory in /mnt

```
cd /  
find . -print | grep -v /mnt | | grep -v /lost+found | cpio -pdlmuv /mnt  
mkdir /mnt/mnt  
chmod 777 /mnt
```

Step 3

When the copy is finished, unmount the target disk and perform an fsck

```
umount /mnt  
fsck /dev/dsk/c5d0s0
```

Now you have a copy of the source drive, complete with the /dev directory.

File Sharing: Cannot Share Drive With A Shared Folder (6/95)

Revised: 6/13/95
Security: Everyone

File Sharing: Cannot Share Drive With A Shared Folder (6/95)

Article Created: 16 May 1995
Article Reviewed/Updated: 13 June 1995

TOPIC -----

I am trying to start file sharing, but when I select the drive to share an error message, "Cannot share selected drive because there is a shared folder contained within it." appears

How can I find the shared folder without physically checking each folder, is there a sort shortcut?

DISCUSSION -----

You must first turn off file sharing for all shared folders before you can turn file sharing on for an entire drive.

Try these steps to identify which folders have been shared on your hard drive:

Step 1
Select Control Panels from the Apple menu.

Step 2
Double-click the File Sharing Monitor control panel. In a box on the left side of this window is a names list of all shared items.

Step 3
Select the Find command from the File menu. Type in the name of one of the shared items and click the Find button.

- System Software 7.0 to 7.1.2 finds and highlights an item with that name.
- For System Software 7.5 or later, the Find File application presents a hit list of items found. Click the item with the name you are looking for.

Step 4
Select the Sharing... command from the File menu. The Sharing window for that

item appears on the screen.

Step 5

If this item is shared, the Share this item and its contents check box is selected. Click on this check box to deselect it.

Step 6

If the Share this item... check box is not selected, close the Sharing window and select the Find Again command from the File menu in System 7.0 to 7.1.2, or click another item in the hit list in System 7.5. Repeat steps 4, 5, and 6 until you identify the shared item and it is no longer being shared.

Step 7

Repeat steps 2 through 6 until all shared items are no longer being shared. When no items are being shared, the Shared Items list in the File Sharing Monitor should be empty.

You may now share your hard drive. You may still assign different file sharing permissions (for different users or groups) to folders on the shared drive.

Macintosh Apple Desktop Bus Device ID Numbers (5/95)

Revised: 5/17/95
Security: Everyone

Macintosh Apple Desktop Bus Device ID Numbers (5/95)

=====

Article Created:17 May 1995

TOPIC -----

I just got a new keyboard and trackball for my Macintosh computer. These devices came with installation software. I am supposed to enter the Apple Desktop Bus (ADB) device ID number for my keyboard and mouse, but I cannot find this information anywhere in the User's Guide that came with my Macintosh computer. What are the ADB ID numbers?

DISCUSSION -----

Some third party vendors of ADB devices use software that ask the user for the ADB ID numbers of the keyboard and mouse.

Keyboard

On all Macintosh computers the primary keyboard (including built in keyboards for PowerBooks) is ADB device 2.

Pointing Device

The primary pointing device (whether it is a mouse, a trackball, or a trackpad) is ADB device 3.

AWS95 & A/UX: Disk/Disk or Directory/Directory Copy (9/95)

Revised: 9/26/95
Security: Everyone

AWS95 & A/UX: Disk/Disk or Directory/Directory Copy (9/95)

Article Created: 17 May 1995
Article Reviewed/Updated: 26 September 1995

TOPIC -----

I want to copy all the files in the root (/) partition from one disk to another because I'm running out of disk space. Is there a way to accomplish this without loosing access privileges and without having to recreate the /dev directory.

DISCUSSION -----

The following sequence of commands will create a duplicate of the directory structure of the source drive onto the target drive. The same basic command sequence can be used to copy a directory tree from one directory to another.

To Copy The Complete Contents Of A Partition

While logged in as root

Step 1

Mount the partition you want to copy to (target) on /mnt:

mount /dev/dsk/c5d0s0 /mnt (Replace SCSI ID and partition as appropriate)

Step 2

Go to the / directory:

cd /

Step 3

Perform the copy preventing the copy from becoming recursive and without

overwriting the lost+found directory in the target partition:

```
find . -print | grep -v /mnt | grep -v /lost+found | cpio -pdlmuv /mnt
```

Step 4

Create the mnt directory in /mnt:

```
mkdir /mnt/mnt
chmod 777 /mnt
```

Step 5

Unmount the target disk and perform an fsck:

```
umount /mnt
fsck /dev/dsk/c5d0s0
```

Now you have a copy of the source drive, complete with the /dev directory.

To Create A Duplicate Copy Of A Directory Structure

=====

Step 1

Go to the directory containing the source directory to be copied:

```
cd /a_directory
```

Step 2

Perform the copy of the source_dir to the directory where you want the source_dir structure to be move to:

```
find source_dir -print | cpio -pdlmuv /target_dir
```

This results in a directory called source_dir inside of target_dir.

MacX Clipboard and Interleaf Clipboard (7/95)

Revised: 7/20/95
Security: Everyone

MacX Clipboard and Interleaf Clipboard (7/95)

Article Created: 17 May 1995
Article Reviewed/Updated: 20 July 1995

TOPIC -----

I'm having a problem with operations that involve the Interleaf clipboard, which also then involves the MacX clipboard. As a result, I'm losing all but the plain text from the Interleaf clipboard. I have a Power Macintosh, System 7.5, MacX 1.2, and 24 MB of RAM, along with Interleaf 6.0.3 (DTP program) client running on a SPARCstation server 1000 with Solaris 2.3.

Have you heard of this type of problem before? Is there a way to disable the Mac/X clipboard?

DISCUSSION -----

One obvious symptom here is that only text and not graphics is being copied to the clipboard. This has to do with how the X client implements the cut/copy/paste mechanism. The problem is most likely due to a conflict between the X11R4 xclipboard (used by the X client) and the Macintosh Clipboard (used by MacX). This conflict was reported in the MacX 1.1.7 Release Notes:

"Conflicts between xclipboard and the Macintosh Clipboard:

MacX uses the built-in Macintosh Clipboard when you cut and paste text. If you run the xclipboard client application with MacX, it conflicts with the Macintosh Clipboard. To avoid this problem, do not use xclipboard while running MacX. (In other words, do not open the xclipboard client application)."

If this is the case, we suggest that the X client modify their client's xclipboard code to support Macintosh clipboard for copy and paste.

Also regarding the MacX cut/copy/paste Mechanism:

"MacX uses the CLIPBOARD selection. Whenever someone gets ownership of the CLIPBOARD selection, MacX asks that it be converted to STRING and puts the

result into the Macintosh scrap (clipboard). If your application does select things with this selection, it will work.

MacX supports both the old fashioned and modern style of clipboard selection. However, for X clients to work with MacX, they need to use the 'CLIPBOARD Selection' instead of selecting XA_PRIMARY."

Apple Macintosh CD v2.0: QuickDraw GX Disk Image Issue (5/95)

Revised: 5/17/95
Security: Everyone

Apple Macintosh CD v2.0: QuickDraw GX Disk Image Issue (5/95)

=====

Article Created: 17 May 1995

TOPIC -----

I want to make disk images of the QuickDraw GX installer from the Apple Macintosh CD v2.0 that came with my Power Macintosh 7100/80AV, but these disk images seem to be missing.

DISCUSSION -----

There is a problem with the QuickDraw GX disk images on the Apple Macintosh CD v2.0. This has been reported and will be resolved in the future.

In the interim, you can install QuickDraw GX or PowerTalk from the CD by using the System Software Install (look in the System Software Install folder) or Apple Extras (look in the Apple Extras folder) included with the Power Macintosh 7100/80. However, from the disk images on the CD, only PowerTalk will be usable for installation.

System 7.5: Defaults for Labels Control Panel Colors (7/95)

Article Created: 17 May 1995
Article Reviewed/Updated: 19 July 1995

TOPIC -----

I am using system 7.5. How can I reset the colors of my Labels settings to the original defaults?

DISCUSSION -----

To reset the colors, you have to either remove the existing System file and reinstall System 7.5, or you can manually reset the color values. To manually reset the color values, follow these steps:

Step 1

Open the Labels control panel. Each label has a color box on the left and the name on the right.

Step 2

Click on the color box to open the "color picker."

The Color Picker is slightly different from the one used in System 7. The newer version uses Hue Angle, Saturation, and Lightness settings in the default position. Selecting "more Choices" lets you select Apple HSL or Apple RGB Color Monitor options. Either one can be used to reset the colors.

NOTE: System 7.1 used Hue, Saturation, and Brightness which had different values. See related article, "System 7: Defaults for Labels Control Panel Colors" for more information.

Color for "Essential"

Slow Start Up: LocalTalk with Printing Errors (7/95)

Revised: 7/20/95
Security: Everyone

Slow Start Up: LocalTalk with Printing Errors (7/95)

=====

Article Created: 18 May 1995
Article Reviewed/Updated: 20 July 1995

TOPIC -----

I have a Macintosh that takes a long time to start up (3 to 5 minutes), and I sometimes get printer communication errors, or the printer is not available after seeing it in the Chooser. What can I do to fix this?

DISCUSSION -----

Removing the LocalTalk connector may help identify a "slow boot" issue. A replacement LocalTalk connector may re-establish proper network operations.

Part of a Macintosh computer's start up sequence is to connect to the network. The steps vary, depending on which type of networking is being done (LocalTalk, EtherTalk, or TokenTalk). If there is a problem with a LocalTalk connector or Ethernet Transceiver, the start up process may appear slower than normal.

When EtherTalk is selected in the Network control panel and a network problem arises, an error message is issued about not being able to connect to Ethernet, and LocalTalk is used. This lets the user know they have an Ethernet problem of some kind. However, if LocalTalk is selected in the Network control panel and a problem exists, there is no equivalent error message. The Macintosh appears to do nothing for about two minutes while it attempts to establish a network connection, then give up assuming the network is not functioning.

When troubleshooting start up problems, or doing clean System Software installs, it is a good idea to remove all of the cables from your Macintosh, EXCEPT the monitor, keyboard, and mouse cables. Doing this can help identify potential problems associated with external connections.

NOTE: Slow start up times may also happen when you have a serial printer, which is turned off and not plugged into power, connected to either the modem or printer port.

MegaPhone: -93 Error Bomb (5/95)

Revised: 5/18/95
Security: Everyone

MegaPhone: -93 Error Bomb (5/95)

=====

Article Created: 18 May 1995

TOPIC -----

This article describes the MegaPhone -93 error bomb.

DISCUSSION -----

We spoke with Cypress and they are aware of this bug planning a fix for around the end of June 1995. This only occurs when MegaPhone tries to forward a call to PowerTalk on a network with no Zones (the '*' zone) in the Chooser. You can put a router on the network.

If you need demonstrate MegaPhone and PowerTalk, try this: Do not use the Universal Mailbox to get mail on networks with no zones, and pre-load the mailbox with voice messages prior to running the demo on a zone-less network.

MAE: Setting Up An Application For Multiple Users (8/95)

Revised: 8/31/95
Security: Everyone

MAE: Setting Up An Application For Multiple Users (8/95)

=====

Article Created: 18 May 1995
Article Reviewed/Updated: 28 August 1995

TOPIC -----

We are trying to get MS Office to run under MAE. We want all the accounts to run the same copy of the application, to minimize set up and configuration time. We couldn't find any advice in the manuals.

Has anyone set up an environment where a single copy of an application which generates preferences is used by multiple accounts simultaneously?

Has anyone been able to create a standard build that can be propagated to multiple MAE users?

DISCUSSION -----

Setting up an application this way lets you reduce the amount of server RAM and disk space required for the application. It also lets you minimize set up and configuration time.

Here are the steps to set up an application for multiple users:

Step 1

As "root", create a directory called Applications in the /usr/apple directory. Place all the applications that users will have access to in this directory.

Be sure to instruct users NOT to copy these applications to their home directory, since this would use more disk space and defeat the purpose for doing this.

Step 2

After adding applications to the Application directory in the apple Directory, it is best to rebuild the desktop letting MAE add the applications to the

desktop files. To do so, start with the -rebuild option.

Step 3

Add the following line to the /usr/apple/lib/AliasList file:

```
persistent|desk|/usr/apple/Applications
```

This ensures that an alias of the Applications directory is on the user's MAE desktop.

PowerTalk Aware Applications in Startup Items Folder (5/95)

Revised: 5/19/95
Security: Everyone

PowerTalk Aware Applications in Startup Items Folder (5/95)

=====

Article Created: 19 May 1995

TOPIC -----

My PowerTalk aware applications do not recognize PowerTalk when they launch from the Startup Items folder at start up. Usually, the mail option is disabled or an error message appears saying PowerTalk is not available. Quitting the application and launching it again resolves this, but why don't the applications work with PowerTalk when launched at start up?

DISCUSSION -----

Applications launched from the Startup Items folder may not find PowerTalk available because at start up, the Finder launches PowerTalk after the items in the Startup Items folder start. When the applications look for PowerTalk while starting up, PowerTalk is not available. You can either quit and then launch the applications again, or launch the applications after the computer has finished its start up process.

MAE: Files In MAE Not Same Size As Reported In UNIX (5/95)

Revised: 5/19/95
Security: Everyone

MAE: Files In MAE Not Same Size As Reported In UNIX (5/95)

=====

Article Created: 19 May 1995

TOPIC -----

I have noticed that when I copy files from a CD, the file size on the UNIX File system is larger. What is happening?

DISCUSSION -----

This is due to MAE's default way of storing files in AppleSingle format. Mac OS files have both a resource and data fork, and MAE must handle these files differently on a UNIX File system. To accomplish this, AppleSingle is used where the resource fork information is pre-appended to the data fork and creates one file. This combining of files creates the larger file you see in UNIX.

You can change this default, from AppleSingle to AppleDouble, by launching MAE with the "-filedouble" option. This keeps Mac OS files as separate data and resource forks. From within MAE, AppleDouble files will appear as one file, however within UNIX, you will see a file name "name" (the data fork) and "%name" (the resource fork). Then the file "name" will then report the same size in UNIX as in the Finder.

Starting MAE From X Client As User Other Than Login User (5/95)

Revised: 5/19/95
Security: Everyone

Starting MAE From X Client As User Other Than Login User (5/95)

=====

Article Created: 19 May 1995

TOPIC -----

When I log into our X Client as "USER1", and then 'su -l' to "MAEUSER" to start MAE from the X Client, I am unsuccessful. Our current setup has a particular user named "MAEUSER" which is setup to start MAE, we also want to keep this setup. What is wrong?

DISCUSSION -----

When you 'su -l' to a different user, some environment variables do not transfer to the new user, one of them being DISPLAY. For this to function, follow the steps below:

Step 1

After 'su -l' to the user that has access to MAE, set the DISPLAY variable in this manner:

```
#ksh
#DISPLAY=IP address of X Server:0.0  <- You may also use the X Server name
.                                     rather than IP Address.
#export DISPLAY
```

Step 2

Start MAE with extensions off with this command:

```
#./apple/bin/mae -noextensions
```

Step 3

When trying to use MAE in this environment, CloseView will cause MAE to hang during launch. After starting MAE with extensions off, remove the CloseView control panel (or use the Extension Manager). If you have several users with

this setup, it would be advisable to remove the CloseView control panel from
./apple/sys/Control Panels/CloseView so that any system folder created will not
have this control panel.

Power Macintosh: Virtual Memory Status Issue (8/95)

Revised: 8/31/95
Security: Everyone

Power Macintosh: Virtual Memory Status Issue (8/95)

Article Created: 19 May 1995
Article Review/Updated: 31 August 1995

TOPIC -----

I notice in the Memory Control Panel of my Power Macintosh 8100/110 that virtual memory (VM) is shown as being active, yet some native applications are occupying significant portions of memory. I thought that virtual memory alleviated this problem?

DISCUSSION -----

There has been some confusion, regarding the actual status of the virtual memory setting, on Power Macintosh 8100/110, 8100/100 and 7100/80 computers with 16MB of RAM, when the system software was installed at the factory.

The problem is that the Memory control panel shows that VM is "on" when it is actually "off". The About This Macintosh window correctly shows that virtual memory is not turned on.

This problem only occurs on these specific computers as they come with system software factory-installed. Subsequent installations from the CD will not exhibit this confusion with the Memory control panel, as VM defaults to "off" when installed from the CD.

To obtain the best memory usage with native applications, go into the Memory control panel, turn VM off, turn VM back on, set the VM size to the desired amount of memory, and then restart the Power Macintosh.

Netware and 999 MB Size on Volumes Larger Than 4 GB (7/95)

Revised: 7/19/95
Security: Everyone

Netware and 999 MB Size on Volumes Larger Than 4 GB (7/95)

Article Created: 22 May 1995
Article Reviewed/Updated: 19 July 1995

TOPIC -----

I have a Macintosh with System 7.5, and when I connect to our Novell file server the reported volume size is 999 MB. I talked to our Novell administrator and was informed that the volume is a 9 GB partition. I also checked another Macintosh with System 7.1 and the same Novell file server volume reports 999 MB. Doesn't System 7.5 see 4 GB volumes and System 7.1 and earlier see 2 GB volumes?

DISCUSSION -----

A Novell server does not use HFS (Hierarchical File System) as its file system; it has the ability to emulate HFS. Novell implemented a workaround to the HFS 2 GB (pre-System 7.5) and 4 GB (System 7.5) limit in the Netware 3.12 and 4 versions of their network operating system.

The workaround essentially interprets the AFP (AppleTalk Filing Protocol) calls and returns a volume size of 999 MB. This is NOT a bug, but a Novell adjustment to the HFS volume size limit. File transfer and other server functions should operate correctly for the whole volume. What happens is Netware shows 999 MB of the multi-GB volume at a time. It is like a scrolling window within the volume window.

To illustrate, if you double click the volume icon you are presented a window showing you the files and folders on the volume (just like any other volume). The difference is you are seeing only a 999 MB portion of the volume. If you scroll down to the bottom of the window, or the end of this first 999 MB portion, Netware then presents to you the next 999 MB portion of the multi-GB volume. This process continues, 999 MB portion by 999 MB portion, making the entire multi-GB volume visible and usable.

AWS 95 and/or A/UX 3.x: Desktop Rebuilds Every Time (5/95)

Revised: 5/22/95
Security: Everyone

AWS 95 and/or A/UX 3.x: Desktop Rebuilds Every Time (5/95)

=====

Article Created: 22 May 1995

TOPIC -----

Every time I restart my Apple Workgroup Server (AWS) 95 or start Mac32, my desktop file rebuilds. I've run fsck, deleted the desktop files, and created a new system folder, all to no avail.

DISCUSSION -----

To keep the Desktop from rebuilding, look for a file or folder called /Desktop. In some cases, the file will be visible in the finder, if its not visible, go to the command shell and type:

```
ls -l /
```

The output should include a line similar to:

```
-rw-r--r--  1 root      root           5 May 16 19:24 Desktop
```

NOTE: If the first character is a "d" instead of a "-", the Desktop file is a directory.

We believe that Mac32 is seeing the Desktop file or folder as a System 6 desktop file, and is trying to convert the desktop file for use in System 7.

Normal Mac OS behavior would rebuild the desktop once. However, A/UX does not handle this correctly and rebuilds the desktop file every time Mac32 is started. The solution is to remove the file or folder. If the file or folder is visible, throw "Desktop" in the trash. Otherwise, go to command shell:

- If /Desktop is a file, remove the file with:

```
rm /Desktop
```

- If /Desktop is a directory, remove the directory with:

```
rm -r /Desktop
```

WARNING: We recommend checking the contents of the directory before using the remove command. Once the directory is deleted, the files will be lost forever.

Telecom 2.0: Different Features Depending on Computer (7/95)

Revised: 8/7/95
Security: Everyone

Telecom 2.0: Different Features Depending on Computer (7/95)

=====

Article Created: 22 May 1995
Article Reviewed/Updated: 27 July 1995

TOPIC -----

This article explains the general feature set of the Telecom 2.0 software.

DISCUSSION -----

The latest GeoPort and Express Modem software releases prior to the Telecom 2.0 software were:

- GeoPort for 68000-based Macintosh AV computers 1.2.2
- GeoPort for Power Macintosh computers 1.0.2
- Express Modem 1.5.5

General Description

=====

Although the software for GeoPort Telecom Adapter and Express Modem hardware share the same code base and have common installer disks, the feature set depends on the hardware you are using.

Common Features For PowerBook, 68000 Macintosh AV,
and Power Macintosh Computers

- Single installer for Apple Fax/Data Modem, Express Modem, Express
 . Modem card, GeoPort for Quadra AV, GeoPort for Power Macintosh
- QuickDraw GX fax driver
- Fax Terminal with System 7.5 freeze bug fixed
- Fax MSAM for PowerTalk

- OCR
- Fast Fax Printing
- Improved fax compatibility

Common 68000-based Macintosh AV and Power Macintosh Features

- Telephone Manager 2.0
- Telephone Tool for CTB support
- Sound Drivers for telephone line and telephone Speakerphone
- Bundled Screen Based Telephone and Voice Message Machine
- Simplified interface for port selection
- Bundled Terminal Emulator (SitComm SE) <- only in kit and via
. UCA upgrade

Power Macintosh Only Features

- Native V.42/V.42bis (error correction/compression) for higher data
. throughput and lower CPU overhead
- Optimized LocalTalk performance when using GeoPort Telecom Adapter

Power Macintosh and PowerBook features

- V.17 Fax giving 14.4 Kbps send/receive (currently fax is 9600 and
. data is already 14.4 Kbps)

GeoPort Adapter: Conflict with DOS Compatibility Card (3/97)

Revised: 3/12/97
Security: Everyone

GeoPort Adapter: Conflict with DOS Compatibility Card (3/97)

=====

Article Created: 22 May 1995
Article Reviewed/Updated: 12 March 1997

TOPIC -----

When I try connecting to the GeoPort Telecom Adapter from my Power Macintosh DOS Compatibility Card, the DOS Compatibility Card hangs. If I use my Macintosh communication applications or temporarily use an external modem with the DOS Compatibility Card, everything works properly.

DISCUSSION -----

The GeoPort has not been tested with any version of Apple Computer's DOS Compatibility products, and it is not supported in this environment.

Affected Products

- DOS Compatibility Card for Power Macintosh 6100 or Performa 6100 Series.
- 7-in. and 12-in. PC Compatibility Cards for Power Macintosh Computers.
- GeoPort Telecom Adapter (includes ALL versions internal and external).

This article appeared in the Information Alley on 26 September 1996.

Article Change History:

12 Mar 1997 - Updated to reflect internal adapters also affected.
25 Sep 1996 - Changed distribution status.
22 May 1996 - Added PC Compatibility Card info.

LW Pro 810: Set Up In RPRINTER Mode For Netware 4.1 (5/95)

Revised: 5/25/95
Security: Everyone

LW Pro 810: Set Up In RPRINTER Mode For Netware 4.1 (5/95)

Article Created: 25 May 1995

TOPIC -----

How do I set up a LaserWriter Pro 810 in RPRINTER mode on a Netware 4.1 server?

DISCUSSION -----

Here is the NetWare v4.10 LaserWriter Pro 810 QuickStart

Summary
=====

- Create a print server.
- Create a printer from within the print server configuration menu options.
- Create a print queue from within the printer configuration menu options.
- Turn printer off and then back on to have changes take effect.

QuickStart
=====

Step 1

Turn printer off, then on, and retrieve the printer's startup page.

Step 2

Type SET BINDERY CONTEXT at the server's console prompt, to ensure that the context has been set. Write the context down, as it will be needed later.

Step 3

Login to a file server from a DOS client using the Admin account.

Step 4

At the DOS prompt, type PCONSOLE, and press Enter.

Step 5

Use the arrow keys to highlight Change Context in the menu, and press Enter.

Step 6

Change the PCONSOLE utility's context to match the context set on the server (what you wrote down earlier), by pressing the Insert key, and selecting the correct context.

Step 7

Use the arrow keys to highlight Print Servers in the menu, and press Enter.

Step 8

Press the Insert key, then type a descriptive name for your print server. This can be any name but in general you should be able to glance at the object and know what it's purpose is. IE: "810_Server".

Step 9

Select the name of the print server you specified in the previous procedure and press Enter.

Step 10

Use the arrow keys to highlight Printers in the Print Server Information menu, and press Enter (this will let you configure the new print server).

Step 11

Press the Insert key to display printers in your current context in the NetWare Directory Services tree.

Step 12

Press the Insert key to create a new printer in the NetWare Directory Services tree (the context listed at the top of the screen should still list the server's bindery context that was set earlier, if not, change to the correct context *before* creating the printer!).

Step 13

At the prompt, type the new printer name and press Enter. The printer name "must" be the virtual printer name that is displayed under virtual printers when

you print the startup page. The name beginning PSL20N.... is the postscript Virtual Printer. The name beginning LJL20N.... is the PCL4 Virtual Printer.

Step 14

Select the name of the printer you specified in the previous procedure and press Enter (this will add the printer to the Serviced Printer list of the print server).

Step 15

From the Serviced Printers menu list, select the name of the printer you specified in the previous procedure, and press Enter. This will bring up a Printer Configuration menu.

Step 16

From the Printer Configuration menu, use the arrow keys to highlight Printer type, and press Enter.

Step 17

From the Printer Type menu, use the arrow keys to highlight Other/Unknown, and press Enter. This will make your selection active, and bring you back to the Printer Configuration menu.

Step 18

If most of the printing to this printer will be Postscript, and not PCL, then from the Printer Configuration menu, use the arrow keys to highlight Banner type, and change the banner type from Text to Postscript. This will limit the number of times the printer will have to switch modes between PCL and PostScript.

Step 19

From the Printer Configuration menu, use the arrow keys to highlight Print queues assigned, and press Enter. This will bring up the Print Queue menu list.

Step 20

Press the Insert key to display print queues in your current context in the NetWare Directory Services tree. For this example, we will create a new queue.

Step 21

Press the Insert key to create a new print queue in the NetWare Directory Services tree (the context listed at the top of the screen should still list the server's bindery context that was set earlier, if not, change to the correct context *before* creating the print queue!).

Step 22

At the prompt, type the new queue name and press Enter. You will then be asked for the NetWare volume to store your NetWare print queue jobs on. With NetWare v4.xx, the NetWare queue does not have to exist on the SYS volume -- you can place the queue on any volume you want. Use the insert key to select the volume from the directory tree (you may need to navigate to a different context to select the volume desired).

Step 23

Select the name of the queue you specified in the previous procedure and press Enter (this will add the queue to the Print Queue list of the printer).

Step 24

Press the Escape key until you are prompted to save your changes.

Step 25

Start PSERVER on your 4.1 File Server by typing "LOAD PSERVER <Print Server Name>"

Step 26

Turn the printer off, and then back on again, to initialize the printer, and have it connect to its printer definition within NetWare.

Step 27

Submit a print job to the printer to ensure it is working. If printing from a PC, it is highly recommended that you use the FONTLIST.PS file in SYS:SYSTEM\NW-MAC\PSUTILS, since it is a known good file, and you will not add additional variables like misconfigured applications or drivers. Once you know that printing is working through the queue, you can use more complex print setups to ensure your environment is configured correctly.

Note:

These series of steps is only one of many ways that can be used to create the same configuration. For example, rather than creating all the printers and print queues from within the print server main menu option, many administrators may choose to create the queues and printers from the main menu options first, then connect the queues and the printers to the print server afterward. The same result will be reached in each case, as long as the information in each entry is entered the same way in whatever approach is taken.

Does Apple Support Enhanced IDE (7/95)

Revised: 7/17/95
Security: Everyone

Does Apple Support Enhanced IDE (7/95)

Article Created: 23 May 1995
Article Reviewed/Updated: 17 July 1995

TOPIC -----

Is computer IDE Interface used in some Macintosh computers, such as the Macintosh 5200 series, Performa 6200 series, Macintosh 630 family, and the Macintosh LC and Performa 580, the same as the Enhanced IDE interface? If not what are the differences?

DISCUSSION -----

IDE's basic design is limited to magnetic media and does not work for tape, optical, or CD-ROM devices. PC vendors have addressed IDE's problems with an Enhanced IDE specification, which supports more drive units, greater throughput, and higher-capacity mechanisms. It also permits easier attachment of CD-ROM drives. The Enhanced IDE Interface is also known as the ATA (AT attachment) Interface.

Apple's implementation of the ATA interface is a subset of the ATA interface specification, ANSI proposal X3T9.2/90-143. Revision 3.1. Current IDE capable Macintosh systems support IDE drives that include a feature called Logical Block Addressing (LBA). LBA is the method that drive manufacturers have adopted in order to go beyond the 520 MB DOS-BIOS limit.

In summary, the Apple IDE Interface supports IDE and Enhanced IDE drives. However, any IDE drive that is going to be used on Macintosh computers must support Logical Block Addressing (LBA).

Apple Internet Mailing Lists: How to Subscribe (1/97)

Article Created: 23 May 1995
Article Reviewed/Updated: 27 January 1997

TOPIC -----

Apple Computer, Inc. provides a number of mailing lists that can keep you informed of the latest information in the following areas. Any customer with an Internet email address or a commercial online service account with Internet email access can subscribe and unsubscribe to any of the following mailing lists.

DISCUSSION -----

- 1) Apple Press Releases - receive copies of all press releases created by Apple.
- 2) Apple Information Alley - receive the now daily Information Alley, containing the latest tips and information on using and supporting Apple products.
- 3) You can obtain the latest information on where to find Apple Software Updates via automated email. Below are the documents we currently have available, where to send the email message to and what to type so you can obtain the latest information related to Apple SW Updates.
- 4) Apple Developer Directions Express - Summarizes the latest Developer News from Apple - what's happening at Apple, how we're doing, what we're thinking about, and where we're headed. What we send you will be the latest, most interesting, and--we hope--most useful information Apple has to offer. We'll try not to bug you too much--three or four times each month is what we currently plan, but both the content and the frequency of this mailing list may change, depending on reader feedback.

How To Subscribe:

1) Apple Press Releases

To subscribe:

- Send an email message to: `pressrel@thing2.info.apple.com`
- In the message SUBJECT field, type: `subscribe`

You'll receive an automated reply letting you know you've been added to the list.

To unsubscribe:

- Send an email message to: `pressrel@thing2.info.apple.com`
- In the message SUBJECT field, type: `unsubscribe`

You'll receive an automated reply letting you know you've been removed from the list.

2) Apple Information Alley

To subscribe:

- Send message to: `listproc@whoville.austin.apple.com`
- Message: `subscribe infoalley <Your Real Name>`

You'll receive an automated reply letting you know you've been added to the list.

To unsubscribe:

- Send message to: `listproc@whoville.austin.apple.com`
- Message: `unsubscribe infoalley`

You'll receive an automated reply letting you know you've been removed from the list.

3) Apple Software Updates

* Where to find Apple Software Updates

-> Send email to `info@thing1.info.apple.com` with the subject: `swwhere`

* US Apple Software Updates Available Online - Current Apple SW Updates Available online.

-> Send email to `info@thing1.info.apple.com` with the subject: `swupdates`

* Worldwide Apple Software Updates Available Online - Current Worldwide Apple SW Updates Available Online.

-> Send email to `info@thing1.info.apple.com` with the subject: `wwswupdates`

* Current list of all Apple Mailing Lists

-> Send email to `info@thing1.info.apple.com` with the subject: `listinfo`

The information you requested will be sent by reply mail as soon as possible.

To subscribe:

- Send an email message to: `swupdates@thing1.info.apple.com`
- In the message SUBJECT field, type: `subscribe`

You'll receive an automated reply letting you know you've been added to the list.

To unsubscribe:

StyleWriter II/StyleWriter 1200: Levels of Gray (5/95)

=====

Article Created: 22 May 1995

TOPIC -----

How many levels of gray can one expect to get when printing from the StyleWriter 1200? Is it different from the StyleWriter II?

DISCUSSION -----

The StyleWriter 1200 is identical to the StyleWriter II as far as its gray level printing capability. Both the printers are capable of printing 138 levels (shades) of gray at 360x360dpi resolution.

CD-ROM: Standards Used (8/96)

=====

Article Created: 24 May 1995
Article Reviewed/Updated: 19 August 1996

TOPIC -----

This article contains a list of CD-ROM Standards, or formats, and their definition.

DISCUSSION -----

You may hear or see several terms used to define CD-ROM discs and drives. These include Red Book, Yellow Book, White Book, and Green Book. Some of these standards, such as the White Book, are derived from previous standards, but with added features.

Red Book

The Red Book specification is for digital audio CDs. All audio CDs use this specification to assure that any audio CD-ROM in the world works with any audio CD-player. The Red Book specification was developed by Phillips and Sony.

Yellow Book

The Yellow Book specification is used for computer-based CD-ROMs. The Yellow Book specification only defines the physical arrangement of the data on the disc. Other standards are used in conjunction with the Yellow Book to define directory and file structures. These include ISO-9660, HFS, and Hybrid HFS-ISO. Sector formats are defined as Mode 1, Mode 2, and CD-ROM/XA.

ISO-9660

This file system standard is a "lowest common denominator" format. It only allows for an 8.3 filenames (EIGHT__8.TXT). There is an extended ISO-9660 file system, called the Rock Ridge extension, used primarily for UNIX CD-ROMS that allows for longer UNIX file names and directory structures.

HFS

This file system is designed to support Macintosh features not supported under the ISO-9660 standard. This includes longer file names (up to 31 characters), custom icons, and other Finder features such as comments and labels.

Hybrid HFS-ISO

This file system is a combination of ISO-9660 and HFS. This format is used by CD-ROM developers on products designed for both the Macintosh and MS-Windows or UNIX platforms.

Mode 1

Mode 1 CD-ROMs contain only computer data, and have 2048 byte sectors.

Mode 2

Mode 2 CD-ROMs contain compressed audio data and video/picture data, and have 2324 byte sectors. Mode 2 sectors also contain end-of-record markers, interrupt triggers, and data type specifications.

CD-ROM/XA

CD-ROM/XA (CD-ROM Extended Architecture) is an extension of the Mode 2 format. Like Mode 2 it contains compressed audio and video/picture data. The CD-ROM/XA format however offers the ability to interleave the Mode 2 compressed audio and Mode 2 data sectors.

White Book

This specification covers the Video CD format.

Green Book

This specification builds on the Red Book and the Yellow Book, and is designed for CD-I discs (Compact Disc-Interactive).

Orange Book

This specification covers writable CDs, including CD Recordable (CD-R), magneto-optical cartridge systems and single and multisession recordings.

CD+ (CD Plus)

This specification is still being worked on by both the computer and music industry. It is a derivative of the CD+MM format, which combines computer multimedia elements with a standard audio CD-ROM. With the current CD+MM format, Track 1 contains the computer data, and when placed into an audio CD-player, Track 1 must be skipped. The goal is to have a CD-ROM that will contain both audio and computer data on one disc, and when placed into an audio CD-player plays only the audio tracks. All computer data is ignored without any manual assistance.

AWS 95: Opening Files Above the Finder Limit (5/95)

Revised: 5/24/95
Security: Everyone

AWS 95: Opening Files Above the Finder Limit (5/95)

=====

Article Created: 24 May 1995

TOPIC -----

I have seen that an Apple Workgroup Server (AWS) 95 can open a maximum of 5000 files. Is this only under certain conditions, or is the finder required to open these files or does an application open them?

DISCUSSION -----

AppleShare and the Finder cannot use the maximum number of open files available by an AWS 95 running A/UX. However ORACLE, INFORMIX, and other applications along with A/UX shell scripts can use the higher open file limit. For example, a 5000 open file limit may let the server concurrently serve ftp, NFS, and AppleShare (this configuration is not officially supported).

CloseView: Does Not Magnify Video Monitor Window (5/95)

=====

Article Created: 26 May 1995

TOPIC -----

I am visually impaired and want to use CloseView to magnify the Video Monitor window. I have a Power Macintosh (8011/80 AV) running System 7.5. How do I do this?

DISCUSSION -----

CloseView works on a Power Macintosh running System 7.5, but it does not magnify the Video Monitor window. Apple is aware of the problem and has it under investigation.

Workaround

You can view magnified video input using Apple Video Player and CloseView. This workaround does not work in thousands of colors, but it does work in 256 and 16 colors.

Please note that Apple Video Player has not been tested on a Power Macintosh and this configuration is not supported by Apple at this time.

QuickTake 150 For Windows: Read Me (5/95)

Revised: 5/26/95
Security: Everyone

QuickTake 150 For Windows: Read Me (5/95)

Article Created: 26 May 1995

TOPIC -----

This article contains the QuickTake 150 for Windows README.TXT file.

DISCUSSION -----

This Read Me contains information about:

- special settings for serial ports COM3 and COM4
- PICT QuickTake file format
- sharing QuickTake images with a Macintosh computer
- printing slide tables

SETUP FOR COM3 AND COM4

=====
If you connect the QuickTake camera to COM3 or COM4 and experience communication problems, you need to check the Windows Ports control panel settings. (The Control Panel group is located in the Main window.)

1. Open the Windows Ports control panel.
2. Select COM3 or COM4. (Repeat this process for both COM ports.)
3. Click the Settings button.
4. In the dialog box that appears, click the Advanced button.
5. In the Advanced Settings dialog box, make sure the settings are:
 - . - COM1 3F8 IRQ4
 - . - COM2 2F8 IRQ3
 - . - COM3 3E8 IRQ4
 - . - COM4 2E8 IRQ3
6. Click OK.

If you changed the settings, you must restart Windows for the new settings to take effect. When you click OK, a message lets you choose to restart now or delay the restart.

If you are using several serial devices with your computer, make sure that the line IRQSharing=ON exists in the [386enh] section of the SYSTEM.INI file.

Consult the manual that comes with your computer (or card) if the above settings do not work.

PICT QUICKTAKE(.QTK) FILE FORMAT =====

The PICT QuickTake(.QTK) is not the Macintosh standard PICT(.PIC) file format. You will not be able to open QuickTake(.QTK) images with PICT(.PIC) supported applications. Our recommendation is to save it in JPEG or TIFF format to transfer images to other applications.

SHARING QUICKTAKE IMAGES WITH A MACINTOSH COMPUTER =====

To transfer QuickTake images from a Macintosh to a Windows computer:

1. Make sure PC Exchange (or a similar program) has been installed on the Macintosh.
2. Insert a DOS formatted disk into a floppy disk drive on the Macintosh.
3. Copy the Macintosh QuickTake files to the disk, and move them to your computer.

NOTE:

You can only transfer images that are in PICT QuickTake or TIFF format.

To transfer QuickTake images from a Windows computer to a Macintosh:

-
1. Make sure PC Exchange (or a similar program) has been installed on the Macintosh.
 2. Insert a DOS formatted disk into a floppy drive on the Windows computer.
 3. Copy the QuickTake files to the disk, and move them to the Macintosh.

NOTE:

You can transfer PICT QuickTake images (with the QTK extension). Next, so you can open the images on the Macintosh, you need to assign the file type:

4. Open the PC Exchange control panel on the Macintosh.
5. In the dialog box that appears, click Add.
6. In the "DOS Suffix" box, type .QTK.
7. In the scrollable list, find TeachText, SimpleText, or your favorite image editing application and select it.
8. Choose PICT from the "Document Type" pop-up menu.
9. Click OK. The first PC Exchange dialog box reappears, and the QTK file type has been assigned to the selected application as a PICT file type. Now you can open and view the files in any Macintosh

- . application that reads PICT. In addition, if you open an image in
- . the QuickTake application, you can save it in the other file formats
- . available on the Macintosh (PICT, JPEG, and TIFF).

NOTE:

If you are transferring Macintosh files to a Windows computer on a network, only transfer images that are in PICT QuickTake or TIFF format. If you are transferring Windows files to a Macintosh on a network, only transfer images with the QTK extension.

PRINTING SLIDE TABLES

=====

Before you print a slide table, be sure to use the highest resolution available for your printer. When you choose the Print command, the dialog box that appears shows the current setting for print resolution.

To print full-size images you can use any resolution.

CloseView: Can it Do Screen Inversion Only? (6/95)

Article Created: 26 May 1995
Article Reviewed/Updated: 1 June 1995

TOPIC -----

I have vision impairment and prefer the video to be inversed in CloseView. I do not need the zoom effects. How can I do this? Is there a ResEdit or third party solution?

DISCUSSION -----

There is no ResEdit solution available to do this. However there is a solution available from Berkeley Access called inLarge. inLarge lets you enable just "screen inverse" functionality. You can download a version of the software via the Internet at:

<http://access.berksys.com/>

or from AppleLink at:

- . Community Connection
- . Disability Solutions
- . Empower BB
- . Access Software Library (Share & Freeware)
- . Vision
- . inLarge 2.0a Demo

Please note that version 2.0a of inLarge is not compatible with Power Macintosh systems. Contact Berkeley Systems directly for information about the availability of a compatible version.

This article provides information about a non-Apple product. Please contact the vendor for additional information.

Power Macintosh 5200/75 LC: 8-bit or 16-bit Sound? (10/95)

Revised: 10/23/95
Security: Everyone

Power Macintosh 5200/75 LC: 8-bit or 16-bit Sound? (10/95)

=====

Article Created: 26 May 1995
Article Reviewed/Updated: 23 October 1995

TOPIC -----

Does the Power Macintosh 5200/75 LC use 8-bit or 16-bit sound?

DISCUSSION -----

The original Power Macintosh 5200/75 LC supported 8-bit mono sound input and 8-bit stereo sound output at 11.127 or 22.254 kHz sample rates. When playing audio CDs, the Power Macintosh 5200/75 LC plays the audio using 16-Bit stereo at 44 kHz, retaining the CD quality sound.

In July 1995, the Macintosh 5200/75 LC and Performa 5200 series computers began shipping with 16-bit sound input as well. You can tell which input options your computer has by following this procedure:

Step 1

Choose Control Panels from your Apple menu.

Step 2

Open the Sound control panel.

Step 3

Choose "Sound Out" from the "Alert Sounds" pull down menu. If the 16-bit sound input radio button is grayed out, you only have 8-bit input.

If 16-bit is not grayed out, make sure there is a dot in the radio button next to it.

Step 4

Use the close box in the upper left corner to close the Sound control panel.

Article Change History:

23 Oct 1995 - Added test to check sound input option.

AppleShare 4.2: How to Update (6/96)

Revised: 6/3/96
Security: Everyone

AppleShare 4.2: How to Update (6/96)

=====

Article Created: 1 June 1995
Article Reviewed/Updated: 3 June 1996

TOPIC -----

This article describes how to update to AppleShare 4.2.

DISCUSSION -----

AppleShare 4.2 will not be available as a stand-alone product, it will only be sold with Workgroup Server bundles and upgrades from AppleShare 4.x. AppleShare 4.2 is supported only on NuBus equipped PowerPC-based Power Macintosh and Workgroup Server computers.

How to Order the AppleShare 4.2 Update

- Upgrades from 4.0, 4.0.1, 4.0.2 or 4.1 versions of AppleShare are available from the Apple Order Center.
- Customers who purchased AppleShare 4.x BEFORE September 1, 1995 can receive the Upgrade for \$199 plus tax and \$6.95 shipping/handling.
- Customer who purchased AppleShare 4.x September 1, 1995 or later receive the upgrade for only a \$6.95 shipping/handling fee.
- Upgrades are expected to be available in November 1995.
- All orders must be received by January 15, 1996.
- Proof of AppleShare 4.x purchase is required.

NOTE: Customers must use their existing AppleShare 4.x serial number to activate the server.

Outside the U.S., customers should contact their local Apple reseller or representative for information on upgrading to AppleShare 4.2 in their local

language.

AppleShare 4.0.2 and 3.0.1 Continued Availability

Customers wanting to repurpose an existing Quadra (or other 68040-based Macintosh) as an AppleShare server can do so by purchasing AppleShare 4.0.2 from their Apple Reseller. AppleShare 4.0.2 is designed for 68040-based Macintosh computers only and will not install or run on PowerPC-based systems. AppleShare 3.0.1 continues to be available for Macintosh computers with a 68030 or earlier processor.

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center's phone number.

Article Change History:

03 Jun 1996 - Updated for technical accuracy.

04 Jan 1996 - Updated for AppleShare 4.2.

26 Sep 1995 - Added Info Alley information.

AudioVision 14 Display: Monitor requires ADB connection (5/95)

Revised: 5/30/95
Security: Everyone

AudioVision 14 Display: Monitor requires ADB connection (5/95)

=====

Article Created: 30 May 1995

TOPIC -----

I have an AudioVision 14 Display that I am using with the AudioVision adapter on my Power Macintosh computer. However when I power on the computer, I get a X through the ~AudioVision extension. Why?

DISCUSSION -----

When using the AudioVision adapter, you must also have the ADB cable connected to the ADB port on the AudioVision 14 Display. The ~AudioVision extension polls the ADB port on the computer to see if the display is connected. If the extension does not sense the AudioVision 14 Display, an X appears over the extension at startup.

If you are using the AudioVision 14 Display connected to the HDI-45 video connector on a Power Macintosh, then there will be an ADB connection built in to the HDI-45.

However, if you are using the AudioVision adaptor (a cable with multiple cables and connectors on it), make sure the ADB part of the adaptor is connected to the computer. Otherwise, if there is no ADB cable going from the computer to display, the extension will not detect the monitor. Once you connect an ADB cable from your computer to the AudioVision 14 Display, you can connect your keyboard to one of the other ADB ports on the display.

In cases where the ADB cable is connected, and you still get the AudioVision extension loading with an 'X', you may need to reset the AudioVision 14 Monitor using the procedure described in the Tech Info Library article titled "AudioVision 14" Display: How to Reset the Monitor." Another Tech Info Library article titled "AudioVision Display: "X" Displayed Through the Video INIT" describes other conditions under which the extension loads with an 'X' through it.

LaserWriter 8.x: Compatible with Level 1 PS (5/95)

Revised: 5/30/95
Security: Everyone

LaserWriter 8.x: Compatible with Level 1 PS (5/95)

Article Created: 30 May 1995

TOPIC -----

We have a Quadra 800 running system 7.5.1 with LaserWriter driver 8.2.2. When we print to an original LaserWriter, we get frequent PostScript errors. Prints fine from LaserWriter Driver 7.2

A related article "LW Driver 8.1.1: PostScript Errors with Bitmapped Fonts" says that there are problems printing from the LaserWriter 8 driver to the original LaserWriter due to shortage of RAM. It seems to indicate that this problem is specific to the original LaserWriter. I've heard that Apple does not recommend using the LaserWriter 8 driver with any PostScript Level 1 printer because they are not fully supported, and the customers with level 1 printers should use the 7.2 driver. Is this true? It seems to me that LaserWriter 8 should work as long as the printer has sufficient RAM (such as a LaserWriter IINTX or Personal LaserWriter NT with 4+ MB of RAM).

DISCUSSION -----

You are correct that using LaserWriter 8.x with PostScript Level 1 printers should work just fine. This is because LaserWriter 8 queries the printer at the beginning of the print job to determine if it is a PostScript Level 1 or Level 2 printer. LaserWriter 8.x is able to generate PostScript Level 1 code if it finds it is speaking to a PostScript Level 1 printer.

We are not aware of any performance tests that compare printing to a Level 1 printer from LaserWriter 7.2 and LaserWriter 8.x. Our suggestion would be to use the print driver that is more compatible with version of system software running (for example, LaserWriter 8 with systems 7.5). If you run into trouble with this, then you can try using LaserWriter 7.2 to see if it helps.

In using LaserWriter 8.x with the original LaserWriter printers, here are some suggestions that might help in printing:

- Try using ONLY the fonts available in the LaserWriter's ROM; not TrueType or

Type 1.

- Enable "Unlimited Downloadable Fonts" in the options dialog of Page Setup.

LaserWriter: Registration Can Vary (5/95)

Revised: 5/31/95
Security: Everyone

LaserWriter: Registration Can Vary (5/95)

Article Created: 31 May 1995

TOPIC -----

I have a LaserWriter Select 300 and when I print five identical pages, no two pages align perfectly. These pages vary up to 1/16th of an inch. Why?

DISCUSSION -----

It is very common for LaserWriter registration to vary from page to page. Some print engines may have a larger degree of variation than others depending upon the design of the engine. Several variables have affect the registration and the difference between pages; paper alignment in the paper cassette, mechanical components of the printer itself, and imperfections in the paper. Also realize that it is next to impossible to align the pages exactly as they were when they went through the printer.

Also keep in mind that the LaserWriter Select family of printers were not designed for camera-ready artwork. The engine was designed for small business and home use. The transfer roller, for example, has a spring on each side to regulate the tension of the roller against the paper and the toner drum. As the printer operates, there could be a degree of variation from page to page. Also realize that small imperfections in the roller materials which can affect paper travel, as well as the paper alignment in the cassette. The paper, as it lies in the cassette, can be registered differently from one page to the next.

The 1/16-in. degree of registration difference is well within Apple's specifications for this print engine.

QuickDraw GX: No Cover Sheet with Remote Only Install (5/95)

Revised: 6/1/95
Security: Everyone

QuickDraw GX: No Cover Sheet with Remote Only Install (5/95)

=====

Article Created: 31 May 1995

TOPIC -----

I have two Macintosh computers using QuickDraw GX that are connected using EtherTalk. I am trying to use the Fax Sender GX, from the remote computer. I have the full Telecom software installed on one of the computers, the other one I installed the Remote Only option. From the host I can send faxes and cover pages without any problems. But on the remote computer I cannot get the cover page option to display.

DISCUSSION -----

The Telecom User's Guide states that "sending a fax as a network client is no different from sending a fax from your local computer." But what the User's Guide fails to mention is that you must use a complete installation of the Telecom software, not just the Remote Only installation for full functionality. So, you must reinstall the complete telecom software on the remote computer if you want to send cover sheets and faxes from the remote computer.

Fax Terminal: Character Limitation In Notes Field (5/95)

Revised: 5/31/95
Security: Everyone

Fax Terminal: Character Limitation In Notes Field (5/95)

=====

Article Created: 31 May 1995

TOPIC -----

I am using the Express Modem and the Fax Terminal software v7.5 and I am having problems using the notes field. The notes field allows me to enter text into the notes field for a while (about a quarter of the way down), then I get a system beep and characters are no longer entered into the notes field. Why?

DISCUSSION -----

You are running into a limitation of the notes field on the cover page. This field can hold up to 255 characters, which is typically about 5 lines of text.

LaserWriter Bridge: Use 802.2 Frames With SoftWindows (5/95)

Revised: 5/31/95
Security: Everyone

LaserWriter Bridge: Use 802.2 Frames With SoftWindows (5/95)

Article Created: 31 May 1995

TOPIC -----

Is it possible to use SoftWindows and IPX on the Windows side parallel with the LaserWriter Bridge? I cannot access my Novell server when LaserWriter Bridge is on, if I turn it off, I can access the server.

DISCUSSION -----

There is a known issue with LaserWriter Bridge 1.0/2.0.1 and SoftWindows, specifically with trying to access Novell servers while within SoftWindows. It is currently unclear where the problem lies though basically it appears that both products have listener sockets for the 802.3 frame type, and only one is possible. Since LaserWriter Bridge is the first to obtain the socket, SoftWindows is unable to get a socket and the error occurs. The workaround to this situation is to configure the Novell server to utilize 802.2 frame types in addition to 802.3. This way, communications between the Novell server and clients can operate using 802.2.

Here is how to configure the Novell server for 802.2 use:

This goes in the AUTOEXEC.NCF file in addition to the commands already there.

AUTOEXEC.NCF Example:

```
-----  
IPX Internal Net 34BE3556A  
Load NE2000 INT=3 PORT=300 DMA=5 Frame=Ethernet_802.3 Name=Fred  
Load NE2000 INT=3 PORT=300 DMA=5 Frame=Ethernet_802.2 Name=Bob  
Bind IPX to Fred NET=100  
Bind IPX to Bob NET=105
```

All you are doing is adding the 3rd and 5th line to the AUTOEXEC.NCF file. Pretend the other lines (1st, 2nd, and 4th) already exist; they will probably vary with how you have your server configured.

System 7.5: Maximum Number of Items in the Launcher (9/95)

Revised: 9/18/95
Security: Everyone

System 7.5: Maximum Number of Items in the Launcher (9/95)

=====

Article Created: 31 May 1995
Article Reviewed/Updated: 18 September 1995

TOPIC -----

What is the maximum number of items that I can put in the Launcher window under System 7.5?

DISCUSSION -----

The Launcher (v. 2.7) supports a total of eight buttons. If there are aliases in the root level of the Launcher Items folder, then only seven new buttons can be created by naming folders with a bullet (Option-8) as the first character. The Application button is created by default for the 'loose' aliases. However, if there are only folders whose names start with a bullet, then eight custom buttons can be created.

There is a 40 item limit under each of the eight buttons. Additional items do not display, even if they are placed inside the Launcher Items folder in the System Folder.

Article Change History:
18 Sep 1995 - Corrected typo in title.
11 Jul 1995 - Added information about button limit and Launcher version

PowerBook 500: Does Not Come with CloseView Control Panel (5/95)

=====

Article Created: 31 May 1995

TOPIC -----

Do the PowerBook 500 series computers that ship with System 7.1.1 come with the CloseView control panel?

DISCUSSION -----

No. The CloseView control panel does not come with these systems. It is not on the hard drive or the backup disks.

The CloseView control panel does work on these systems, however.

LaserWriter IINTX: Poor Image Quality with Manual Feed (6/95)

Revised: 6/2/95
Security: Everyone

LaserWriter IINTX: Poor Image Quality with Manual Feed (6/95)

=====

Article Created: 2 June 1995

TOPIC -----

I have IINTX printers with Postscript interpreter version 47 and the LaserWriter driver 8.2.2.

When I use manual feed, I encounter poor image quality (it looks like dot matrix) from a variety of CPUs and OS versions. Output from the cassette feed on these printers is okay. What is wrong and why is it only happening with manual feed?

DISCUSSION -----

We were able to duplicate the problem printing to a Laserwriter IINTX with Rev. 1.0 ROMs. The problem has to do with how the version of PostScript in the printer handles graphics. Apple LaserWriter printers with PostScript versions prior to 51.8, such as the LaserWriter IINTX with revision 1 ROMs (PostScript 47) and the LaserWriter IINT (PostScript 47), have been known to experience problems when printing complex graphics.

We tested LaserWriter drivers 7.1.2, 8.2, 8.2.2, and 8.3. All LaserWriter 8 drivers exhibited the same anomaly when printing manual feed documents. The output from Rev. 8.x manual feed documents is noticeably distorted. The Postscript information being sent to the printer is adversely affected by the driver when manual feed is chosen as the paper source.

Workarounds

There are a couple of ways to resolve your issue:

- Switch to the LW 7.1.2 driver.
- Upgrade the Laserwriter to the 3.0 ROMs.

Since the Postscript version contained in your ROMs has been known to exhibit

problems printing graphics, it would be best to upgrade to the current ROM revision and eliminate conflict between the Postscript revision and the Laserwriter driver.

DOS Compatibility Card: All NT Servers Don't Appear (8/95)

Revised: 8/16/95
Security: Everyone

DOS Compatibility Card: All NT Servers Don't Appear (8/95)

=====

Article Created: 1 June 1995
Article Reviewed/Updated: 16 August 1995

TOPIC -----

I am having a problem running Windows for Workgroups (Windows 3.11) on a Power Macintosh with a DOS Compatibility Card installed. The problem is, only 11 of the 30 Windows NT servers show up in the Windows File Manager. I can log into any of the 11 servers listed as network drives, but there are 19 other file servers that are not listed.

I have restarted Windows for Workgroups several times, and on two occasions had four other file servers listed, for a total of fifteen. But I was never able to get all of the servers listed; it was always the same 11, OR the 11 plus the four additional drives. All of the Gateway 2000 computers on the network that run Windows for Workgroups can list all 30 servers.

DISCUSSION -----

Here are possible solutions to the problems you are experiencing. It is important that ALL of the solutions be implemented, as they are all directly related to the proper functioning of the Browser in Windows for Workgroups 3.11. It is important to note that all of this information comes from Microsoft's TechNet CD, so if you will be doing further work with Windows for Workgroups 3.11 and Window NT, you should get a subscription to this resource. Contact Microsoft for subscription information.

Step 1

Make sure the following files have the same or later creation dates. These are the versions you should be using:

Begin_Table

Name	Size	Date

NDIS.386	27,846 Bytes	9/4/94
NET.EXE	450,262 Bytes	9/4/94
NETAPI.DLL	109,120 Bytes	9/4/94
NWNBLINK.386	37,964 Bytes	9/4/94
VNETSUP.386	14,647 Bytes	9/4/94
VREDIR.386	85,746 Bytes	9/4/94

End_Table

NET.EXE should be in the Windows directory, and the rest should be in the WINDOWS\SYSTEM directory. If the files you have are older, contact Microsoft to get the updated files.

Step 2

Make sure you have enough conventional memory -- the Windows for Workgroups 3.11 Browser requires a minimum of 540K of free conventional memory. See the Microsoft DOS documentation for memory optimization techniques.

You need to determine what you will not be using, as far as DOS-Macintosh functionality, and remove those pieces from memory, which is at a premium in the DOS Compatibility Card environment. To increase the amount of conventional memory, you need to remove terminate and stay resident (TSR) application programs. For example, if you are not going to be using the clipboard function, you can remove DOSClip. You may be able to remove other TSRs from your DOS startup.

Step 3

The (Link Driver MACODI) section that should look like this:

```
(Link Driver MACODI)
data=Frame Ethernet_802.3
data=Frame Ethernet_II
data=Frame Ethernet_SNAP
data=Frame Ethernet_802.2
data=Link Driver MACODI
```

Step 4

Remove the (NetBeui) section from the PROTOCOL.INI file. It is not a required protocol for Windows networking and may cause some problems since it cannot be routed.

Step 5

Comment out or remove the following line:

```
TimerCriticalSection=10000
```

in the system.ini file

Step 6

Make sure all NT servers are either version 3.5, or if they are 3.1, that they have the latest service pack from Microsoft installed. Contact Microsoft for additional information on both the upgrade and Service Pack.

Step 7

Comment out the following lines if they appear in your SYSTEM.INI file:

```
InDosPolling=True
TimerCriticalSection=<any value>
V86ModeLanas=<any value>
```

Step 8

If all of the above steps do not work, then add the following line to the (network) section of the SYSTEM.INI file on at least one Windows for Workgroups 3.11 machine in each workgroup:

```
MaintainServerList=yes
```

This will slow the machine down somewhat, but should correct the problem.

Power Macintosh: Bad Disk 3 Image on Install Me First CD (6/95)

Revised: 6/1/95
Security: Everyone

Power Macintosh: Bad Disk 3 Image on Install Me First CD (6/95)

=====

Article Created: 1 June 1995

TOPIC -----

I am using the Apple Macintosh CD SSW version 7.5, CD version 2.0. I have made a set of disks from the disk images on the CD-ROM. However, I cannot successfully get these disks to install System 7.5 on my Macintosh. Every time it reaches the Install 3 disk, the installation fails. If I run the installation from the CD-ROM, it works properly. How do I make a set of functional disks?

DISCUSSION -----

Thank you for your questions about the System 7.5 disk images on version 2.0 of the Power Macintosh CD-ROM. A minor problem was identified with one of the "Disk 3" images on the Power Macintosh CD-ROM. This disk image should be fixed in the next release of this CD-ROM.

Fortunately, there is another Disk 3 image on that CD, which you can use to make a working "Install Disk 3".

Step 1

Insert the Power Macintosh CD, and open the "Disk Images" folder.

Step 2

Open the "System Software" folder. Scroll the window to the bottom.

Step 3

Two new folders appear, called "Disk Set 1", and "Disk Set 2". The corrupt "Install Disk 3.image" file is in the Disk Set 2 folder.

Step 4

Open the "Disk Set 1" folder.

Step 5

Make a new floppy disk from the "Install Disk 3.image" file in this folder.

As an alternative, you can also run the system software installation directly from the CD-ROM. This installation can be found in the "System Software Install" folder.

Macintosh 500 Family: No Nubus Cards Available (6/95)

Revised: 6/1/95
Security: Everyone

Macintosh 500 Family: No Nubus Cards Available (6/95)

=====

Article Created: 1 June 1995

TOPIC -----

Can I install a Nubus card in a Macintosh Performa 550 computer?

DISCUSSION -----

The Macintosh 500 family has a processor direct slot (PDS) for expansion. While Apple does make a Nubus adapter card to allow a Nubus card to be used with the PDS, the design of the Macintosh 500 series does not allow enough room to insert the adapter card.

Macintosh computers the 500 family include:

Macintosh LC 520
Macintosh LC 550
Macintosh LC 575
Macintosh LC 580

Macintosh Performa 550
Macintosh Performa 560
Macintosh Performa 575
Macintosh Performa 577
Macintosh Performa 578

Mac LC 580 & Pwr Mac 5200/75 LC: Optional Video-Out Card (10/95)

Revised: 10/2/95
Security: Everyone

Mac LC 580 & Pwr Mac 5200/75 LC: Optional Video-Out Card (10/95)

Article Created: 1 June 1995
Article Reviewed/Updated: 2 October 1995

TOPIC -----

I want to connect an external monitor to my Macintosh LC 580 or Power Macintosh 5200/75 LC, how do I do this?

DISCUSSION -----

Both the Macintosh LC 580 and Power Macintosh 5200/75 LC can use the optional Apple External Video Connector (M4099LL/A) to provide a video-out source. The Apple External Video Connector plugs into the main logic board, and allows you to connect to a second Macintosh compatible 14-inch display. The external video source mirrors the built-in display. If you need to project the image to a TV or LCD panel, then you need the Apple Presentation System.

The Apple External Video Connector does not use the communications or PDS slot, leaving these slots open for other expansion.

Article Change History:
02 Oct 1995 - Added part number for video card.
28 Jun 1995 - Added Power Macintosh 5200/75 LC.

AppleShare Client for Windows: Truncated File Name (7/95)

Revised: 7/19/95
Security: Everyone

AppleShare Client for Windows: Truncated File Name (7/95)

=====

Article Created: 2 June 1995
Article Reviewed/Updated: 19 July 1995

TOPIC -----

This article describes the truncating of Macintosh file names by AppleShare Client for Windows users.

DISCUSSION -----

The Macintosh Hierarchical File System (HFS) file system uses 31 characters in file names. Also all DOS special characters (except the colon) are valid HFS file name characters.

The AppleShare Client for Windows sees the truncated name, based on the DOS 8.3 file system naming convention. The Windows client implements a file name truncating algorithm, however the real file name is still the long Macintosh file name. This can be viewed in the File Manager's Properties dialog box.

AppleShare Client for Windows: File Size Differences (7/95)

=====

Article Created: 2 June 1995
Article Reviewed/Updated: 19 July 1995

TOPIC -----

This article describes how to find the actual size of a file on both Macintosh and Windows platforms.

DISCUSSION -----

To view the true file size from a Macintosh highlight the file, and choose the Get Info command in the File menu. In the Get Info window, the actual file size is listed in parentheses with bytes used.

To view the amount of AppleShare File Server disk space used for a given file from a Windows client, highlight the desired file, select the Properties item from File Manager, and click on the AppleShare... option. The disk statistic appears in the Size field of this dialog.

The Windows File Manager shows the actual number of bytes of the file. A Macintosh Finder window reports the number of bytes allocated on the disk to store the file.

AppleShare Client for Windows: Losing Resource Forks (7/95)

Revised: 7/19/95
Security: Everyone

AppleShare Client for Windows: Losing Resource Forks (7/95)

=====

Article Created: 2 June 1995
Article Reviewed/Updated: 19 July 1995

TOPIC -----

This article describes how Macintosh resource forks can be damaged when making them visible on Windows clients.

DISCUSSION -----

Macintosh files with resource forks are hidden from a Windows client user to protect them from damage. To view hidden files, select the Views/By File Type menu item in the File Manager and select the Show Hidden/System Files item.

WARNING: Hidden files can be made visible, if these hidden files are modified, they can be permanently destroyed.

Macintosh files copied or moved on the server by a Windows client can lose their icon information, and Macintosh long names because the Windows File Manager does not support these file attributes. The workaround is to open the file within the Macintosh application while icon information can either be replaced by using ResEdit, or pasting the appropriate icon into the Get Info box for the desired file.

Macintosh files where all data is contained in the data fork can be modified, and no data is lost. However like before the Icon appears as a generic icon, and the file name is shortened.

AppleShare Windows Client: Best Routing & Lost Packets (7/95)

=====

Article Created: 2 June 1995
Article Reviewed/Updated: 19 July 1995

TOPIC -----

This article describes a problem with NSI 1.5 installed on AppleShare File Servers when AppleShare Client for Windows PCs transfer large amounts of data.

DISCUSSION -----

The AppleShare Client does not use Best Routing completely. Without Best Routing, a problem may occur which causes the router to pass the returning packet to another router, rather than to the PC workstation. The Network Software Installer (NSI) 1.5.1 installed on the AppleShare server fixes this. Be sure NSI 1.5.1 is installed on the server.

This article was published in the "Information Alley":

AppleShare Client for Windows: Questions & Answers (7/95)

=====

Article Created: 2 June 1995

TOPIC -----

This article provides a brief list of common AppleShare Client for Windows questions and answers.

DISCUSSION -----

Question: What does the error message "Your System is configured with an incompatible network driver" mean?

Answer: Only one AppleTalk stack can be loaded on a workstation. See PROBLEMS.WRI located on installer Disk 1 for step-by-step instructions for removing Farallon's PhoneNet PC.

Question: What does the error message "AppleTalk Driver was not loaded. Please reinstall AppleShare" mean when Windows is starting up?

Answer: This error message is indicative of the following:

- Incorrect NET.CFG parameters
- Conflicting NET.CFG files
- Unsupported NIC
- Computer was not restarted after installation
- The call to ATDRIVER.BAT is located after Windows is executed in the AUTOEXEC.BAT.

Question: Why does the File Manager's Properties button not always show the type and creator?

Answer: The AppleShare Client looks to see if the application used to create the document is on the same volume.

Question: Why do certain applications sometimes crash when saving?

Answer: This occurs when saving documents with applications that have been configured with a different AppleTalk stack like Claris's FileMaker Pro.

Question: Can I Mount a volume on Drive B?

Answer: Yes, AppleShare Client lets you do this, however File Manager does not see any files on this drive. "DIR" from a virtual DOS computer sees the files.

MacTCP and Different Connection Configurations (6/95)

Revised: 6/2/95
Security: Everyone

MacTCP and Different Connection Configurations (6/95)

=====

Article Created: 2 June 1995

TOPIC -----

I have a PowerBook 540c 12/320, with System 7.5, and MacTCP 2.04. I use an Ethernet connection at work and a PPP connection at home. When I was at work the other day, I clicked on the Ethernet icon in the MacTCP control panel to change the addressing configurations, clicked OK, and then checked the PPP configuration.

When I clicked on the PPP icon, the configuration had changed to the EXACT SAME THING as the Ethernet configuration. It's as though the Ethernet configuration just swallows up the PPP configuration. Do you know what is going on?

DISCUSSION -----

MacTCP writes its configuration information to a file in the preferences folder called MacTCP Prep. When you make any kind of change in the MacTCP control panel, it will write that change to the MacTCP Prep file. This can be a problem if you are working with a couple of different configurations.

One work around it to save copies of your MacTCP Prep file and copy in the one you want to use. There is also a program called MacTCP Netswitch written by David Walton of the University of Notre Dame that automates this process. To find MacTCP Netswitch the URL is:

<http://www.nd.edu/~dwalton1/netswitch.html>

Macintosh LC 630 DOS Compatible: Specifications (6/95)

Revised: 6/2/95
Security: Everyone

Macintosh LC 630 DOS Compatible: Specifications (6/95)

=====

Article Created: 2 June 1995

TOPIC -----

This article provides the specifications of the Macintosh LC 630 DOS Compatible computer letting you run Macintosh, DOS, and Windows software.

DISCUSSION -----

Common Features

Seamless Integration Between Mac OS, DOS & Windows

=====

Integration

- Run Mac OS and DOS or Windows software simultaneously
 - applications, games and CD-ROM titles
- Toggle between operating systems with a keystroke
 - single monitor supports both
- Copy & paste between OS environments
- Easily share files and folders
- Use Mac compatible printer and peripherals with both operating systems
- Supports Apple monitors (High Resolution RGB up to Multiple Scan 15) or VGA and SVGA monitors

Storage

- 1.4 MB Apple SuperDrive floppy
 - Read and write Mac OS, MS-DOS, OS/2 and ProDOS disks
- 500 MB IDE hard drive, 1/3 height
 - PC files reside in virtual drive container
- Double-speed CD-ROM drive

Power, Size and Other

- Front headphone jack

- Front controls for volume
- Infrared remote control
- 110 - 240v, 50 - 60 Hz
- Power on/off from keyboard
- 12.6"x16.5"x4.3" (320mm x 419mm x 109mm)
- 19 pounds (8.6 kg)

Options

Work with Mac OS, DOS and Windows

- CommSlot Ethernet card
 - 10 BASE-T, thin, thick, AAUI
- Modem
- Apple Presentation System

Macintosh Features Advanced Multimedia

=====

Processor & RAM

- 68LC040 running at 66/33 MHz
- 8 MB RAM standard
 - 4 MB on logic board, 4 MB in SIMM
 - Expandable up to 52 MB (32 MB in one SIMM, 16 MB in other)
 - Two 72-pin SIMM sockets
 - Expand single SIMM at a time
 - 80 ns or faster
- 1 MB ROM

Expansion & Ports

- Video-in slot (Optional)
- TV tuner slot (Optional)
- Communications slot
- SCSI, two serial, ADB, sound-in, sound-out

Video

- 1 MB DRAM video frame buffer
- 16-bit color at 640x480, 8-bit color at 800x600, 832x624
- Supports video in a window with optional card

Sound

- 16-bit CD audio, 8-bit sound

Software

- Mac OS System 7.5 with Apple Guide, AppleScript and PC Exchange included

DOS/Windows Features

Hardware-based Compatibility

=====

Processor & RAM

- 486 DX/2 running at 66 MHz
- 4 MB RAM standard on SIMM
 - Expand up to 32 MB
 - One 72-pin SIMM socket
 - 80 ns or faster

Networking

- Included ODI driver supports Novell NetWare IPX and TCP/IP protocols

Sound

- SoundBlaster 16 compatible audio out

Ports

- Joystick (DB-15)
- Serial ports emulate PC serial interface (COM1, COM2)
- Printer port emulates parallel port (LPT1) supporting PostScript, Epson and HP PCL-style printer drivers

Video

- 512K DRAM video frame buffer
- 8-bit color at 640x480
 - 4-bit color at 800x600
- Supports VGA, SVGA, EGA, CGA standards

Software

- DOS 6.22 and Windows 3.1 included

Color StyleWriter 2200: Description (6/95)

Revised: 6/16/95
Security: Everyone

Color StyleWriter 2200: Description (6/95)

Article Created: 5 June 1995

TOPIC -----

This article contains the product description for the Apple Color StyleWriter 2200 printer.

DISCUSSION -----

The Apple Color StyleWriter 2200 is the perfect PowerBook companion for professionals on the go. This innovative ink-jet printer combines outstanding performance for both color and black-and-white printing with true portability—so being on the road doesn't have to mean accepting a compromise in print quality.

Even if your travel is only from one desktop Mac OS system to another, the very portable Color StyleWriter 2200 is the perfect way to add color printing capability to all of your work sites at once. Weighing in at only 3 pounds and featuring a compact design that lets it fit into a standard briefcase, the Color StyleWriter 2200 is anything but small when it comes to features. It offers impressive 360 by 360 dot-per-inch resolution for color printing—and even higher resolution for printing in black and white. The speed of the Apple Color StyleWriter 2200 is also impressive: It prints up to 5 pages per minute in black and white and up to 0.33 page per minute in color.

Speaking of color, through its integrated ColorSync 2.0 software, the Color StyleWriter 2200 provides superior color matching from screen to printed output. In addition, its water-resistant ink means that you can walk away and work on something else—confident that your vital report, proposal, or presentation won't run or smear. It even features convenient, flexible paper handling, offering a built-in 30-sheet feeder that can handle not only standard paper, but also printed envelopes, transparencies, and more.

So, if you're looking for desktop-level performance and quality in a truly portable printer, the Apple Color StyleWriter 2200 is the printer for you.

Features

=====

Outstanding Print Quality

- Prints extremely high resolution documents by smoothing the edges of text and line art using 720- by 360-dpi resolution for crisp black-and-white pages; prints pages containing color or gray-scale images at 360-by 360-dpi resolution
- Uses its four-color printing capability to allow millions of colors, plus true black, on the same page
- Takes advantage of ColorSync 2.0 color-matching technology to ensure accurate color matching from screen to printer
- Offers a choice of 64 scalable TrueType fonts for printing in any size and in a wide range of styles High performance
- Prints up to 5 pages per minute for black and white and a full-color page in less than 3 minutes
- Takes advantage of the high performance of PowerPC processor-based computers to speed the processing and printing of complex documents

Convenience

- Is designed to be truly portable—weighs just over 3 pounds and fits into a standard briefcase
- Features an extremely compact, attractive design that complements the design of PowerBook computers
- Includes everything needed to print: interface cable, color ink cartridge, ink tanks, and cartridge storage case
- Prints on a wide range of media, including plain paper and envelopes for economical output and a variety of specialty media, including transparencies, coated paper, and back-print film
- Complies with the EPA's Energy Star guidelines for energy-efficient operation
- Provides "desktop printing"; lets you print files by simply dragging them onto a desktop printer icon
- Allows you to place watermarks in the background of your documents quickly and easily
- Lets you print two or four reduced-size pages on a single sheet of paper for fast and easy document review

DISCUSSION -----

Technical Specifications
=====

Print Method

Thermal ink jet

Print Quality

- 360 by 360 dpi for color or gray-scale documents
- 720 by 360 dpi for edge smoothing on black-and-white documents

Interface

High-speed serial (885 Kbps)

Speed

- Up to 5 pages per minute for black and white
- Up to 0.33 page per minute for color
- Actual speed depends on the documents printed and the Macintosh used

Fonts

- TrueType font support (see below for the 64 TrueType fonts available)
- Adobe PostScript font support when used with Adobe Type Manager software

Fonts Available

Ink Cartridges and Tanks

- Color Ink Cartridge (includes print head, color ink tank [cyan, magenta, and yellow], and black ink tank). Print head prints approx. 2,000 pages.
- Ink tanks print approx. 40 pages @ 30% ink cover-age (7.5% ink coverage for each of the four colors).
- High-Performance Black Ink Cartridge (includes print head and black ink tank). Print head prints approx. 3,000 pages. Ink tank prints approx. 150 pages @ 5% ink coverage.
- Actual page print capacity per ink tank depends on the documents printed and type of print material used.

Print Materials

- 16- to 24-lb. (60 to 90 g/m²) bond or copier paper

Paper

U.S. letter, U.S. legal, A4, executive, and envelopes (#10 business and #6)

- Most letterhead and colored stock, labels, and envelopes
- For superior graphics and imaging results, Apple recommends Apple glossy and premium paper and Apple back-print film
- For fast dry time and vibrant colors on overhead transparencies, Apple recommends Apple color ink-jet transparencies

Paper Capacity

- Built-in automatic paper feeder tray holds up to 30 sheets of plain paper, 8 sheets of specialty media, or 5 envelopes

Printable surface

- Maximum printable line: 8.1 in. (20.6 cm)
- Minimum margins: 0.2 in. (0.5 cm) left and right;

. 0.1 in. (0.3 cm) top; 0.3 in. (0.8 cm) bottom

Size and Weight

- Height: 2.2 in. (5.7 cm)
- Width: 11.8 in. (30.0 cm)
- Depth: 6.2 in. (15.8 cm)
- Weight: 3.1 lb. (1.4 kg)

Power

- AC power adapter or optional NiMH (nickel-metal hydride) rechargeable battery (prints approximately 200 pages per charge)

Operating Environment

- Temperature: 59° to 86° F (15° to 30° C)
- Humidity: 10% to 80% noncondensing

System requirements

- Any Apple Macintosh or PowerBook computer with at least a 68020 processor, or any Power Macintosh
- 4MB RAM or more
- System software version 7.1 or later
- Supports QuickDraw GX
- Supports ColorSync 2.0

Ordering Information

=====

Apple Color StyleWriter 2200

Order No. M3474LL/A

- Apple Color StyleWriter 2200 printer
- User's guide
- Apple Peripheral-8 Cable
- Color StyleWriter 2200 Color Ink Cartridge (includes print head, color ink tank [cyan, magenta, and yellow], and black ink tank)
- Color StyleWriter 2200 Black Ink Cartridge (includes black ink tank)
- Ink Cartridge Storage Case
- AC power adapter
- Driver software disks
- Limited warranty

Ink cartridges

- Color Ink Cartridge: M3908G/A
- High-Performance Black Ink Cartridge: M3909G/A

Replacement Ink Tanks

- Color Ink Tank: M3911G/A
- Black Ink Tank (for Color Ink Cartridge): M3912G/A
- Black Ink Tank (for High-Performance Black Ink Catridge): M3910G/A

Media

Letter-size transparency: M2658G/A
Letter-size premium paper: M2952G/A
Letter-size glossy paper: M3655G/A
Letter-size back-print film: M2953G/A
A4-size transparency: M1959G/A
A4-size premium paper: M2951G/A
A4-size glossy paper: M3656G/A

AppleCD: Designed For Horizontal Operation (6/95)

=====

Article Created: 5 June 1995

TOPIC -----

Will the AppleCD 300 or AppleCD 600 drives operate on their sides? I am not able to get it to work on its side.

DISCUSSION -----

Although you may have been successful in getting the AppleCD 300 and 600 to operate on its side, these mechanisms were not designed, tested, nor intended to be operated in the vertical orientation and therefore operating the drives in this position is not supported by Apple.

Drive Setup 1.0.x: Frequently Asked Questions (12/95)

Revised: 12/20/96
Security: Everyone

Drive Setup 1.0.x: Frequently Asked Questions (12/95)

=====

Article Created: 5 June 1995
Article Reviewed/Updated: 11 December 1995

TOPIC -----

This article contains Frequently Asked Questions (FAQ) regarding the Drive Setup 1.0.x utility that ships with Power Macintosh models that use System 7.5.2 and is also available online.

Questions answered in this FAQ:
=====

- 1) With large volume support features, what is the maximum number of Macintosh HFS partitions that can be created on a single device?
- 2) The documentation for Drive Setup says that third-party hard drives are not supported. However, Drive Setup does support some third-party removable cartridge drives. Does this mean that if you have a third-party hard drive installed in your system, that Drive Setup will not see it? If it does see it, will all of the functions work? What about 3rd-party flavors of some of the drive mechanisms that we support?
- 3) Can you have a System Folder on each partition of a hard drive that has been formatted with Drive Setup? Can you boot from each of these partitions? Is this a 'supported' configuration?
- 4) How do each of the various options I can choose affect the way the hard drive is formatted? What are each of the features actually doing?
- 5) What's the difference between Drive Setup shipped with 7.5.2 and HDSC shipped with 7.5?

DISCUSSION -----

- 1) Question: With large volume support features, what is the maximum number of Macintosh HFS partitions that can be created on a single device?

Answer: The maximum number of partitions is always eight (8). It does not depend on the capacity of the device.

2) Question: The documentation for Drive Setup says that third-party hard drives are not supported. However, Drive Setup does support some third-party removable cartridge drives. Does this mean that if you have a third-party hard drive installed in your system, that Drive Setup will not see it? If it does see it, will all of the functions work? What about 3rd-party flavors of some of the drive mechanisms that we support?

Answer: Drive Setup only supports qualified Apple hard drives and some removable devices as listed in the Drive Setup Guide file. Unsupported hard drives will show up in the device list by name, however, if you select an unsupported hard drive you will get the message, "Cannot modify a disk in an unsupported drive."

When using this utility, it is possible to receive the message, "Unrecognized driver." This message means that the selected device is an Apple hard drive, but that it is currently using a third-party driver.

3) Question: Can you have a System Folder on each partition of a hard drive that has been formatted with Drive Setup? Can you boot from each of these partitions? Is this a 'supported' configuration?

Answer: Yes, this is a supported configuration. After using Drive Setup to partition your hard drive, you can put a System Folder on any (or all) of the hard drive's partitions. After putting a System Folder on a partition, use the "Startup Disk" control panel to select that partition as the startup volume.

4) Question: How do each of the various options I can choose affect the way the hard drive is formatted? What are each of the features actually doing?

Answer: There are four types of initialization with Apple's Drive Setup utility. They are:

i. Regular Initialization

A regular initialization erases the data on the disk and makes all the space on the disk available for use. Regular initialization is recommended for most disks. It is not necessary to initialize a new hard disk, since hard disks are factory-initialized.

ii. Low-level Format

A Low-level format erases all data from the disk plus any information about the disk's file structure and other structures. Since hard disks are factory-formatted, it is not necessary or recommended to do a low-level format for a hard disk. Users may choose to perform a low-level format on some hard disks older than five years since these hard disks may not have been formatted since the release of System 7.

iii. Initialization with the "zero all data" option

..TIL17850-Drive_Setup_1-0-x-Frequently_Asked_Questions_12-95.pdf

A regular initialization erases all data, but under certain conditions the data can be retrieved. If, for security purposes, you wish to be certain that the data can never be retrieved, this option replaces the data with a series of zeros so the data is overwritten and truly removed from the hard drive.

iv. Initializing using both the low-level and the "zero all data" options
This combines options 2 and 3 mentioned above. Both of these options will increase the time it will take to initialize a disk.

5) Question:: What's the difference between Drive Setup shipped with 7.5.2 and HDSC shipped with 7.5?

Answer: Drive Setup 1.0.x allows you to initialize, partition and test both SCSI and IDE hard disks. Apple HD SC Setup 7.3.5 allows user to initialize, partition and test SCSI hard drives only. Drive Setup 1.0.x allows users to set different initialization options for both SCSI and IDE hard disks, while Apple HD SC Setup 7.3.5 gives only one initialization option for SCSI hard disks.

These articles can help you locate the software update, Drive Setup 1.0.3, mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

TOPIC -----

I want to use the Multiple Scan 15 Display on a PC compatible computer. The Multiple Scan 17 Display ships with a PC adapter, but not the Multiple Scan 15 Display. Is the Multiple Scan 17 Display adapter compatible with the Multiple Scan 15 Display?

DISCUSSION -----

Yes, the PC Adapter from the Multiple Scan 17 Display is compatible.

You need purchase the PC Adapter as a service part from an Apple reseller. The PC adapter is service part number 922-0736.

The Tech Info Library article "Multiple Scan 15 Display: Technical Specifications" contains additional information on video resolutions supported by the Multiple Scan 15 Display.

Article Change History:
11 Sep 1996 - Clarified the discussion, changed distribution.

LaserWriter PostScript Fax: Needs QuickDraw GX Helper (6/95)

Revised: 6/5/95
Security: Everyone

LaserWriter PostScript Fax: Needs QuickDraw GX Helper (6/95)

=====

Article Created: 5 June 1995

TOPIC -----

I am using QuickDraw GX 1.1.2 but have had to turn it off in order to use the PostScript fax card option in my printer. Is there any other way around this?

DISCUSSION -----

If you custom install QuickDraw GX Helper you can use the LaserWriter 8f driver by turning OFF Desktop Printing (ONLY works with non GX-saavy applications). Here is a quick procedure for setting it up:

Step 1

Before installing QuickDraw GX Helper, make sure that the only LaserWriter extension in the Extensions folder is LaserWriter 8f. If others are installed, then GX Helper defaults to those first.

Step 2

Select LaserWriter 8f in the Chooser and click "Setup" on the desired printer; this selects the correct PPD.

Step 3

Install GX Helper by doing a custom install for GX, and then restart your Macintosh computer.

Step 4

Once the system is up, launch the desired non-QuickDraw GX aware application and select "Turn off desktop printing" from the Apple menu. A dialog appears

stating that LaserWriter 8f will be used instead.

Apple Internal HD Format: Version History (9/95)

Revised: 9/21/95
Security: Everyone

Apple Internal HD Format: Version History (9/95)

=====

Article Created: 5 June 1995
Article Reviewed/Updated: 21 September 1995

TOPIC -----

Could you please detail the difference between each of the versions of Internal HD Format that Apple has released, including which machine each has shipped with?

Does the version 1.3 of Internal HD Format have any additional benefits for Macintosh 630 family computers?

The following computers are in the Macintosh 630 family: Performa 630, Performa 635, Performa 636, Performa 637, Performa 638, LC 630, and Quadra 630.

DISCUSSION -----

Internal HD Format History
=====

The Internal HD Format utility ships with Macintosh computers that have an internal IDE drive. The first Macintosh computers to include an internal IDE drive were the PowerBook 150 and the LC/Quadra/Performa systems.

The version history is as follows:

- 1.0 - Initial release for the PowerBook 150
- 1.1 - Released with the LC/Quadra/Performa 630
 - Updated version string information to reflect System Software 7.1.2 and File Version 1.1
- 1.2 - Never officially released
 - Never released because the version string information was changed incorrectly.

1.3 - Released with the Performa 5200/Power Macintosh 5200/75 LC
. • Updated version string information to reflect System Software
. 7.5.1 and File Version 1.3

NOTE: Later versions of the Performa and Power Macintosh 5200/6200 computers had a new formatting scheme that Internal HD format was unable to read or initialize. Drive Setup 1.0.2 is the supported formatting software for these IDE hard drive equipped computers. Use the search string 'hd format and drive setup' to locate the TIL article "Internal HD Format: Cannot See IDE Drives" for additional information.

Functionally, the Internal HD Format utility versions 1.0 through 1.3 are the same. There is no benefit to using 1.3 over 1.1 or 1.0. Macintosh Users with internal Apple IDE hard drives may use any of the above versions.

Article Change History:

21 Sep 1995 - Added information on using Drive Setup for later Performas.

At Ease 2.0.3 for WG: Searching for At Ease Server (8/95)

Revised: 8/14/95
Security: Everyone

At Ease 2.0.3 for WG: Searching for At Ease Server (8/95)

=====

Article Created: 5 June 1995
Article Reviewed/Updated: 14 August 1995

TOPIC -----

I have At Ease for WorkGroups, and this morning all the workstations have the following message on the screen, "Searching for the At Ease Server volume". I can see the server in the Chooser on the workstations when they're in the Finder, but At Ease doesn't see it. How do I fix this?

DISCUSSION -----

You should follow the steps below to resolve your problem:

- 1) Set the At Ease Disk to be the startup volume
- 2) Restart
- 3) Reset the At Ease Disk to be the server
- 4) Restart and verified that the computer is using the server
- 5) Updated all the other computers on the network
- 6) Ran At Ease Setup on each computer to use the new preferences file

At Ease 2.0.3 for WG: Lock Hard Disk & Driver Software (8/95)

Revised: 8/14/95
Security: Everyone

At Ease 2.0.3 for WG: Lock Hard Disk & Driver Software (8/95)

=====

Article Created: 5 June 1995
Article Reviewed/Updated: 14 August 1995

TOPIC -----

To lock a hard drive within At Ease for Workgroups v2.03 the hard drive must be formatted with formatting software compatible with At Ease. The manual does not list which format software is compatible. Which format software can be used?

DISCUSSION -----

The formatting software known to be compatible is Apple HD SC Setup and Drive7. Many others do work but engineering does not have a list of compatible formatters.

At Ease will provide immediate feedback on whether a specific drive is compatible or not. If At Ease detects an incompatible hard disk, the Lock Startup Volume checkbox is dimmed. You will need to contact the publisher of the driver software to see if a compatible version is available.

Here is some information from the At Ease 2.0.3 Read Me:

Locking the startup disk

When you choose this option, At Ease locks your startup disk by installing security software on it. This security software cannot be installed on hard disks that have been initialized by driver software that is not compatible with At Ease 2.0.3 for Workgroups.

If At Ease detects an incompatible hard disk, the Lock Startup Volume checkbox is dimmed. Contact the publisher of the driver software to see if a compatible version is available. The At Ease security software cannot be installed on any hard disk partitioned with A/UX.

- Updating disk drivers
- If you need to update the driver software for a locked disk, first choose

Security from the Options menu in the Setup program and click the Lock Startup Volume checkbox to remove the X.

- Changing the startup disk

If you lock the startup volume, do not change the startup disk selected in the Startup Disk control panel. If you change the startup disk, your At Ease startup volume will not appear on the desktop when you restart the computer, and you will not be able to reselect it from within the Startup Disk control panel.

Macintosh Scrapbook File: Maximum Size (7/95)

Revised: 7/27/95
Security: Everyone

Macintosh Scrapbook File: Maximum Size (7/95)

=====

Article Created: 5 June 1995
Article Reviewed/Updated: 27 July 1995

TOPIC -----

What is the maximum size of the Macintosh Scrapbook file?

DISCUSSION -----

The Scrapbook, located in the Apple Menu, has a maximum limit of 255 items. The Scrapbook stores items as resources in the resource fork. All Macintosh resource files have a maximum limit of 2727 resources, however the Scrapbook was designed to hold a maximum of 255 resources.

In addition to only being able to store 255 resources, there is a maximum size limit of the combined resources. The total combined resources of the Scrapbook cannot exceed 16 MB. This limit of 16 MB on the resource fork of a file is a Macintosh Hierarchical File System standard, so it applies to all files, not just the Scrapbook.

Power Macintosh 6100 DOS Compatible & Attachmate GW (6/95)

Revised: 6/5/95
Security: Everyone

Power Macintosh 6100 DOS Compatible & Attachmate GW (6/95)

=====

Article Created: 5 June 1995

TOPIC -----

I need to know if there are any issues between a Power Macintosh 6100 DOS Compatible computer and an Attachmate Gateway. I'm involved in a joint project which requires access to a Gupta server through an Attachmate gateway. We are using Windows 3.1 with IBM's LAN Support Program v1.38.

An NDIS driver is required. Everything appears to load OK, with no visual errors - LSL, MACODI, ODINSUP, NETBIND, and so on.

We have reviewed relative files (CONFIG.SYS, AUTOEXEC.BAT, NET.CFG) and verified there are no obvious flaws. (4 frame types active (802.3, 802.2, SNAP & II), Buffers 8, 1600, Mempool 4096.)

When running an Attachmate terminal session or the Gupta workstation software an error occurs indicating the gateway cannot be found (errors 510 & 598 during the terminal session). It almost appears that the ODINSUP shim is not working as a true NDIS driver.

Do you have any idea on what is wrong, and what can be done to make this work?

DISCUSSION -----

Attachmate has determined there is a timing related issue with LSL and MACODI when working with their gateway products. It is important to note that this issue is not specific to the MACODI driver, as Attachmate has reported problems with 3Com, Asanté, and Shiva products to name a few. The actual problem is that MACODI is calling an API synchronously, and when it receives no answer, it stays hung. This is a very simplified version of the problem. Suffice it to say a change is needed to solve the problem, we have no time line for any changes. In the meantime, it has been determined that Novell's SAA Gateway product works fine, so that may be an option.

Here is the technical summary of the problem:

The problem occurs when the synchronous call, `Get_local_target`, is issued by `IPXODI`. This call generates a RIP request packet on the network. The call is issued in response to a `SPX_Establish` connection being sent from the gateway. Since the call is entered synchronously, meaning no other interrupts should be processed until the call completes, the session appears to hang since the call does not complete. The reason the call does not complete seems to be an issue with how the `MACODI.COM` driver handles reentrancy. An ESR, Event Service Routine, is normally entered with interrupts disabled, however once an `IPXSendPacket` is sent down to the LSL the LSL will re-enable interrupts allowing reentrancy into any ESR that called `IPXSendPacket`. The two main ways to protect an ESR from this is to provide a stack for the exclusive use of the ESR or to provide a reentrancy queue.

WiggleWorks: Reading Style and Documentation Error (6/95)

Revised: 6/5/95
Security: Everyone

WiggleWorks: Reading Style and Documentation Error (6/95)

=====

Article Created: 5 June 1995

TOPIC -----

There is a feature in WiggleWorks for changing the pace of the Reading Style. In the manual where changes to settings made through the parent menu are described, it refers to this as the read-aloud pace. It should state it as the READ pace. The setting only affects the Read pace for the READ Button.

DISCUSSION -----

Within WiggleWorks when a book is selected, the user is presented with two read buttons. One is labeled READ-ALOUD, where the program reads the text aloud and highlights text as it does so. The other is labeled READ, where the children can read the text on their own or have it read to them.

The READ-ALOUD option is pre-programmed with reading style and voice. Changes to the Reading style do not affect the READ-ALOUD option. The changes to the reading style ONLY affect the Read Button. A change to reading style can be made by the user during the current run of the program. If a parent or teacher wants the change to the reading style to be permanent they must go through the Parent menu.

Token Ring NB/c and 4/16 NB Cards: Description and Specs (6/95)

Revised: 6/6/95
Security: Everyone

Token Ring NB/c and 4/16 NB Cards: Description and Specs (6/95)

=====

Article Created: 6 June 1995

TOPIC -----

This article provides the description and specifications for the Apple Token Ring NB/c Card and Apple Token Ring 4/16 NB Card.

DISCUSSION -----

The Apple Token Ring NB Cards (Apple Token Ring NB/c and Apple Token Ring 4/16 NB Card) provide Macintosh, Apple Workgroup Server, and Power Macintosh models equipped with a NuBus slot with the ideal Token Ring connectivity solution for all of your networking needs. They support a wide range of protocols including AppleTalk, TCP/IP, and IPX.

The Apple Token Ring NB/c Card is a compact (7-inch) network-interface card that provides exceptional performance at a highly affordable price. This card offers a cost-effective, flexible Token Ring solution for connecting Macintosh computers to Apple Workgroup Servers and mainframes, providing access to a variety of network services such as mainframe connections, electronic mail, data bases, and file and print services.

Benefiting from the same high performance network software, the Apple Token Ring 4/16 NB Card is a full size (12-inch) bus-master network interface card designed for any Macintosh computer with a NuBus slot. It includes its own microprocessor and operating system, allowing it to operate independently of the main Macintosh processor. This mode of operation is designed to support "gateway-style" SNA solutions such as SNA•ps 3270 and SNA•ps 5250, as well as a variety of third-party APPC products.

Both cards use the IBM Token Ring chip set, ensuring compatibility and interoperability with all IBM Token Ring networks. Combining the flexibility of a Power Macintosh with any one of these Token Ring cards and Insignia Solutions SoftWindows DOS/Windows emulation software, users get a seamlessly integrated cross-platform solution to all their application and network needs.

Features

=====

Ease of Use

- Install quickly and easily in a single step
- Ships with multilingual software, which makes it ready for use with different language version of the system software

Compatibility

- Works with all Macintosh models with a NuBus slot, including all Macintosh II, Macintosh Centris, Macintosh Quadra, and Workgroup Server models (except the Workgroup Server 95), as well as with the Power Macintosh line
- Complies with IEEE 802.5 and 802.2 standards
- Uses the IBM Token Ring chip set, which provides complete compatibility with IBM environments
- Supports a variety of popular networking protocols and software, including AppleTalk, TCP/IP, IPX, Apple Internet Router, Insignia Solution's SoftWindows, and SNA•ps 3270 and SNA•ps 5250 client software; the Apple Token Ring 4/16 NB Card also supports APPC and SNA environments through the SNA•ps 3270 and 5250 Gateway.
- Easily integrates into multi-vendor environments
- Adapts to any standard Token Ring cabling environment

High Performance

- Allows concurrent execution of multiple networking protocols to optimize network performance
- Ships with new, re-engineered, high performance network software
- Can be used in configurations ranging from an individual card in a single system to multiple-card, server based configurations

Convenience

- Makes it easy to create, expand, administer, and troubleshoot your network

Apple Token Ring NB/c Card Technical Specifications

=====

Connector

- DB-9 connector for attaching to IBM Type 1 cabling

Transmit/receive data rate

- 4- or 16-megabit per second maximum data rate

Token Ring controller

- IBM Token Ring 9314

Power dissipation

- Maximum 5 W, average 3.5 W

Environmental requirements

- Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- Humidity: 20% to 95% noncondensing

System requirements

- One available NuBus slot or 7-inch expansion slot (requires NuBus adapter)
- IBM Type 1 cabling (shielded twisted pair) or IBM Type 3 cabling (unshielded twisted pair) with use of an external adapter
- Industry standard Token Ring Multistation Access Unit (MAU)

Apple Token Ring 4/16 NB Card Technical Specifications

=====

Connector

- DB-9 connector for attaching to IBM Type 1 cabling

Transmit/receive data rate

- 4- or 16-megabit per second maximum data rate

Processor

- Motorola 68000 operating at 10MHz

Memory

- 512K of RAM, expandable to 2.5 MB

Token Ring controller

- IBM Token Ring 9314

Power dissipation

- Maximum 6 W, average 4 W

Environmental requirements

- Operating temperature: 50 to 104 degrees F (10 to 40 degrees C)
- Humidity: 20% to 95% noncondensing

System requirements

- One available NuBus slot
- IBM Type 1 cabling (shielded twisted pair) or IBM Type 3 cabling (unshielded twisted pair) with use of an external adapter
- Industry standard Token Ring Multistation Access Unit (MAU)

Ordering Information

=====

Apple Token Ring NB/c Card

Order No. M1769Z/A

DOS Compatibility Card: List of Available Expansion Slots (6/95)

Article Created: 6 June 1995

TOPIC -----

This article contains a list of available expansion slots on Macintosh computers with a DOS Compatibility Card installed.

DISCUSSION -----

Slots Available

=====

Computer	Slots available
-----	-----
Quadra 610 DOS Compatible	RAM SIMM Slots (2)
Power Macintosh 6100 DOS Compatible	RAM SIMM Slots (2)
.	Cache Card Slot
Macintosh LC 630 DOS Compatible	RAM SIMM Slots (2)
.	Communication Slot
.	Video (AV/TV) Slot

Slots Unavailable

=====

Computer	Slots Unavailable
-----	-----
Macintosh Quadra 610 DOS Compatible	Processor Direct Slot (PDS)
Power Macintosh 6100 DOS Compatible	Processor Direct Slot (PDS)
Macintosh LC 630 DOS Compatible	Processor Direct Slot (PDS)

Follow upgrades and expansion cards are not available as a result:

- Apple Macintosh LC Ethernet Card
- Apple Macintosh LC Thin Coax Card
- Apple Macintosh LC Twisted Pair Card
- Apple Power Macintosh Upgrade Card
- Apple AV Card for Power Macintosh
- Apple IIe Card
- Nubus Adaptors for Quadra/Centris 610, and Power Macintosh or Macintosh Performa 6100 series computer.
- Any Nubus card that would require using a PDS NuBus adapter.

The following computers are in the Macintosh Performa 6100 series: Performa 6110, Performa 6112, Performa 6115, Performa 6117, and Performa 6118.

Color LaserWriter 12/600 PS: Preventing Toner on Paper (7/95)

Revised: 7/19/95
Security: Everyone

Color LaserWriter 12/600 PS: Preventing Toner on Paper (7/95)

=====

Article Created: 6 June 1995
Article Reviewed/Updated: 19 July 1995

TOPIC -----

I have an Apple Color LaserWriter 12/600 PS, and I am getting small amounts of toner on the printed page. What can I do to prevent it?

DISCUSSION -----

Cleaning the excess toner from the following areas should eliminate the problem:

- Clean density sensor and separation discharge wire with the brush provided. This procedure is described on page 223 of the user's guide.
- Clean the paper pickup area as described on page 226 of the user's guide.
- Printing 10 blank pages will help clean toner off rollers.

Color LaserWriter 12/600 PS: What the BEST Mode Does (7/95)

Revised: 7/19/95
Security: Everyone

Color LaserWriter 12/600 PS: What the BEST Mode Does (7/95)

=====

Article Created: 6 June 1995

TOPIC -----

I have an Apple Color LaserWriter 12/600 PS, and want to know what the BEST print quality selection does for the printer?

DISCUSSION -----

Selection of the BEST mode changes the initial paper path from four rotations to five rotations of the transfer drum. This additional rotation allows the paper to fully adhere to the transfer drum before any transfer of the image to the paper takes place. This corrects small registration problems that occur during the imaging of the first color (magenta).

Color LaserWriter 12/600 PS: Cause of Banding (10/96)

Revised: 10/23/96
Security: Everyone

Color LaserWriter 12/600 PS: Cause of Banding (10/96)

Article Created: 6 June 1995
Article Reviewed/Updated: 23 October 1996

TOPIC -----

When I print from Color LaserWriter 12/600 PS, I can see banding. What causes banding?

DISCUSSION -----

Banding is very difficult to measure with instruments, but the human eye is very good at discerning it. With the Color LaserWriter 12/600 PS or the Color LaserWriter 12/660 PS printer it can arise from a number of areas. These include software, image development area, high voltage power, and basic mechanical factors.

Software
=====

One cause of banding is when applications generate colors that do not exist in the printer colorspace*. When this happens, substitute colors are placed next to colors the printer does not have. Some software applications can read the output devices' colorspace, so they will warn you if you are selecting a color outside the colorspace of the device. Unfortunately at time, only a limited number of applications can do this, most will not warn you if you chose a color outside the colorspace of the device.

* Colorspace: The term for the range of colors a device can produce. In general, a monitor has a larger colorspace than a printer.

You will see the banding effect with artwork where blends are used since the colors are adjacent to each other. Images that use a lot of shading, such as photographs, also make this effect more apparent.

A "stepping" effect, which can be confused as banding, can be caused by blends where not enough steps are sent to the printer. If the artwork is created with

large gaps between color gradations, blends will develop. Some programs automatically generate the number of steps that should exist between the two colors. Changing this value is not recommended, even if it decreases the file size. As a general rule, 256 steps should minimize the effect when blending between two solid primary colors.

The best way to test for banding problems, is to use the test print function on the Color LaserWriter 16/600 PS control panel on the back of the printer.

How To Create A Test Page On The Color LaserWriter

=====

Test Page Pattern Selection

This feature allows you to select one of six test page patterns based upon which pattern would best confirm a print quality issue. Test pattern selection is non-persistent, and after restarting, the test page reverts to the vertical line pattern.

Step 1

Hold down the COLOR SELECT button and press the ENTER button eight times. The four toner lights flash to indicate that you are in the test pattern selection mode.

Step 2

Using the plus or minus buttons, advance the density gauge to illuminate the LED corresponding to the desired pattern. The density gauge flashes when the selected setting differs from the previously entered setting.

NOTE:

Only LEDs 4 through 9 on the density gauge correspond to available patterns.

Step 3

Press the TEST PAGE button to choose the desired test pattern.

Note:

You can press the TEST PAGE button before or after pressing the ENTER button.

Step 4

Press the ENTER button to engage the setting. If you make no further adjustments, the panel exits from the test pattern selection mode in 30 seconds.

Usage Tips

Once the printer has entered the Energy Saving Mode, a test page is no longer produced, and you must restart the printer in order to print additional test pages. You can either use the printer utility, or cycle the power switch to

restart the printer.

Hardware

=====

The engine manufacturer and Apple have worked very hard to minimize the banding. No band that repeats on the page should be greater than 2mm in width. To evaluate the banding print out large vertical solid areas of each color (CMYK) at about 60% coverage, from an application. Look at each and determine if one color is banding worse than the other colors.

NOTE:

The human eye does not detect banding in yellow, so do not expect to see it there.

You should expect to see small bands of variations because of mechanical factors. If there are predominate bands about 50mm apart in any one color it is likely the developer roller in the toner cartridge is causing the banding. If the predominate bands are spaced 38mm or 129mm the cause is likely the Photoconductor cartridge. For additional details on photoconductor banding see the Tech Info Library article titled "Color LW 12/600 PS: Image Defects at Regular Intervals".

Color LaserWriter 12/600 PS: Description (7/95)

Article Created: 6 June 1995
Article Reviewed/Updated: 19 July 1995

TOPIC -----

This article contains a description of the Apple Color LaserWriter 12/600 PS printer.

DISCUSSION -----

Features
=====

Breakthrough Print Quality -----

- Offers True 600-dpi resolution for sharp text and graphics
- Provides superior color print quality, as well as high-quality black-and-white printing
- Includes Color PhotoGrade technology standard for near photographic-quality color
- Takes advantage of ColorSync 2.0 for outstanding color matching
- Includes 39 PostScript and 64 TrueType fonts

Ease of Use

- Offers easy, single-button installation of printing software and fonts
- Includes everything needed to print impressive color output; requires only six printer supplies (four toners, photo-conductor, and oil), and comes with complete starter set
- Includes a 250-sheet cassette and 100-sheet multipurpose tray; offers optional 250-sheet tray that supports letter, legal, A4, and B5

Compatibility

- Works with Windows 3.1 software-based systems, as well as with the full line of Macintosh and Power Macintosh computers

- Supports "plug and print" connection to both Apple systems and Windows 3.1 software-based computers
- Offers a range of plug and print networking: Standard LocalTalk, IEEE 1284 bi-directional parallel and Ethernet supporting AppleTalk, TCP/IP and Novell NetWare protocols

Enhanced Productivity

- Prints 12 pages per minute for black and white, 3 pages per minute for color, and 1 page per minute for transparencies
- Provides superior-quality and impressive performance through its powerful RISC processor—the 30-MHz AMD 29030—and Apple-designed color-matching and compression ASICs
- Includes a SCSI interface for hard disk drive font storage

Description

=====

The Color LaserWriter 12/600 PS is a high-quality PostScript laser printer that provides outstanding results for both color and black-and-white printing. It is ideal for anyone who requires convenient, superior-quality color printing capabilities at an affordable price.

Today, everyone from senior executives to sales professionals to schoolteachers is looking to improve the impact of printed documents by incorporating color. Color charts can highlight financial data, color logos can make product presentations more appealing, color graphics can grab—and hold—student interest, and on and on. Unfortunately, until now, high-quality color printing involved expensive specialized equipment that put it out of range for most of those who could benefit from it.

The Color LaserWriter 12/600 PS provides superior print quality and easy-set-up and use. With its 600-dot-per-inch and Color Photograde resolution, it provides the outstanding print quality you need—fast. In fact, the printer's speed is 12 pages per minute for monochrome and 3 pages per minute for color.

Yet for all its high performance, the Color LaserWriter 12/600 PS is incredibly easy to set up and use. It connects simply, and its printing software and fonts install in a single step. And it comes with everything you need to get started printing impressive color documents right away. In fact, it requires only six supplies, which contributes not only to its convenience, but also to its affordability—as does its easy and flexible networking capability, which lets you share the cost of the printer across an entire workgroup.

So if you want convenient, affordable color printing—without a compromise in quality—the Apple Color LaserWriter 12/600 PS is the printer for you.

Color LaserWriter 12/600 PS: DeskTop Printing Reqs 7.1.1 (7/95)

=====

Article Created: 6 June 1995
Article Reviewed/Updated: 19 July 1995

TOPIC -----

The DeskTop Printing Software was not installed with my Apple Color LaserWriter 12/600 PS installation. How can I get the Desktop Printing option?

DISCUSSION -----

If you have System 7.1 then Print Monitor 7.1.2 has been installed. DeskTop Printing software requires System 7.1.1 or higher. Specifically the Finder needs to be 7.1.3 or higher. After installing System 7.1.1 or greater, reinstall the Color LaserWriter 12/600 PS software and DeskTop Printing will be installed.

Color LaserWriter 12/600 PS: Halo in Bitmapped Text (10/96)

Revised: 10/23/96
Security: Everyone

Color LaserWriter 12/600 PS: Halo in Bitmapped Text (10/96)

=====

Article Created: 6 June 1995
Article Reviewed/Updated: 19 July 1995

TOPIC -----

I have an Apple Color LaserWriter 12/600 PS, and text, created with TrueType or PostScript fonts, prints fine, but equivalent bitmapped text sometimes prints blurry and exhibits a fuzzy halo effect. What is the problem?

DISCUSSION -----

When an object gets a full saturation of two colors, the haloing effect, which is normal to all laser imaging, is compounded. To offset this, the I/O controller checks incoming fonts and decrease their saturations slightly in cases where unacceptable haloing would otherwise occur. For example, a green font (pure cyan with pure yellow) might be adjusted to 80% cyan and 80% yellow. This adjustment does not visually alter the color. Since font ID drives this process, bit-mapped text is ignored and will be imaged as a normal graphic. To offset haloing in graphics, you must make adjustments by hand in the source application.

This information is also applicable to the Color LaserWriter 12/660 PS printer.

Color LaserWriter 12/600 PS: Matching Color w/ Two Printers 7/95

Revised: 7/19/95
Security: Everyone

Color LaserWriter 12/600 PS: Matching Color w/ Two Printers 7/95

Article Created: 6 June 1995
Article Reviewed/Updated: 19 July 1995

TOPIC -----

I have two Apple Color LaserWriter 12/600 PS printers, and I get slightly different colors from them. Is there any way to adjust the printers?

DISCUSSION -----

The printer is adjusted at the factory to produce the best possible image quality. All Color LaserWriter 12/600 PS printers come with these default settings in effect. To change the color balance refer to page 254 of the user's guide. This should only be used to make subtle changes to match multiple printers.

NOTE:

One correction to that page of the User's Guide is in the Read Me. On returning to factory default (Step #7), the manual says to first select a color and hold the + and - buttons together. Instead, just hold down the + and - buttons for about 5 seconds and all colors return to the factory default settings.

Color LaserWriter 12/600 PS: Reducing Oil on Paper (7/95)

Revised: 7/19/95
Security: Everyone

Color LaserWriter 12/600 PS: Reducing Oil on Paper (7/95)

Article Created: 6 June 1995
Article Reviewed/Updated: 19 July 1995

TOPIC -----

I have an Apple Color LaserWriter 12/600 PS, and I am getting oils spots on the paper. What can I do to prevent this?

DISCUSSION -----

The silicon oil is there to prevent the layers of toner from sticking to the fuser rollers. From time to time an oil spot may appear. Things that may cause it to happen with greater frequency are:

- Not having removed the orange spacers from inside the fuser access door.
- Turning the printer On and Off a number of times in a short period of time. For example, five times in an hour.
- After leaving the printer in idle mode for a long period of time, you may get a few spots of oil on the first couple of pages printed.
- Using recycled paper can plug the fuser's oil filter and cause long oil streaks on the back of the paper. Apple recommends that you use a good quality, non-fibrous paper. You will have to replace the fuser if you continue to use fibrous paper.

Color LaserWriter 12/600 PS: Technical Specifications (4/97)

Article Created: 6 June 1995
Article Reviewed/Updated: 30 April 1997

TOPIC -----

This article contains the technical specifications for the Apple Color LaserWriter 12/600 PS printer.

DISCUSSION -----

Technical Specifications
=====

Print Engine and Controller

- 30-MHz AMD 29030 RISC processor
- Engine life 300,000 pages monochrome, 150,000 pages color
- No monthly maximum duty cycle

Print Quality

- True 600-dpi resolution
- Color PhotoGrade, Apple's technology standard enhanced 600-dpi imaging, 200-lines per inch, nearly 2 times standard 600 DPI color laser printers

Memory

- 12MB of RAM standard; supports Color PhotoGrade. Apple contone compression technology enables 130MB of data to be printed with only a 12MB printer
- For best print quality when printing legal size,16MB recommended
- Expandable to 40MB with optional upgrades (1MB, 4MB, or 16MB 72-pin, 60ns SIMMs)

Interfaces

- Ethernet port (supports EtherTalk, TCP/IP, and Novell NetWare protocols)
- LocalTalk port
- All ports active simultaneously
- Bidirectional IEEE 1284 parallel port (special cable required)
- SCSI port for external or optional internal hard disk drive for font storage

Print Speed

- 12 pages per minute for monochrome
- 3 pages per minute for color
- 1 page per minute for transparencies
- Actual print speed is dependent upon file complexity, network traffic, application, and computer used.

Language Supported

- Adobe PostScript Level 2

Fonts

- 39 PostScript (Type 1) fonts in ROM, plus screen fonts for Macintosh and Windows from the following families:

ITC Avant Garde Gothic	ITC Bookman	Courier
Helvetica	Helvetica Narrow	Helvetica Condensed
New Century Schoolbook	Palatino	Symbol
Times	ITC Zapf Chancery	ITC Zapf Dingbats

- 64 TrueType fonts on Macintosh disks from the following families:

Chicago	Delphian	ITC Garamond Narrow
Geneva	Helvetica Black	Helvetica Compressed
Lubalin Graph	Lucida Bright	Machine
Monaco	Nadianne	New York
Old English Text	Onyx	Oxford
Swing	Zeal	

- Prints any PostScript (Type 1) or TrueType fonts

Storage

- Optional internal 240MB hard disk drive

Paper Capacities

- Standard 250-sheet feeder, 100-sheet multipurpose tray
- Optional 250-sheet universal feeder

Print Materials

- 16- to 24-lb. (60 to 90 g/m²) bond from the 250 sheet cassette
- 16- to 28-lb. (60 to 105 g/m²) bond from the multi-purpose tray
- Paper: U.S. letter, legal, A4, and B5
- Most letterhead and colored stock
- Use only Apple Color LaserWriter 12/600 PS transparencies

Printer Supplies

- Cyan, magenta, yellow, and black toner cartridges
 - Print 4,000 pages each at 5% coverage
- Photoconductor replacement kit
 - Prints 40,000 pages in black and white or 10,000 pages in color, continuous printing.
 - Prints 13,000 pages in black and white or 6,500 pages in color, intermittent printing. (Printing single-page documents only)
 - Includes two toner waste disposal containers
- Fuser oil
 - Prints 10,000 pages
- Fuser replacement kit
 - air filter, ozone filter, fuser unit transfer drum cleaning unit-replace at 60,000 pages

Power Requirements

- U.S./Japan: 100 to 120 V, 50 to 60 Hz or
- Europe/Australia: 220 to 240 V, 50 Hz
- Voltage tolerance +/- 10%

*Note: The Color LaserWriter 12/600PS does not contain a universal power supply

Power Consumption

- Operating mode: 100/120 V, 535 W; 220/240 V, 524 W
- Standby mode: 110/120 V, 215 W; 220/240 V, 238 W
- Energy-saving mode: 42 W (complies with EPA Energy Star)

Environmental Requirements

- Temperature: 50 to 86 deg. F (10 to 30 deg. C)
- Humidity: 20% to 80% noncondensing
- Toner cartridge transit environment: -4 to 104 deg. F (-20 to 40 deg. C)

Size and Weight

- Height: 18.0 in. (45.7 cm)
- Width: 21.0 in. (53.3 cm)
- Depth: 23.0 in. (58.4 cm)
- Weight: 110.0 lb. (49.5 kg)

System Requirements

-
- Works with an Apple Macintosh or compatible computer with at least 4MB of RAM and Macintosh system software version 7.1 or later.
 - Works with an IBM or compatible computer with at least 4MB of RAM and Microsoft Windows 3.1 or later.

Ordering Information

Apple Color LaserWriter 12/600 PS: Order No. B2392LL/A

LaserWriter 4/600 PS: Description (11/95)

=====
Article Created: 6 June 1995
Article Reviewed/Updated: 6 November 1995

TOPIC -----

This article contains a description of the Apple LaserWriter 4/600 PS printer.

DISCUSSION -----

Features
=====

Outstanding Print Quality

- Offers 600-dpi resolution
- Supports Adobe PostScript Level 2
- Comes with 64 PostScript and TrueType fonts

Ease of Ownership

- Connects simply via the Macintosh computer's built-in LocalTalk port
- Complies with the EPA's Energy Star guidelines for energy-efficient operation
- Prints extremely quietly, and makes no noise at all when not in use
- Features a compact, attractive design
- Desktop printing software allows drag-and-drop printing

Affordability and Expandability

- Provides advanced functionality at an affordable price
- Offers memory expansion
- Includes LaserBridge software 2.0 for EtherTalk network connection

Description
=====

The Apple LaserWriter 4/600 PS is an affordable PostScript laser printer that offers a number of advanced print capabilities. It's ideal for individual home, education, and small-business users who require outstanding print quality, PostScript capability and who desire future RAM expansion options.

As easy to own as it is to buy, the LaserWriter 4/600 PS connects simply, via the Macintosh computer's built-in LocalTalk port, and features an attractive, compact design. It also provides state-of-the-art energy efficiency. There's no on/off switch; instead, the printer "wakes up" when needed, operating the remainder of the time in an electricity-saving-and completely silent-standby mode.

Yet for all of its simplicity of set up and operation, the LaserWriter 4/600 PS offers a host of advanced capabilities. It features outstanding print quality, using Adobe PostScript Level 2. And the LaserWriter 4/600 PS comes with 64 PostScript and TrueType fonts.

As your printing needs become more sophisticated, the LaserWriter 4/600 PS is designed to grow to meet them. It supports a 4MB RAM Upgrade, which expands both the printer's memory cache and its ability to print documents that contain large numbers of downloadable fonts. Simply put, the LaserWriter 4/600 PS offers the PostScript printing capabilities you need-now and in the future.

This article provides the technical specifications for the Apple LaserWriter 4/600 PS printer.

DISCUSSION -----

Technical Specifications
=====

Print Engine and Controller

- True laser engine
- AMD 29200 RISC processor

Print Quality

- 600-dpi resolution
- 106-line screen
- 122 shades of gray

Memory

- 2MB of RAM standard with Adobe memory booster compression technology which allows printing of complex pages with less memory
- Expandable to 6MB with optional upgrade

Interface

- Connects using the LocalTalk port
- EtherTalk and TokenTalk connectivity through LaserWriter Bridge 2.0 software

Print Speed

- Four pages per minute maximum (actual speed varies depending on images printed and computer used)

System Requirements

- Macintosh computer with a 68020 or higher central processing unit (CPU). Any Macintosh except a Macintosh Plus, SE, Classic, Portable, or PowerBook 100 will work with the LaserWriter 4/600 PS.
- System software version 7.1.1 or later
- 4MB of RAM or more recommended

Software

- 64 scalable TrueType and 35 PostScript fonts included
- LaserWriter driver utility and new desktop printing with new print monitor

Fonts

- Apple Font Library (64 fonts total)

Begin_Table

- 35 fonts in ROM from the following font families:

Avant Garde	Bookman	Courier
Helvetica	Helvetica Narrow	New Century Schoolbook
Palatino	Symbol	Times
Zapf Chancery	Zapf Dingbats	

- 29 fonts on Macintosh disk from the following font families:

Chicago	Delphian	Garamond Narrow
Geneva	Helvetica Black	Helvetica Compressed
Lubalin Graph	Lucida Bright	Machine
Monaco	Nadianne	New York
Old English Text	Onyx	Oxford
Swing	Zeal	

End_Table

- Compatible with any TrueType or PostScript font

Paper Capacities

- Standard
 - Manual feed tray
 - 100-sheet universal cassette

Print Materials

- 16- to 28-lb. (60 to 80 g/m2) bond
- Paper: U.S. letter, U.S. legal, A4, executive

- Most letterhead and colored stock, labels, and envelopes
- Medium-weight photocopier transparencies

Power Requirements

- U.S./Japan: 100 to 115 V, 50 to 60 Hz
- Europe/Australia: 220 to 240 V, 50 Hz

Power Consumption

- Operating mode: 120 W average
- Standby mode: <10 W

Environmental Requirements

- Temperature: 50 to 90 deg. F (10 to 32 deg. C)
- Humidity: 20% to 80% noncondensing
- Toner cartridge transit environment: -4 to 104 deg. F (-20 to 40 deg. C)

Size and Weight

- Height: 6.3 in. (16.1 cm)
- Width: 15.2 in. (38.5 cm)
- Depth: 14.9 in. (37.9 cm)
- Weight: 15.4 lb. (7 kg) not including cartridge

Maximum Printable Area

The maximum margins for Letter and Legal paper on the LaserWriter 4/600 are:

Begin_Table

	Letter	Legal/US Legal
Left	.10	.10
Right	.19	.19
Top	.17	.15
Bottom	.13	.13

Maximum

Imageable Area 8.21 x 10.7 8.21 x 13.72

End_Table

The results are posted in fractions of an inch.

Third-Party NuBus DOS and Windows Options (6/95)

Revised: 6/6/95
Security: Everyone

Third-Party NuBus DOS and Windows Options (6/95)

=====

Article Created: 6 June 1995

TOPIC -----

I have a Power Macintosh and some earlier Macintosh Quadra computers, is there a hardware option for running DOS and Windows applications on them?

DISCUSSION -----

Yes, below are a few options you might consider. Apple does not recommend any third-party product over another.

OrangePC from Orange Micro

This is a NuBus card powered by a user selection of Intel 486 processors up to the DX 4/100. Additional features include up to 32 MB of onboard RAM, Super VGA graphics, file sharing, printing to the network printer and cut and paste between the Macintosh and PC environments. Optional features include serial and parallel ports and a PCMCIA slot for PC network connections.

DOS on MAC from Reply Corporation

This is a PDS Card powered by a user selection of Intel 486 processor up to DX 4/100 or Intel Overdrive DX/4. This card is currently available for Power Macintosh 7100/66, Centris 610, 650, Quadra 610, 650, 700, 800, 900 and 950 Macintosh systems. Additional features include up to 64MB of onboard RAM, second level cache, VGA and SVGA graphics, support for second monitor, printing to network printer and cut and past between Mac and PC environments. Optional features include serial and parallel ports, Network support including Novell Netware, TCP/IP, Windows for Workgroups for Ethernet and Token Ring and Creative Labs Sound Blaster 16 support.

Macintosh 630 Series Computers and SCSI Manager 4.3.1 (6/95)

Revised: 6/6/95
Security: Everyone

Macintosh 630 Series Computers and SCSI Manager 4.3.1 (6/95)

=====

Article Created: 6 June 1995

TOPIC -----

Customers who have a Macintosh LC 630, Quadra 630, Performa 630 series computers and are performing large transfers of data to an external SCSI drive will need to install the "630 SCSI Update" extension in order to alleviate a potential system error from occurring. The 630 SCSI Update is available from online services, and the Internet. Do I still need this update after installing System 7.5 Update 1.0?

DISCUSSION -----

The 630 SCSI Update was rolled into SCSI Manager 4.3.1 which is installed as part of System 7.5 Update 1.0. The installer for System 7.5 Update 1.0 will remove the 630 SCSI Update extension but will fail to install the SCSI Manager 4.3.1 extension unless a custom install is performed. A user must perform this custom installation by:

- 1) Double Clicking on Install System 7.5 Update document.
- 2) Click the Continue... button at the information screen.
- 3) Select the Custom Install command from the pop-up menu in the upper left portion of the Install window.
- 4) Scroll down to Extensions in the list of features to install and click on the triangle to the left, a sub listing will appear underneath.
- 5) Locate SCSI Manager in this list and click the checkbox to the left to select it.
- 6) Click the Install button and follow the instructions.

This will install the SCSI Manager 4.3.1 extension into the extensions folder located in the System folder.

Power Macintosh Upgrade Card and SCSI Manager 4.3.1 (6/95)

Revised: 6/6/95
Security: Everyone

Power Macintosh Upgrade Card and SCSI Manager 4.3.1 (6/95)

=====

Article Created: 6 June 1995

TOPIC -----

I have a Quadra 950 with a Power Macintosh Upgrade card installed and I'm using System software 7.1.2 which came with the card. I also have an 540 MB external hard drive attached. Do I need to be concerned with the formatting software I use for the external hard drive and whether it's SCSI Manager 4.3 complaint?

DISCUSSION -----

Yes, the Power Macintosh Upgrade Card has SCSI Manager 4.3 built into the ROM's therefore when you are in the Power Macintosh mode your system will be using SCSI Manager 4.3 so you should make sure the formatting software you use for your external drive is SCSI Manager 4.3 compliant.

Also, there has been an update to SCSI Manager 4.3 via System 7.5 Update 1.0 that takes SCSI Manager 4.3 to 4.3.1. Apple recommends users upgrade to the latest version of the system software if at all possible to take advantage the enhancements provide in the new system software.

These articles can help you locate the System 7.5 Update 1.0 software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

MAE 2.0 and Volumes Larger Than 2 GB Problem (6/95)

Revised: 6/6/95
Security: Everyone

MAE 2.0 and Volumes Larger Than 2 GB Problem (6/95)

=====

Article Created: 6 June 1995

TOPIC -----

MAE 2.0 on Solaris 2.4 shows negative file sizes on volumes larger than 2 GB. Some of my application's installers will not install because there is not enough disk space. My home directory is a volume larger than 2 GB.

DISCUSSION -----

This is a known issue and has been reported to engineering for investigation. As of June 1995 there is no time table for resolution.

Apple Displays: Gamma Numbers Associated w/ Gamma Tables (6/95)

Revised: 6/6/95
Security: Everyone

Apple Displays: Gamma Numbers Associated w/ Gamma Tables (6/95)

=====

Article Created: 6 June 1995

TOPIC -----

I am looking for the specific gamma numbers associated with the gamma tables; standard, uncorrected, and page white.

DISCUSSION -----

I assume you are referring to the gamma option settings in the Monitor control panel. Below is a little background for gamma correction and the Monitor control panel choices.

Background
=====

All CRTs have a non-linear relationship between light output and the video (cable) voltage input. The Monitor control panel gamma settings are used to correct non-linear light output for CRT type displays.

The gamma values that the Monitor control panel uses were originally derived for the first Macintosh RGB display from Apple. These values have been used since then, but may vary depending on the DAC/CLUT used in different Macintosh video circuitry. Also, many displays of the same model of any RGB monitor may show variances in gamma response due to the nature of CRTs and analog circuitry. Any mass produced display (Apple or non Apple) will have these variances.

The only method of obtaining accurate gamma response with any color display will be to use specialized light measurement devices with individual displays. The corrected gamma values that are given below are approximate values and can only be considered to be best estimates.

Uncorrected Gamma
=====

Uncorrected gamma provides a linear output for each of the red, green and blue video lines for stepped gray bars. This uncorrected gamma refers to the video signaling provided by the CPU and not the gamma value for the display. Uncorrected or linear gamma always has a value of 1.0.

Corrected Gammas =====

Macintosh Standard Gamma -----

The gamma value of the Macintosh Standard gamma refers to the video signaling provided by the computer and not the gamma value for the display. Macintosh Standard Gamma provided a video output that would help to correct for the Apple Color RGB Displays non-linear gamma. The Macintosh Standard Gamma had a value of 0.7 when using an original Mac video card. This corrected for the displays gamma of 1.4.

Page-white Gamma -----

Page White Gamma provides a non-linear gamma video output to correct for display non-linearity similar to Macintosh standard gamma. The original Page White Gamma had a value of 0.7. This corrects for a display gamma of 1.4. Additionally, Page-White Gamma provides a shift in color balance attempting to maintain a 6500 degree white point and colorless gray shades with the Apple Color RGB Display. This color balance shift was designed to correct for the displays original white point of 9300 degrees.

When reading the above, it is important to differentiate between the gamma value of the video signal and the gamma value of the display. The corrected gamma in the video signal is designed to counteract the non-linear gamma response of a particular display. If someone needs values for a color correction application, any monitor gamma parameter value between 1.4 and 1.8 should be sufficient. If a specific value is desired, a safe choice would be 1.4 or 1.6.

I would recommend not to get concerned about specific and exact numbers because display variances are probably larger than the fractional differences between these numbers. Screen measurement and calibration products are much better if you need exact corrections.

QuickTime: QuickTimeLib Not Available Message (8/96)

Revised: 8/2/96
Security: Everyone

QuickTime: QuickTimeLib Not Available Message (8/96)

=====

Article Created: 6 June 1995
Article Reviewed/Updated: 2 August 1996

TOPIC -----

When I launch a program on my Power Macintosh, it tells me that it cannot find QuickTimeLib. I have searched my hard drive but cannot find it. What is it and how do I get it?

DISCUSSION -----

QuickTimeLib is a code fragment that is part of the QuickTime PowerPlug extension. If QuickTime PowerPlug is disabled, damaged, or deleted you may get this message. The QuickTime PowerPlug extension can be reinstalled by performing a custom installation of QuickTime in the System 7.5 installer. For additional information on Power Macintosh code fragments, refer to the Tech Info Library article "Power Macintosh: Run Time Environment".

QuickTime 2.5

With the release of QuickTime 2.5 the QuickTimeLib not available message may be occurring because the Extensions Manager control panel is not recognizing the QuickTime PowerPlug (as well as QuickTime Musical Instruments) as part of the "System 7.5.x Only" set. If a user restarts with the "System 7.5.x Only" set, the Extensions Manager will not recognize these two extension and they will not load. Users need to make sure these extensions are active.

The reason for this is because, with QuickTime 2.5, the creator types for QuickTime PowerPlug and QuickTime Musical Instruments changed so these extensions could have their own individual icons. Since the creator types are different, and the Extensions Manager uses the creator type to recognize system extensions as part of the "System 7.5.x Only" set, the new creator type is not recognized as part of the "System 7.5.x Only" set.

Apple Certified Server Engineer (ACSE) Program (7/95)

Revised: 7/27/95
Security: Everyone

Apple Certified Server Engineer (ACSE) Program (7/95)

=====

Article Created: 7 June 1995
Article Reviewed/Updated: 27 July 1995

TOPIC -----

This article describes the Apple Certified Server Engineer (ACSE) Program.

DISCUSSION -----

The Apple Certified Server Engineer (ACSE) Program institutes an industry certification in Workgroup Server and networking technologies. It provides a reliable indicator of the technical capability of certified individuals.

This document outlines the Apple Certified Server Engineer program, its purpose, operational characteristics, and details on pursuing a certification.

Overview

This certification has been created to identify individuals that have demonstrated their capability to install and support Apple Workgroup Servers and design or manage AppleTalk based networks. Candidates who successfully complete this certification are demonstrating their ability to provide knowledgeable support and troubleshooting of server installations, AppleTalk based network design, and AppleShare based server tuning and implementations.

The overall purpose of this program is to:

- Identify individuals with proven Workgroup Server support skill.
- Encourage further development of support skills by providing a skill development path
- Encourage an employer's investment in Apple support skills by providing a method of measurement and recognition of these skills.

This certification program is a cornerstone of the new Apple Premium Server Reseller Program. This program was created to identify Apple authorized resellers that are committed to the business of selling servers and workgroup solutions. This program requires the reseller have an ACSE on staff.

Definition of Certification

This certification is earned by the successful completion of three tests. It is important to note that the certification does not require any class attendance. These tests will be administered by Drake Prometric through their worldwide organization of testing centers. Any and every person is eligible for this certification. It is Apple's hope that people outside of the Apple authorized reseller community will become certified as well. It is anticipated that professional support people in customer locations and internal Apple personnel will attempt certification. This certification offers them a way to demonstrate their level of product knowledge as defined by Apple Computer.

When a candidate successfully passes these three tests and signs an agreement with Apple the candidate becomes an Apple Certified Server Engineer. This certification automatically expires after two years unless the certification holder retests successfully. These recertification tests give employers of certification holders the confidence that their knowledge is timely. This gives Apple the opportunity to keep these certified individuals technically current on Apple's view of important technology and products.

The current version of the certification covers technology associated with Mac OS - AppleShare based servers only. This initial certification does not have parts or levels. Later versions of the certification might have different components that reflect different product expertise.

Completion of this certification earns the individual the right to use a certification icon for business cards, and other relevant materials.

Test Preparation

Apple has taken steps to ensure candidates are provided with two different methods of test preparation. Since this certification is based on successful completion of tests there is no requirement for specific training classes.

- Self-Study

One method of test preparation is to acquire the classroom material to use as self-study guides. Four guides are available from Network Frontiers today to cover the material taught in the classes. The cost of the guides range from \$40 to \$65 and are available directly from Network Frontiers. In the future, textbooks will be available from commercial book sellers.

- Classes

Apple has arranged for classes to be available for those that choose to prepare for the tests with training. Apple has a contractual arrangement with Network Frontiers to provide classes tailored to these tests. These classes are available today nationwide, and the schedule will grow as class demands grow. To register for a class, call Network Frontiers at 800-NET-TRN1 or 415-896-2939 for

the schedule and dates. They can be reached by AppleLink at NETFRONTIERS. Network Frontiers is an Apple Preferred Provider of this training.

Test Details

Initially there are three tests for Mac OS based certification:

- The first test covers installation, tuning, management, and support of AppleShare based servers. This includes AppleShare version comparisons, Server Manager software overview, backup strategies, AppleShare install and configuration, and installation design.
- The second test is the design of AppleTalk based networks, which includes design, media choices, planning and sizing network installations, multiprotocol issues, and services tuning.
- The third test is AppleTalk network management. This includes more network design issues, software license management, network station and traffic management techniques/tools.

Drake's testing service provides a specific type of testing capability. Their testing centers provide a consistent environment to take computer given and graded tests. Each test is one hour in length. Each test topic has several tests that are randomly chosen for each testing instance. Thus, an individual who is repeating a test will not necessarily take the same test.

A \$95 administrative fee for each test is payable at the time of testing to Drake. To sign up for a test, contact Drake directly. Drake is unable to answer program questions and is not able to schedule tests until they are available, which is currently scheduled for mid August 1995. Please do not call Drake's registration line until then. Call the program information line at 408-862-3385 for details on test availability. Until October 1, priority attendance will be given for technical employees of resellers attempting to achieve authorization in the Apple Premium Server Reseller Program.

For more information

Call the Certification Program information line at 408-862-3385 from 8 AM to 4 PM Pacific Time. For training registration or study guide orders, contact Network Frontiers directly at 800-638-8761.

As candidates work through the certification process they can call Apple to check their status, change their address, verify the credentials of an individual, and get general program information. The number is 408-862-3385 (8 AM to 4 PM Pacific Time).

Performa 5200:Global Village TelePort & Busy Serial Port (7/95)

Revised: 7/11/95
Security: Everyone

Performa 5200:Global Village TelePort & Busy Serial Port (7/95)

Article Created: 7 June 1995
Article Reviewed/Updated: 11 July 1995

TOPIC -----

Every time I start up my Macintosh Performa 5200 computer I get a message stating that the modem cannot be found. When I try to reset the modem from the TelePort control panel the computer tells me the serial port is busy.

It is important to note that this happened even before I installed or removed any software from my computer, in other words, this is how it has been behaving right "out of the box". What is wrong?

DISCUSSION -----

Symptoms

The following issue has been reported on Macintosh Performa 5200, 580, 640, and Power Macintosh 6100 series computers.

On startup, when the Global Village Registration software launches, it puts up a stop alert stating:

"Can't find or can't access a modem to use for registration. Make sure you have Global Village software installed correctly, reboot your computer, and try again. If you want to use a specific modem for registration, select it from Chooser."

If you try to reset the modem in the TelePort control panel, you get a warning alert stating:

"The current port is busy and cannot be opened. Quit any open communication application, or turn off AppleTalk in the Chooser (if the modem is connected to the Printer port), and then reopen the TelePort control panel."

Macintosh Performa 5200

Extensive testing on a Macintosh Performa 5200 computer running System 7.5.1 with GlobalFax 2.5P indicates that the problem can be reproduced simply by restarting the computer while the network is set to anything besides AppleTalk active in the Chooser and LocalTalk as the network in the Network control panel. In other words, restarting with AppleTalk set to Inactive or Ethernet selected in the Network control panel results in the messages documented above.

Other Macintosh Computers

We have seen the same problem, as noted on the Macintosh Performa 5200, on some other Macintosh computers: the Macintosh Performa 580, 640, and Power Macintosh 6100 series of computers (including the Workgroup Server 6150). The problem does not occur as readily on these computers but, if you switch between LocalTalk and Ethernet, or between AppleTalk active and inactive enough times, the problem will occur.

Solution

The "Busy Serial Port" issue is a software problem. Not a hardware problem. Global Village has provided Apple with an update, GlobalFax 2.5.2P Update, which will correct the problem.

Install the update following these steps:

Step 1

Restart the computer with Extensions Off by holding down the Shift key at startup.

Step 2

Double-click on the Performa GlobalFax 2.5.2 Update icon.

Step 3

Click on the Update button and watch for an update confirmation window.

Step 4

Restart the computer.

While these steps will update the Global Village software currently on their computers, users should be advised to keep a backup copy of the Update program in case they reinstall the software from their backup CD. At that time, they would need to run the Update program again.

Apple Media Tool: Styled Text Requires Additional Filters (7/95)

=====

Article Created: 7 June 1995
Article Reviewed/Updated: 19 July 1995

TOPIC -----

Does the Apple Media Tool support more than one text style in a text media element? If so, how can I import formatted (styled) text from word processors like MacWrite Pro, Microsoft Word, or others?

DISCUSSION -----

The Apple Media Tool is very limited in the text it supports. You cannot import formatted text from MacWrite Pro, Microsoft Word, or other word processors. This is because of the cross-platform requirements of the Apple Media Tool. Art of Memory Ltd. (+44 (0) 1386 841496 or AppleLink UK0304) has an Apple Media Tool Programming Environment package called TextPak, which allows much greater text handling capability when using the Apple Media Tool Programming Environment.

Because all text used within TextPak is held as plain ASCII, with embedded style commands, the texts used in your project can be easily maintained separately from your program code, in the same way that the Apple Media Tool separates media items from code.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Security: Everyone

DOS Compatible Products: Frequently Asked Questions (4/97)

Article Created: 7 June 1995
Article Reviewed/Updated: 03 April 1997

TOPIC -----

This document contains the answers to frequently asked questions (FAQ) about Apple's cross-platform (DOS compatible) products.

Questions In this FAQ:
=====

- I have an AppleCD 300e Plus CD-ROM drive and want to use it on a PC-compatible computer. Where can I get the drivers for it?
- I have a DOS Compatibility Card and am getting an error message at startup: "PC Network Extension: AgentOpen () returned -1." How can I stop this?
- I have a DOS Compatibility Card and when I try to switch to the PC side, I get an this error, "Diskette error-correct problem and press any key to retry." Why?
- What operating systems does the DOS Compatibility Card support?
- What kind of memory does the DOS Compatibility Card use?
- How do I install the DOS mouse driver on my DOS compatible?
- Can I use a third-party CD-ROM drive with my DOS Compatibility Card?

DISCUSSION -----

Question: I have an AppleCD 300e Plus CD-ROM drive and want to use it on a PC-compatible computer. Where can I get the drivers for it?

Answer: Apple does not write MS-DOS software drivers for any AppleCD player.

MS-DOS drivers are written by other developers for Apple. The Apple Multimedia Kit for Windows includes a third-party SCSI adapter card with the appropriate CD-ROM driver software. The software can only be distributed with the Apple Multimedia Kit. You may want to look in the Redgate Macintosh Product Registry to locate a possible third-party solution. Corel and Trantor are two possible suppliers of CD-ROM driver software.

Question: I have a DOS Compatibility Card and am getting an error message at startup: "PC Network Extension: AgentOpen () returned -1." How can I stop this?

Answer: The PC Network Extension lets the DOS Compatibility Card access built-in Ethernet. The error message results when the PC Network Extension is looking for a network that is not present. Usually this is because AppleTalk is off. To eliminate the error at startup, you have three options.

(1) Upgrade to version 1.0.7 of the PC Setup software.*

(2) Use the Chooser to turn AppleTalk on.

(3) Drag the PC Networking Extension from the Extensions folder to the Trash (provided that you are not using a PC network).

The PC Network Extension is not required unless you plan on using network services on the DOS Compatibility Card. If you are using the DOS Compatibility Card's networking capabilities, make sure AppleTalk is active.

***NOTE:**

PC Setup software v1.0.7 is not compatible with the DOS Compatibility Card for the Macintosh Quadra 610 or Centris 610.

Question: I have a DOS Compatibility Card and when I try to switch to the PC side, I get an this error, "Diskette error-correct problem and press any key to retry." Why?

Answer: You are getting the disk error because there is no drive container selected. Open the PC Setup control panel and make sure that the C:\> option does not say None. If it does, pull down that C:\> menu and select another drive file. Look for a file named PC Drive File. That is the factory installed drive container. If you can not find it, you need to create a new drive container. Consult your DOS Compatibility Card User's Manual for complete instructions.

Question: What operating systems does the DOS Compatibility Card support?

Answer: Apple supports only the following operating systems on the DOS Compatibility Card:

DOS 6.22

Windows 3.1

Windows 95*

Any operating system that accesses hardware directly fails on the DOS Compatibility Card. Windows NT, Windows for Workgroups**, and OS/2 fall into this category, so they do not work.

*NOTE: Although Windows 95 is compatible with Apple's DOS Compatibility Card, it is supported by Microsoft, not by Apple.

**NOTE: Windows for Workgroups works in a limited fashion on the DOS Compatibility Card, however Apple does not support this operating system on the DOS Compatibility Card.

Question: What kind of memory does the DOS Compatibility Card use?

Answer: The DOS Compatibility Card has a slot for one SIMM. It can be filled with a 72-pin, 80 nanosecond, non-Composite SIMM. The DOS Compatibility Card can accommodate up to 32 MB of RAM.

Question: How do I install the DOS mouse driver on my DOS compatible?

Answer: The following information has not been fully tested by Apple, so this method is not supported by Apple Computer.

You can install a DOS mouse driver by inserting Windows disk #4 into the floppy drive and typing the following at the c:\> prompt:

```
EXPAND A:MOUSEHP.CO_ C:\WINDOWS\MOUSEHP.COM <RETURN>
```

Then add the following line to the end of your AUTOEXEC.BAT file:

```
MOUSEHP
```

Question: Can I use a third-party CD-ROM drive with my DOS Compatibility Card?

Answer: Some third-party drives work and others do not, depending on the software provided by the vendor. You should call the vendor of any peripheral you plan on purchasing to verify compatibility with your other products.

MAE & Solaris 2.4 and Later: Mounting Mac CD-ROM Discs (1/97)

Revised: 1/8/97
Security: Everyone

MAE & Solaris 2.4 and Later: Mounting Mac CD-ROM Discs (1/97)

Article Created: 8 June 1995
Article Reviewed/Updated: 8 January 1997

TOPIC -----

When running Solaris 2.3, I was able to edit my macdisk.solaris preference file and mount my Macintosh formatted CD-ROM discs and floppies without difficulty. However, since upgrading to Solaris 2.4, I am not able to mount my Macintosh formatted CD-ROM discs and floppies, even though my macdisk.solaris file is set the same way. What is the problem?

DISCUSSION -----

To have CD-ROM discs mount in MAE while running Solaris 2.4 and later (this occurs with Solaris 2.5 also), follow these steps:

Step 1 - (For Solaris 2.4 Only)

Verify that Volume Manager patch 101907-05 has been loaded. Sun recommends this patch when using the Volume Manager. The following UNIX command lists all installed patches:

```
/etc/showrev -p
```

Step 2

Under Solaris 2.4 and later, modify the macdisk.solaris file in this manner (scsi6 should be replaced with the correct SCSI ID# of the CD Drive):

```
scsi6:removable:ro:/vol/dev/aliases/cdrom0
```

NOTE: After inserting a CD-ROM disc, wait 10 seconds before attempting to mount it in MAE. The Volume Manager must first create an entry in aliases for cdrom0 before MAE can read the alias directory.

NOTE: MAE will only mount MachFS CD-ROM discs. If it is a UNIX or ISO formatted

CD-ROM, you will need to navigate to the /cdrom directory to see the CD-ROM.

This article was published in the "Information Alley":
Volume II, Issue 11, Page 19

Step 3

Relaunch MAE and you will be able to access CD-ROM discs.

Article Change History:

08 Jan 1997 - Made correction for technical accuracy.

LW Bridge 2.0: LocalTalk Printing For Ethernet Users Only-6/95

Revised: 6/8/95
Security: Everyone

LW Bridge 2.0: LocalTalk Printing For Ethernet Users Only-6/95

=====

Article Created: 8 June 1995

TOPIC -----

I've loaded the LaserWriter Bridge 2.0 software on a computer connecting the LocalTalk to Ethernet segments of my network. Users on the LocalTalk segment can see the printers on LocalTalk in the Chooser, but they cannot see printers on Ethernet in the Chooser. All of the Ethernet users can access the LocalTalk printers.

Shouldn't the LaserWriter Bridge 2.0 software let my LocalTalk users print to LaserWriters on the Ethernet segment of the network?

DISCUSSION -----

The LaserWriter Bridge 2.0 software is designed to let Ethernet users print to LocalTalk connected printers only.

If you are interested in having LocalTalk access to network services on an Ethernet segment, use the LocalTalk Bridge 2.0 product. This product provides full connectivity in both directions.

DISCUSSION -----

Upgradable Microprocessor

- PowerPC 604 RISC microprocessor running at 132 MHz*
(*Only available on the Power Macintosh 9500/132.)
- PowerPC 604 RISC microprocessor running at 120 MHz*
(*Only available on the Power Macintosh 9500/120.)
- Processor upgradable to 250 MHz
- Integrated floating-point unit and 32K cache
- 40 MHz system bus for 120 MHz configurations
- 44 MHz system bus for 132 MHz configurations

Memory

- 16 MB of RAM standard, expandable to 768 MB of RAM
(Note: There is no RAM soldered to the logic board. There are a total of 12 DIMM slots; consisting of six A slots and six B slots. Configuration of memory installed at the factory will vary by market.)
- Uses 168-pin, 64-bit, 70ns DRAM DIMMs
- 4 MB of read-only memory (ROM)
- 8 K of nonvolatile parameter memory
- 512K Level 2 cache (soldered to the logic board, not upgradeable)

Disk Drives

- Includes one built-in Apple SuperDrive 1.4 MB floppy disk drive that uses high-density floppy disks and reads, writes, and formats Macintosh,

Windows, MS-DOS, OS/2, and ProDOS disks

- Includes one internal SCSI hard disk (1 GB and 2 GB options available)
- Includes one AppleCD 600i quadruple-speed

Optional Display Support (using accelerated graphics card)

-
- All Apple displays, except the Macintosh 12-in. RGB display***
 - Third-party displays including VGA and SVGA monitors
(Only available on the Power Macintosh 9500/120.*)

Video Support (using accelerated graphics card)

-
- 2MB of VRAM, expandable to 4MB
(Only available on the Power Macintosh 9500/120.*)

Begin_Table

Color depth support for the Power Macintosh 9500/120

	Power Macintosh 9500/120* with 2 MB VRAM -----	Power Macintosh 9500/120** with 4 MB VRAM -----
Display Resolution -----		
640x480	16.7 million colors	16.7 million colors
832x624	16.7 million colors	16.7 million colors
1,024x768	32,768 colors	16.7 million colors
1,152x870	32,768 colors	16.7 million colors
1,280x1,024	256 colors	32,768 colors

End_Table

*With Apple Accelerated Graphics Card

**With Apple Accelerated Graphics Card and 2 MB VRAM upgrade card

***The Macintosh 12-inch RGB display cannot be used with the Power Macintosh 9500 series. NOTE: This monitor is incorrectly listed as compatible in the booklet included with each unit titled "Technical Information: Specifications for Power Macintosh 9500 series computers."

Interfaces

-
- One Apple Desktop Bus (ADB) port for a keyboard, mouse, and other ADB device; supports up to 3 ADB input devices daisy-chained through a low-speed, synchronous serial bus
 - One 10Base-T Ethernet connector (NOTE: If both 10BASE-T and AAUI connectors are plugged in, the computer uses the 10BASE-T connector)

by default.)

- One AAUI-15 Ethernet connector
- Two DMA serial (RS-232/RS-422) ports compatible with LocalTalk and GeoPort cables, 230.4 Kbits per second maximum (up to 2.048 Mbits per second if clocked externally).
- One Dual-channel asynchronous SCSI interface: external channel supports up to seven SCSI devices (5 MB/sec); internal channel supports a hard disk array (10 MB/sec). There are three internal bays for SCSI devices (and one for the floppy drive).
- One sound output port for stereo compact disc audio and stereo computer-generated sound.
- One 3.5mm, line-level sound input port for 16 bit stereo sound input. The sound input port supports the Apple PlainTalk microphone. The sound input port also supports a standard stereo (miniplug-to-RCA) cable adapter for connecting stereo equipment to your computer. It does not support the omnidirectional microphone (the round microphone shipped with some earlier models of Macintosh computers) or the attenuated RCA adapter provided with some other Macintosh computers.
- One DB-15 video port for display on optional accelerated graphics card* (*This option is available on the Power Macintosh 9500/120 only.)
- Six high-performance PCI expansion slots compatible with all PCI 2.0 specification-compliant cards* (*These slots are not NuBus-compatible)

Audio System

-
- Custom sound circuitry, including stereo generator (digital-to-analog converter, or DAC) -- capable of driving stereo miniplug headphones or audio equipment -- and stereo sampling hardware (analog-to digital converter, or ADC) for recording stereo sound
 - 16-bit stereo input and output
 - Sample rates of 44.1 and 22.05 kilohertz (kHz)
 - Input line level: 2.8 volts peak-to-peak nominal, into 6.5-kohm impedance
 - Output line level: 3.0 Vpp (volts peak-to-peak nominal), into 1-kohm impedance
 - Input SNR (signal-to-noise ratio): less than 74 decibels (dB)
 - non-weighted with no audible discrete tones
 - Output SNR: less than 82 dB non-weighted with no audible discrete tones
 - Bandwidth/Frequency Response: 20 Hz-17 kHz (+/- 0.8 dB) at 44.100 kHz sample rate; 20 Hz-19 kHz (+/- 2.0 dB) at 44.100 kHz sample rate
 - THD+N (Total harmonic distortion plus noise): Less than 0.05 percent; measured 20 Hz-20kHz with a 2.5 Vpp sine wave input

Networking

-
- Built-in Ethernet (10Base-T or AAUI-15)
 - Two serial ports for LocalTalk, external modem, or other devices

Keyboard and Mouse

-
- Supports all Apple ADB keyboards, including those with numeric keypads
 - Includes ADB Mouse II

Clock/Calendar

- CMOS custom integrated circuit with long-life lithium battery

Electrical Requirements

- AC Line Input
 - Line voltage: 100 to 240 volts (V) alternating current (AC), RMS single phase, automatically configured
 - Frequency: 50 to 60 Hz
 - Power: 340 watts (W) maximum continuous (not including display); 520 W peak input
- AC Line Output
 - Output receptacle: 100-120 V, 3 A AC, 220-240 V, 1.5 A AC RMS (determined by actual input voltage); 3 A maximum at 100 V
- DC Power
 - Continuous output: 225 W
 - Peak output (for 12 seconds at startup): 328 W

Begin_Table

Current Type	Total*
+5 V	35 A**
+12 V	5 A
+3.3 V	20 A**
-12 V	0.75 A

End_Table

*Overall system power consumption cannot exceed 225 watts.

**Total for +3.3 and +5 V current cannot exceed 35 A.

Power Requirements For Devices Which Can Be Connected

- Apple Desktop Bus (ADB)
 - Mouse draws 10 milliamperes (mA)
 - Keyboard draws 25 to 80 mA (varies with keyboard model used)
 - Maximum current draw for all ADB devices: 500 mA (a maximum of three ADB devices is supported)
- Audio and Telecommunications Devices

Begin_Table

- Power allowances for external devices connected to ports:

Device	Voltage	Current	Power
Microphone	+5V	20 mA	100 mW
Serial ports/Geoport			

telecom adapter	+5V	500 mA	2.5 W
-----------------	-----	--------	-------

- Expansion Cards and Devices:

Device	Voltage	Current	Power
-----	-----	-----	-----
Expansion Card (15 W)*	+5 V	3 A	15 W
	+12 V	0.500 A	6 W
	-12 V	0.100 A	1.2 W
	+3.3 V	2 A	6.6 W
Expansion Card (25 W)*	+5 V	5 A	25 W
	+12 V	0.500 A	6 W
	-12 V	0.100 A	1.2 W
	+3.3 V	2 A	6.6 W
Storage Device (such as CD-ROM drive)	+5 V	9 A	45 W
	+12 V	3 A	36 W
	+12 V	7.5 A peak***	

End_Table

*15-watt expansion cards should not consume more than 15 W of power total.

**25-watt expansion cards shouldn't consume more than 25 W of power total.

***Peak power is for startup only and must not occur in normal operation.

Size and weight

- Main Unit
 - Height: 16.90 inches (430 mm)
 - Width: 7.75 inches (196 mm)
 - Depth: 15.75 inches (400 mm)
 - Weight: 28 lb. (12.7 kg) (varies based on internal devices installed)
- Mouse
 - Height: 1.3 inches (33 mm)
 - Width: 2.4 inches (61 mm)
 - Depth: 4.2 inches (107 mm)
 - Weight: 4 ounces (0.11 kg)

Operating environment

- Operating temperature: 50 degrees to 104 degrees F
(10 degrees to 40 degrees C)
- Storage temperature: -40 degrees to 116.6 degrees F
(-40 degrees to 47 degrees C)
- Relative humidity: 5 percent to 95 percent noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

System Software Requirements

Requires System 7.5.2 for Power Macintosh or later and the accompanying System Enabler.

(Optional) 600i CD-ROM Drive Specifications

NOTE:

The Technical Specifications Booklet that comes with the Power Macintosh 9500 series computers lists the CD-ROM Drive as optional. However, every Power Macintosh 9500 Series computer does come with an internal CD-ROM drive. In other words, it is not optional.

- Supports a 3.5-inch half-height removable media device and two 3.5-inch half-height hard disk drives

- Disc diameter: 5.25 inches (120 mm) and 80 mm

- Scanning velocity: 1.2-1.4 meters per second

- Rotation speed (average): Varies over radius

Normal speed: 530 to 230 revolutions per minute (rpm)

Double speed: 1060 to 460 rpm

Quadruple speed: 2120 to 920 rpm

- Latency (average): Varies over radius

Normal speed: 55 to 130 milliseconds (ms)

Double speed: 27.5 to 65 ms

Quadruple speed: 13.75 to 32.5 ms

- Blocks per rotation (average): 8.4 to 19.5 variable

- Average access time (typical):

Normal speed: 380 ms

Double speed: 270 ms

Quadruple speed: 200 ms

- Data

- Data capacity: 656 MB, Mode 1; 748 MB Mode 2

- Number of blocks per disc: 336,150

- Data per block: 2048 bytes, Mode 1; 2336 bytes, Mode 2

- Address description: Minutes, seconds, blocks

- Audio capacity

- Playing time: 74 minutes, 42 seconds

- Modes Supported

- Audio CD:

- CD-ROM: Modes 1 and 2

- CD-ROM XA: Mode 2, Forms 1 and 2

- Photo CD

- Video CD

- Data Streaming and Transfer Rates

- Blocks per second

Normal speed: 75

Double speed: 150

Quadruple speed: 300

- User kilobytes (K) per second

Normal speed: 150K, Mode 1; 171.1K, Mode 2

Double speed: 300K, Mode 1; 342.2K, Mode 2

Quadruple speed: 600K, Mode 1; 684.4K, Mode 2

- SCSI bus burst rate (typical)

- Asynchronous: 5.0 MB per second

- Synchronous: 5.0 MB per second

- Laser

- Type: Semiconductor GaAlAs laser

- Wavelength: 790 +/- 25 nanometers

- Output power: 0.2 to 0.6 milliwatts
- Beam divergence: 55 degrees

Security: Everyone

Power Macintosh 9500 120 & 132: Description (4/97)

Article Created: 8 June 1995
Article Reviewed/Updated: 29 April 1997

TOPIC -----

This article contains a description of the Power Macintosh 9500 series of computers.

DISCUSSION -----

Overview

The Apple Power Macintosh 9500 computers set new Macintosh speed, performance, expandability, and upgradability standards, which is tremendous news for publishers, engineers, and multimedia professionals.

Choose from the Power Macintosh 9500/120 or the Power Macintosh 9500/132, the fastest Macintosh computer ever. With six slots each that support the industry-standard high-performance PCI architecture, they are the most customizable, expandable Macintosh computers in history. And PCI technology promises low-cost cards for such uses as videoconferencing, video production, and high-speed networking.

Built with the ultra-high-speed, high-efficiency PowerPC 604 processor chips, which run at 120 or 132 megahertz, they will be able to perform faster than ever. That is because they are upgradable, so as faster processors become available, you will have the opportunity to easily upgrade your computer.

The Power Macintosh 9500 series of computers run virtually all Macintosh applications, as well as applications accelerated for Power Macintosh computers. They can also run MS-DOS and Windows applications using SoftWindows software, available from Insignia Systems.

With its accelerated graphics card, the Power Macintosh 9500/120 computer supports all Apple and most third-party displays, including monochrome, color, VGA, and SVGA displays. It supports up to 16.7 million colors on Apple color

displays of up to 17 inches. With the addition of 2 megabytes of VRAM (for a total of 4 megabytes), the 9500/120 supports 16.7 million colors on displays of up to 21 inches.*

The Power Macintosh 9500 computers are designed to meet the most demanding power, speed, and expandability requirements of publishing, engineering, and multimedia customers.

*IMPORTANT NOTE: The Power Macintosh 9500/132 requires a third-party (non-Apple) graphics accelerator for display support.

Power and speed

- 120-MHz or 132-MHz PowerPC 604 microprocessor, including floating-point processor and 32K cache
- 512K Level 2 cache
- Processor upgradability to 250 MHz

Memory

- 16 MB of RAM, expandable to 768MB

Display support

- Graphics accelerator card includes 2MB of VRAM, expandable to 4MB (for the Power Macintosh 9500/120 only)
- Supports up to 1,280- by 1,024-pixel resolution

Expansion

- Six PCI slots for expansion cards
- Eight built-in ports to support a wide range of peripherals
- Dual-channel SCSI connector for hard disks, CD-ROM drives, and other SCSI devices
- Two open internal expansion bays for additional hard disk drives or other SCSI devices
- On-board Ethernet (10Base-T and AAUI)
- Internal quadruple-speed CD-ROM drive and microphone included

System Software 7.5

- Makes working with applications consistent, so they are easier to learn and use
- Allows easy customization of your Macintosh to fit the way you work
- Provides active assistance in learning new features with Apple Guide
- Lets you open and use MS-DOS and Windows documents

Communications/Networking

- Two serial ports compatible with GeoPort and LocalTalk cables
- 16-bit stereo audio input and output ports

- Built-in Ethernet networking
- Background file sharing

Compatibility

- Runs 68K Macintosh applications and applications accelerated for Power Macintosh computers
- Runs MS-DOS and Windows applications via SoftWindows
- Reads Macintosh, Windows, MS-DOS, OS/2, and ProDOS floppy disk formats

What Is In The Box:

Each Power Macintosh 9500 series unit includes a power cord, keyboard cable, Apple Desktop Bus Mouse II, PlainTalk microphone, and an Apple Macintosh CD.

The Apple Macintosh CD includes the following:

- Install System Software
 - System Software 7.5.2, including PowerTalk and QuickDraw GX
- Apple Extras
 - Universal Access: CloseView and Easy Access control panels
 - Expansion Card Info
 - AppleScript
 - HyperCard Player 2.2
 - QuickTime Extras
 - PowerTalk Extras
 - Text-to-Speech
 - QuickDraw GX Extras
 - Eric's Solitaire Sampler
 - Acrobat Reader 2.0.1
- Utilities:
 - Drive setup 1.0
 - Disk First Aid 7.2.1
 - Disk Copy 4.2
 - SimpleText 1.2
- Install Macintosh Tutorial
- Disk Images
 - Disk Copy 4.2
 - System Software
 - PowerTalk
 - QuickDraw GX

Documentation included with the Power Macintosh 9500 series of computers:

- Power Macintosh User's Guide manual
- Technical Information booklet
- Graphics Card Upgrade, PCI Products brochures
- Apple Resource Guide
- Product Registration Card
- Warranty Card

Configurations and Ordering Information

- Power Macintosh 9500/132*

- 16MB of RAM
 - Built-in 1.4 MB Apple SuperDrive floppy disk drive
 - Internal 2GB hard disk drive
 - Internal quadruple-speed CD-ROM drive
 - Order No. M4423LL/A
- Power Macintosh 9500/120*
 - 16MB of RAM
 - 2MB of VRAM on the Apple Accelerated Graphics Card
 - Built-in 1.4MB Apple SuperDrive floppy disk drive
 - Internal quadruple-speed CD-ROM drive
 - Internal 1GB hard disk drive
 - Order No. M3093LL/A
- Power Macintosh GeoPort
 - Order No. M3127LL/A
- Macintosh Memory Expansion Kits
 - (Must be installed by an authorized service provider.)
 - 8MB (1-8MB DRAM DIMM)
Order No. M3788LL/A
 - 16MB (1-16MB DRAM DIMM)
Order No. M3789LL/A

NOTE:

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and configurations.

LocalTalk Bridge 2.0: Apple MessagePad Connectivity (6/95)

Revised: 6/8/95
Security: Everyone

LocalTalk Bridge 2.0: Apple MessagePad Connectivity (6/95)

=====

Article Created: 8 June 1995

TOPIC -----

I've got an Apple MessagePad which has built in LocalTalk, and an Ethernet network in my office. How can I get my Apple MessagePad to work with Ethernet devices?

DISCUSSION -----

Apple MessagePad users often want to print to Ethernet printers or access the Connection kit on Macintosh computers on Ethernet.

The LocalTalk Bridge 2.0 should work in your situation. This software will allow devices on LocalTalk (including the Apple MessagePad) to see Ethernet devices (like LaserWriter printers or Macintosh computers running the Newton Connection kit).

Remember to set you Newton Connection Kit preferences to "allow connection via network" and do not configure "allow connection via serial port to use the printer port".

LaserWriter Bridge 1.0 Functions as a LocalTalk Bridge (6/95)

Revised: 6/8/95
Security: Everyone

LaserWriter Bridge 1.0 Functions as a LocalTalk Bridge (6/95)

=====

Article Created: 8 June 1995

TOPIC -----

Does the LaserWriter Bridge 1.0 do more than just bridge one LaserWriter? Customers sometimes say they are using it to bridge PowerBook computers, Apple MessagePads, and so on.

DISCUSSION -----

Testing indicates that the LaserWriter Bridge 1.0 functions as a full LocalTalk bridge, however bridging occurs for only the first device the bridge recognizes. Use of the LaserWriter Bridge 1.0 for anything other than a LocalTalk network with one LaserWriter Select 360 is not supported.

Testing indicates that MicroPrint hardware functions as a full LocalTalk bridge as well. Again, Apple supports the MicroPrint for use with only the LaserWriter Select 360, although Sonic's documentation indicates that it works with all printers.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

Macintosh Easy Open: MS Word Not Showing In List (7/95)

Revised: 7/27/95
Security: Everyone

Macintosh Easy Open: MS Word Not Showing In List (7/95)

Article Created: 8 June 1995
Article Reviewed/Updated 27 July 1995

TOPIC -----

I am having problems opening MS-DOS document files on a Novell Server using AppleShare and Macintosh Easy Open. All of the files I am trying to open are text files, and when I double-click on the documents, the Macintosh Easy Open dialog appears. However, the list in the dialog box does not include Microsoft Word. Microsoft Excel is listed, and I can open the documents with Microsoft Excel through the Macintosh Easy Open dialog, or by dragging and dropping the files on Microsoft Word. Why is Microsoft Word not a choice in the Macintosh Easy Open dialog?

DISCUSSION -----

In testing this problem, I installed Microsoft Word on a PowerBook 520c and a Performa 636. Microsoft Word would show up in the Macintosh Easy Open list when trying to open 'TEXT' files. However, when I rebuilt the desktop, Word was no longer in the list of applications. I deleted Word, rebuilt the desktop and reinstalled Word. Word appeared in the list of applications again. The installer for Word adds the information it wants to the desktop database which is why Word appears in the application list. However, when the desktop is rebuilt, Macintosh Easy Open adds additional information and Word no longer appears in the list.

The reason Translation Manager (Macintosh Easy Open) behaves like this is because it only uses the 'FREF' resources if the application does not have an 'open' resource. Macintosh Easy Open uses two new resources. These are the 'open' and 'kind' resources.

The 'open' resource is supposed to contain a list of file types that the application can open without any external help, like MacLinkPlus. Another purpose of the 'open' resource is to allow an application to have custom icons for files that it does not want the user to open and prevents the Finder from launching the application when the user tries to open one of these documents.

For example, an application can have a settings file with a custom icon by putting the type of the settings file in the 'FREF' and 'BNDL' resources but by not putting the type in the 'open' resource, the Finder does not launch the application if the user tries to open the settings file.

The 'kind' resource contains kind strings the Finder displays. For example, the kind string for a read only SimpleText document is "SimpleText read-only document."

Some applications have a 'FREF' resource for files of type '*****'. This is wildcard file type and means any file can be dropped on the application. However, in the 'open' resource, Macintosh Easy Open treats this as a file type and not a wild card type. Microsoft Word's 'open' resource only contains the '*****' file type. For example, when attempting to open a file with a creator type of '*****', Word shows up in the Macintosh Easy Open application list. However, when attempting to open a file with a creator type of 'ZZZZ', Microsoft Word was not in the list of applications.

According to the Macintosh Easy Open engineer, having only '*****' in the 'open' resource is a mistake. However, the Translation Manager documentation does not indicate if '*****' is a valid file type; there is no mention of wild card file types. Wild card file types are described in the Finder Interface documentation.

It appears Microsoft thought that by putting the wild card file type in the 'open' resource, Word would show up in the list no matter what file the user was trying to open. However, Macintosh Easy Open does not support wild card file types. Other applications have the '*****' type in the 'open' resource but they also have other types as well. Microsoft Word seems to be the only application that has only the '*****' type in the 'open' resource. Please contact Microsoft at (206) 454-2030 for additional help with this problem.

Global Village Modems: Frequently Asked Questions (4/97)

Revised: 4/3/97
Security: Everyone

Global Village Modems: Frequently Asked Questions (4/97)

=====

Article Created: 8 June 1995
Article Reviewed/Updated: 02 April 1997

TOPIC -----

This document contains the answers to frequently asked questions (FAQ) about Global Village modems, which are bundled with Macintosh Performa computers.

Questions In This FAQ:
=====

- 1) Did my Macintosh Performa computer come with software that lets me connect to a local bulletin board system (BBS)?
- 2) I have a TelePort Bronze modem, and it does not appear to receive faxes. What should I do?
- 3) Can I upgrade my TelePort Bronze to a faster modem?
- 4) Where can I obtain the Global Village 2.5 upgrade, and what does it do?
- 5) I am having trouble connecting to my internet service provider with my PPP and SLIP utilities. How can I correct this?
- 6) I bought a new fax modem, and I get an error message stating the serial port is in use whenever I try to use America Online or try to fax. What should I do?
- 7) I would like to receive faxes, but do not want to leave the computer on. Can I do this?
- 8) Question: I want to use my Global Village modem with SoftWindows. Can I do this?

DISCUSSION -----

- 1) Question: Did my Macintosh Performa computer come with software that lets me

connect to a local bulletin board system (BBS)?

Answer: All Performa computers come with a "Works" style package, such as ClarisWorks, Microsoft Works, Symantec Greatworks, or WordPerfect Works. These applications include a terminal emulator, usually under the heading of "communications". They let you use your Macintosh computer as a terminal. See your "Works" documentation for more information. There are also many software packages available commercially and as shareware on online services, such as CompuServe and America Online as well as Internet Web sites such as <<http://shareware.com/>>

2) Question: I have a TelePort Bronze modem, and it does not appear to receive faxes. What should I do?

Answer: Your modem is capable of receiving faxes, but your computer must be equipped with software that can support this capability. Your computer currently comes with a "send only" capability. The "receive" fax capability is sold and supported directly by Global Village. Please contact their sales department at 800-736-4821 for sales and additional information on this product.

NOTE: All Macintosh Performa 6100 series computers, the Performa 637, and the Performa 560 come with a "receive" capability as part of the software bundle. The following computers are in the Macintosh Performa 6100 series: Performa 6110, Performa 6112, Performa 6115, Performa 6117, and Performa 6118.

3) Question: Can I upgrade my TelePort Bronze to a faster modem?

Answer: Global Village offers an upgrade program for Performa customers. For more details, call their sales number at 800-736-4821.

4) Question: Where can I obtain the Global Village 2.5 upgrade, and what does it do?

Answer: Global Village sells this upgrade directly to their customers for a nominal fee. You need to call their sales number at 800-736-4821 for pricing and specifications.

5) Question: I am having trouble connecting to my internet service provider with my PPP and SLIP utilities. How can I correct this?

Answer: If the modem works in other respects, such as connecting to online services, BBSs, or as a fax modem, then the difficulty is likely caused by the configuration of the Internet software. You should contact your internet service provider for support in configuring the software.

6) Question: I bought a new fax modem, and I get an error message stating the serial port is in use whenever I try to use America Online or try to fax. What should I do?

Answer: The modem port can only be in use by one application at a time, so you need to make sure that no other program (such as America Online) is currently running. If the problem persists, the old fax software may be conflicting with your new software. To correct this, you should remove the old fax software and restart.

- If you have a Global Village TelePort Bronze, the old software is stored here:

- System Folder: Apple Menu Items: Fax Center
- System Folder: Extensions: GlobalFax
- System Folder: Control Panels: TelePort/Bronze (called "Fax Modem" on some computers)
- System Folder: GlobalFax Files
- System Folder: GlobalFax Personal

- If you have a Global Village TelePort Gold II, the software is stored here:

- System Folder: Apple Menu Items: Fax Center
- System Folder: Control Panels: TelePort Serial
- System Folder: Extensions: Global Village Toolbox
- System Folder: Extensions: GlobalFax
- System Folder: GlobalFax Files
- System Folder: GlobalFax Personal

NOTE: "GlobalFax Files" contains any faxes you may have sent with the Global Village modem. You may wish to retain that folder, and Fax Center, so you can review any messages you may have sent if necessary.

If you move all of the above files to a single folder, they are "de-activated" by the system software after you restart. There is no need to throw them away, unless you want to reclaim the hard disk space. If you throw them away, make sure you have made a backup of the software or your System Folder. If this does not solve the problem, it could be a configuration issue with your third-party software, and you should contact the manufacturer for support.

7) Question: I would like to receive faxes, but do not want to leave the computer on. Can I do this?

Answer: No. The computer must be on and the fax software must be loaded in order to receive faxes.

8) Question: I want to use my Global Village modem with SoftWindows. Can I do this?

Answer: The modem itself works with SoftWindows or the DOS Compatibility Card. In fact, the hardware works on any type of computer you can physically connect the modem to. However, the Global Village software does not work under MS-DOS/Windows. If you want to use the modem on some other type of modem other than a Macintosh computer, you need to use different software.

Apple MessagePad: Different Types of Reset (7/95)

Revised: 7/19/95
Security: Everyone

Apple MessagePad: Different Types of Reset (7/95)

Article Created: 8 June 1995
Article Reviewed/Updated: 19 July 1995

TOPIC -----

What are the different types of reset on the Apple MessagePad?

DISCUSSION -----

There are four types of reset on the Apple MessagePad; Soft Reset, Power Reset, Hard Reset, and Cold Boot. Instructions for performing all four types of resets are included below.

Soft Reset
=====

A Soft Reset resets the Newton OS. It does NOT erase any data or handwriting training on the Apple MessagePad. However, you should check the Time in the Date and Time Prefs preferences file. The clock in the Apple MessagePad may lose some time when you press the Reset button.

Step 1
Press and release the Reset button in the battery compartment for two seconds.

Step 2
If the Apple MessagePad is on, it restarts itself. If the MessagePad is off, it turns itself on.

Power Reset
=====

A Power Reset resets the Newton OS and the Power Manager. No user data, Preferences, or handwriting training is erased.

Step 1

Press and hold down the Reset button in the battery compartment.

Step 2

Continue holding the Reset button and pull down on the power switch. Continue holding the Reset button down for 2 more seconds.

Step 3

Release the Reset button, and continue holding the power switch down until a dialog box appears asking: "Do you want to erase data completely?"

Step 4

Tap on the "No" button.

Hard Reset

=====

A Hard Reset erases all data in the internal memory. Pen alignment is required the next time you use your Apple MessagePad. In addition to pen alignment, the Time Zone, Date, Time, and Prefs need to be set up. Any System Update installed is NOT erased.

WARNING: You should backup your data prior to a Hard Reset.

Step 1

Remove any PCMCIA storage card that may be in the MessagePad.

Step 2

Press and hold down the Reset button in the battery compartment.

Step 3

Continue holding the Reset button and pull down on the power switch. Continue holding the Reset button down for 2 seconds.

Step 4

Release the Reset button, and continue holding the power switch down until a dialog box appears asking: "Do you want to erase data completely?"

Step 5

Tap on the "Yes" button when it asks to erase data. This erases all user data in the internal memory and sets the Newton OS back to factory defaults.

Cold Boot

=====

A Cold Boot erases all data, any System Update installed, and sets the Newton OS back to factory defaults. There are two methods to do this.

WARNING: You should backup your data prior to a Cold Boot.

Method 1

Step 1

Disconnect any AC power.

Step 2

Remove the main batteries.

Step 3

Remove the round Lithium backup battery.

Step 4

Hold the power switch down for 5 seconds.

Step 5

Release the power switch.

Step 6

Repeat steps 4 and 5 four more times.

Method 2

Step 1

Disconnect any AC power.

Step 2

Remove the main batteries.

Step 3

Remove the round Lithium backup battery.

Step 4

Let the Apple MessagePad sit this way for 15 minutes.

NOTES:

- On a MessagePad 120: No data is erased since data is stored in the internal non-volatile Flash RAM.
- On the MessagePad 120, a Cold Boot resets the Power Manager. Pen alignment is required on the next use.
- The Time Zone, Date, Time, and Prefs need to be set up.

Power Macintosh 9500 Series Video Card:Max. Color Depths (11/96)

Revised: 11/22/96
Security: Everyone

Power Macintosh 9500 Series Video Card:Max. Color Depths (11/96)

=====

Article Created: 8 June 1995
Article Reviewed/Updated: 22 November 1996

TOPIC -----

Some Power Macintosh 9500 series computers include an accelerated display card based on the mach64 graphics accelerator from ATI Technologies, Inc. Higher color depths can be obtained in high resolution modes by upgrading from 2 MB to 4 MB with a 2 MB VRAM upgrade module.

DISCUSSION -----

The following table defines the maximum color depths available for a given resolution and memory size.

Begin_Table

	Resolution	Max Colors 2 MB VRAM*	Max Colors 4 MB VRAM*
	-----	-----	-----
12-in. Monochrome	640x480	256	256
12-in. RGB**	--	--	--
13-in. Color	640x480	Millions	Millions
15" Portrait monochrome	640x870	256	256
16-in. Color	832x624	Millions	Millions
Multiple Scan 15	640x480	Millions	Millions
	832x624	Millions	Millions
Multiple Scan 17	640x480	Millions	Millions
	832x624	Millions	Millions

	1024x768	Thousands	Millions
19-in. RGB	1024x768	Thousands	Millions
Two-Page Monochrome Monitor (21-in.Mono)	1152x870	256 grays	256 grays
21-in. Color	1152x870	Thousands	Millions
Multiple Scan 20	640x480	Millions	Millions
	832x624	Millions	Millions
	1024x768	Thousands	Millions
	1152x870	Thousands	Millions
	1280x1024	256	Thousands
VGA	640x480	Millions	Millions
SVGA	800x600	Millions	Millions
VESA Standard Modes	800x600	Millions	Millions
	1024x768 60Hz	Thousands	Millions
	1024x768 70Hz	Thousands	Millions
	1280x1024 60Hz	256	Thousands
	1280x1024 75Hz	256	Thousands

End_Table

*256 = image depth of 8 bits, thousands = image depth of 16 bits,
millions = image depth of 32 bits.

**The Macintosh 12-in. RGB display cannot be used with the Power Macintosh 9500 series.

NOTE:

The "Technical Information: Specifications for Power Macintosh 9500 Series Computers" booklet that ships with the Power Macintosh 9500 contains some minor inaccuracies:

- The Macintosh 12-in. RGB display is incorrectly listed as compatible.
- The maximum color depth at 1280x1024 with 2 MB of VRAM is 256 colors.
- The maximum color depth at 1024x768 with 2 MB of VRAM is "Thousands."

IMPORTANT NOTE:

To order a VRAM memory module upgrade please call ATI Technologies, Inc. This upgrade is not available from Apple Computer, Inc. It is not supported or serviced by Apple Computer, Inc. At the time of this writing the 2 MB VRAM upgrade was ATI part number 100-31602-00. This information is subject to change. Please call the vendor for changes and details.

Turn Virtual Memory Off Message and RAM Doubler (6/95)

=====

Article Created: 8 June 1995
Article Reviewed/Updated: 28 June 1995

TOPIC -----

When I launch some of my programs (The 7th Guest, and Myst for example) I'm shown a dialog box requesting me to turn virtual memory off. When I checked the Memory control panel, virtual memory is already off. What could be causing this?

DISCUSSION -----

Check to see if you are using RAM Doubler by Connectix. Many of the functions of RAM Doubler are similar to the way virtual memory operates. A temporary workaround is to remove RAM Doubler from your Extensions folder and restart. You should contact Connectix for further information about RAM Doubler.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Explicit and Inherit Access Privileges Defined (7/95)

=====

Article Created: 9 June 1995
Article Reviewed/Updated: 27 July 1995

TOPIC -----

I've seen explicit and inherit access privileges with AppleShare File Servers, what do these mean.

DISCUSSION -----

The terms explicit and inherit are commonly used when referring to access privileges with AppleShare File Servers. Here are definitions for explicit and inherit access privileges:

Explicit

Retain access privileges regardless of the enclosing folder.

Inherit

Always change to reflect access privileges of enclosing folder.

Defaults

The default on an AppleShare File Server is explicit access privileges. The default on Personal File Sharing is explicit access privileges.

Eidetic Newton Utilities: Brief Description (6/95)

=====

Article Created: 9 June 1995

TOPIC -----

The following is a brief description of Eidetic Newton Utilities which is available on both Macintosh and Windows diskettes.

DISCUSSION -----

Eidetic Newton Utilities helps the user move information directly from the internal RAM to storage cards and back with the Software Manager. The user may also boost memory instantly with Memory Manager. It also provides users with Shortcuts.

Eidetic Newton Utilities is a StarCore product. Support for this software used with an Apple MessagePad is provided by the Apple Assurance Newton Support Group at 1-800-SOS-APPL (767-2775).

Color LaserWriter 12/600 PS: New Windows Parallel Cable (12/95)

Revised: 12/14/95
Security: Everyone

Color LaserWriter 12/600 PS: New Windows Parallel Cable (12/95)

=====

Article Created: 9 June 1995
Article Reviewed/Updated: 14 December 1995

TOPIC -----

The Color LaserWriter 12/600 PS specification sheet lists a 1284 Parallel I/O cable (M4235M/A). Do I need this cable, or can I use a "standard" parallel cable? Also, how what is the length of this cable?

DISCUSSION -----

You cannot use the old style parallel cable. The parallel interface on the Color LaserWriter 12/600 PS controller side is new. The physical connector is different from the old style parallel port. The Color LaserWriter 12/600 PS uses a IEEE-1284 cable, this cable is not interchangeable with the older style parallel cables.

The old style parallel cables used a 1284-A style plug, which use a 1284-B connector. The Color LaserWriter 12/600 PS controller uses the newer 1284-C style connector. This new connector fully supports the 1284 ECP transfer mode (Fast mode), which is why Apple uses it.

There may be some third-party adapters that will allow you to convert the older 1284-B to the newer 1284-C connector. However, Apple will not support such a configuration.

The 1284 Parallel I/O cable (M4235M/A) is 10-feet in length, if you need longer length cables, you will need to find a third-party vendor who sells IEEE-1284 compliant cables.

This article was publised in the "Information Alley":

Power Macintosh 9500 Series: Drive Setup Information (6/95)

Revised: 6/21/95
Security: Everyone

Power Macintosh 9500 Series: Drive Setup Information (6/95)

=====

Article Created: 9 June 1995
Article Reviewed/Updated: 21 June 1995

TOPIC -----

This article contains information on how Logical Unit Numbers (LUNs) are used in the Drive Setup software included on Power Macintosh 9500 series computers.

DISCUSSION -----

There are a number of columns on the setup window listing drive SCSI, BUS number, and one listing LUN .

LUN (Logical Unit Number)
=====

This column identifies the Logical Unit Number of the device on the bus. For SCSI this could range from 0 - 16. This column is undefined for IDE since IDE does not implement LUNs.

In SCSI each target ID may have 8 logical units which are LUNs. The range of SCSI target ids is 0-7 for all SCSI busses implemented in Macintosh hardware today. If a user has a third-party SCSI card installed which implements 'Wide SCSI' then the target ID range can be from 0 to 16.

MacTCP: Not Installed or Disabled Error (6/95)

Revised: 6/9/95
Security: Everyone

MacTCP: Not Installed or Disabled Error (6/95)

=====

Article Created: 9 June 1995

TOPIC -----

Why does my application indicate MacTCP is not installed or disabled?

DISCUSSION -----

Many applications will report that MacTCP is not installed or that it has been disabled if the connection attempt via MacTCP fails. This could be due to a variety of reasons.

First verify that the network you are connected to supports MacTCP. Next, the configuration information for the MacTCP control panel should be verified with your TCP/IP network administrator or internet service provider. If PPP or SLIP is being used, you would also need to verify that those components are in working order. If all this has been verified and the error still occurs, you may want to try making a connection with another application like MacTCP Ping.

MacX and Display Postscript (6/95)

Revised: 6/9/95
Security: Everyone

MacX and Display Postscript (6/95)

=====

Article Created: 9 June 1995

TOPIC -----

I'd like to use MacX on my Macintosh to do work on our various UNIX machines. Most systems seem to work, but I can't get certain programs from the Suns to work.

DISCUSSION -----

Solaris 2.3 has support for display postscript, and applications that use display postscript write directly to the screen bypassing the X windows interface in OpenLook. Because X windows is not used, the screens can not be drawn over the network onto a MacX window server. This is not a limitation of MacX, but of all X terminals, including Suns SPARCclassic X terminals which have the same behavior.

The manual, "Desktop SPARC: Using a SPARCclassic X Terminal", provides some examples of this restriction. They are the pageview application; the viewing of Postscript files from within File Manager and Mail Tool; and the usage of Solaris AnswerBook documentation and Help Viewer.

Japanese Language Kit 1.2: Description and Specifications (6/95)

Revised: 6/16/95
Security: Everyone

Japanese Language Kit 1.2: Description and Specifications (6/95)

=====

Article Created: 12 June 1995

TOPIC -----

The Japanese Language Kit (JLK) 1.2 is the latest version of Apple software that allows users to display, input, edit and print Japanese documents on their Mac OS computer. The software is intended for Japanese language educators and students, multinational businesses, and bilingual home users.

The following article contains a description of JLK 1.2 and lists its hardware and software requirement specifications.

DISCUSSION -----

Overview

=====

The Apple Japanese Language Kit contains everything you need to easily add Japanese to your documents. The kit can be used with your Apple Macintosh computer to run Japanese applications and include Japanese text in letters, presentations, and reports. You can even work with files created using KanjiTalk, Apple's Japanese version of the Macintosh operating system.

Whether you are a desktop publisher or business professional, you can use the Language Kit to create materials such as brochures, posters, business cards, presentations, and restaurant menus in Japanese. Students and teachers can use it to run interactive Japanese-language programs and produce compelling term papers in Japanese. Although the Japanese Language Kit does not translate text, it does let you easily input, edit, and print in Japanese.

The Japanese Language Kit works as an extension to Mac OS software version 7.1 or later. It also allows you to run Japanese applications. Because the Language Kit uses the operating system you already have, there is no need to store an additional system on your hard disk. The Japanese Language Kit also contains Kotoeri, the same easy-to-use input method that is included with KanjiTalk.

Almost every major software program has a version that has been localized for Japanese. All you need to run them is the Japanese Language Kit and System 7.1 or later. You can even use nonlocalized programs that take advantage of WorldScript, such as Nisus Writer, WordPerfect, and WorldWrite. WorldScript simplifies the way in which a single operating system can support multiple languages.

The Japanese Language Kit comes with three Kanji TrueType fonts, that produce high-quality output from any Macintosh compatible printer. Documentation is provided in both Japanese and English, and you can type using either the roman or the kana keyboard layout. These features make the Language Kit easy to use whether you're a native speaker or just learning Japanese.

Technical Specifications

=====

Usage Requirements

- Apple Macintosh computer with at least 5MB of RAM
. (8MB recommended for multiple applications)
- Hard disk with approximately 30MB of disk space available
- Apple SuperDrive (1.4 MB) floppy disk drive or CD-ROM drive
- Apple Macintosh System 7.1 or later
- An application that is localized for Japanese or that uses WorldScript software technology

Printer Support

- Recommended: QuickDraw printers, including the Apple StyleWriter line, the Apple Personal LaserWriter line, and the ImageWriter line
- PostScript-compatible printers, including Personal LaserWriter printers (although PostScript printers can produce Japanese, performance may vary)

System Software Requirements

- The Japanese Language Kit can be used with many nonlocalized programs that employ Apple WorldScript software technology. These programs include, but are not limited to:
 - AllPage
 - AllScript
 - Logo Vista E to J
 - Nisus Writer
 - WinText
 - WorldWrite
 - WordPerfect

NOTE:

Apple has tested a limited number of applications; these lists are not intended to be comprehensive. Many nonlocalized applications that do not employ WorldScript software technology may provide limited functionality and allow input of Japanese characters.

Compatible applications

- The Japanese Language Kit can be used with a variety of applications localized for Japanese. They include:

- Acta 7 J
- Canvas J
- ClarisImpact J
- ClarisWorks J
- Director J
- Eg Word J
- FileMaker Pro J
- FreeHand J
- GreatWorks J
- HyperCard J
- Illustrator J
- Lotus 1-2-3 J
- MacDraw Pro J
- MacWord J
- MacWrite II J
- PageMaker J
- Persuasion J
- Photoshop J
- Premiere J
- QuarkXPress J
- SoundEdit J
- SuperPaint J
- WordPerfect J

Features

=====

Capabilities

- Create documents and presentations in both Japanese and English, or Japanese and other languages supported by your system
- Produce promotional materials, foreign-language textbooks, bilingual educational materials, and more
- Insert Japanese text into letters, presentations, spreadsheets, and other documents
- Boost language learning by using inter-active practice drills and other learning tools

Ease of use

- Installs quickly and easily
- Easily create, edit, and print Japanese
- Comes with an input guide that includes instructions in Japanese and English

Compatibility

- Runs applications that have been localized for Japanese, including

WordPerfect, Aldus Persuasion, FileMaker Pro, and Lotus 1-2-3

- Recommended for all QuickDraw printers; also works with PostScript-compatible printers
- Runs on all Macintosh compatibles; 68020, 68030, and 68040 processor-based computers; and Power Macintosh computers

Flexibility

- Comes with three Kanji TrueType fonts: HonMincho, MaruGothic, and Osaka
- Lets you display, edit, and print files created using KanjiTalk, the Japanese version of the Macintosh operating system

Ordering Information

=====

Japanese Language Kit (Order No. M1648Z/C)

- Japanese Language Kit on thirteen 1.4 MB floppy disks and CD
- WorldScript II system extension
- Japanese Language Kit Installation and User's Guide
- Macintosh Japanese Input Method Guide

At Ease 3.0: Read Me (11/95)

Revised: 11/7/95
Security: Everyone

At Ease 3.0: Read Me (11/95)

=====

Article Created: 12 June 1995
Article Reviewed/Updated: 7 November 1995

TOPIC -----

The following article is the ReadMe file for At Ease 3.0.

... PLEASE NOTE THE INFORMATION ENCLOSED IN BULLETS "..." IS NOT PART OF THE ORIGINAL READ ME FILE BUT HAS BEEN ADDED HERE TO CLARIFY SOME OF THE PROCEDURES DESCRIBED IN THE ORIGINAL READ ME FILE. ...

DISCUSSION -----

This document reflects the latest information on At Ease version 3.0. Please read this document carefully. The software may have changed slightly since the manual was printed.

Installing At Ease
=====

You should use the Installer program to install At Ease. Do not attempt to install At Ease by dragging files onto your hard disk. The Installer places the files in the correct locations on the disk.

Before using the At Ease Installer program, make sure you have quit all other application programs. If you have trouble installing, temporarily turn off all extensions by holding down the Shift key while you restart your computer. Then try installing again.

If you install At Ease 3.0 on a computer running system software version 7.0 or 7.1 and you later install version 7.5 on your computer, use the Custom Install option of the At Ease Installer to install the At Ease Guides.

Installing Mouse Practice
=====

If your version of At Ease came with Mouse Practice, install it immediately after installing At Ease.

Removing At Ease =====

If you decide to remove At Ease, use the At Ease Installer program. Never attempt to remove At Ease from your System Folder while At Ease is turned on. See the manual for more information on removing At Ease.

Getting Help in At Ease =====

In addition to the manual and this Read Me file, there are several ways of obtaining online help in At Ease.

Apple Guide (System 7.5 Users) -----

If you are using system software version 7.5 or later, you can use Apple Guide to get instructions for using At Ease. At Ease Guide, the Apple Guide for the At Ease panels, is available from the Guide menu whenever At Ease is the active application program. At Ease Setup Guide, the Apple Guide for the At Ease Setup program, is available from the Guide menu whenever At Ease Setup is the active program.

At Ease Setup Help (System 7.0 or 7.1 Users) -----

If you are using system software version 7.0 or 7.1, At Ease includes online help for the At Ease Setup program. To use At Ease Setup Help, click the question mark button that appears on each page of the At Ease Setup program.

Balloon Help -----

Balloon Help is available for almost every function of At Ease. To activate Balloon Help, choose Show Balloons from the Guide menu (system software version 7.5) or the Help menu (system software version 7.0 or 7.1). When you are finished using Balloon Help, choose Hide Balloons from the Guide menu or Help menu.

Upgrading From Earlier Versions of At Ease =====

For most upgrades, your administrator password (if you had one) will remain the same in the At Ease Setup program in version 3.0. When the At Ease Setup program asks for an administrator name, type "At Ease Administrator," which is the default administrator name.

Upgrading From Version 1.x -----

If you are upgrading from At Ease version 1.x to version 3.0, you must first remove the old version by using the At Ease Installer program that came with the old version. When the Installer screen is displayed, hold down the Option key to change the Install button to Remove. Then click Remove to remove the old version.

... The information above is incomplete. The correct procedure to remove At Ease 1.0 is:

Step 1

Double-click the At Ease 1.0 Installer.

Step 2

Click OK to pass the "Welcome to the At Ease Installer".

Step 3

Click on the Customize button.

Step 4

Select At Ease in the window on the left.

Step 5

Hold down the option key to change the Install button to a Remove button. ...

Any items you created in version 1.x are automatically assigned to a setup or user named At Ease 1.0.

Upgrading From Version 2.x

Upgrading from version 2.x to version 3.0 occurs automatically when you first run the At Ease Setup program of version 3.0. At Ease turns itself off at the end of the installation process, so you must run the At Ease Setup program to turn At Ease back on.

... The information above is incomplete. It should state that:

To update At Ease 2.x machines to At Ease 3.0, you must first follow the normal installation process. You should first startup your computer with extensions off by holding down the shift key while starting your Macintosh until it says "Welcome to Macintosh, Extensions Off". Run the installer program from the installer disk. ...

Installing Other Programs While Running At Ease

=====

You should not install programs onto your hard disk while running At Ease. Before you install programs, turn At Ease off in the At Ease Setup program and

restart your computer. When you finish installing programs, turn At Ease back on and restart the computer again. Programs you install onto your hard disk are not automatically added to At Ease setups or users; you must use the At Ease Setup program to provide access to the new programs.

If some program buttons are not displayed properly in At Ease after you install new software, you should rebuild your desktop. To do so, turn At Ease off and restart your computer. While the computer is restarting, hold down the Command and Option keys until you see a message asking whether you want to rebuild the desktop file. Click OK. When the computer has finished starting up, turn At Ease back on in the At Ease Setup program and restart the computer again.

Restricted Finder Users =====

There are several things you should know about the restricted Finder environment.

Security in the Restricted Finder -----

In trying to maintain compatibility with other programs, the restricted Finder environment can sometimes allow programs to bypass some of the security features you selected in the At Ease Setup program. If programs you use seem to pose security problems, you may want to remove them from your hard disk.

Security is maintained for restricted Finder users by creating a list of "approved" application programs, desk accessories, and control panels that can be opened by the user. This list includes

- all items in the current setup folder
- items in the Apple Menu Items folder (if you have given access to them)
- the Chooser (if you have given access to it)
- the Print Monitor
- items in the Startup Items folder (only if the setup will open them)
- items in the Shutdown Items folder
- items in the Control Panels folder (if you have given access to them)
- the At Ease Setup program (administrator password required)
- approved sub-launched programs (for more information, see "Sub-Launching Programs" later in this Read Me file)

If a document exists in any of these places, the application that created the document can also be opened.

The At Ease Setup program can always be opened because the administrator password restricts access.

The list of approved programs does not include programs in the user's own documents folder. (If it did, a user could copy a program from a floppy disk to his or her documents folder and attempt to open it without permission.)

Macintosh Guide and the Restricted Finder -----

Because of changes in the Finder made for restricted Finder users, instructions in Macintosh Guide (available from the Guide menu in system software version 7.5 or later) may not always be accurate. For example, when users who do not have access to control panels use Macintosh Guide to request instructions on adjusting the sound volume, they will not be able to complete the required steps.

Desktop Items and the Restricted Finder

When a user connects to (mounts) a disk other than the startup disk, items on the desktop of the disk are placed in a folder called "Items for Desktop," located at the top level of that disk. When the user disconnects from (unmounts) the disk, the items are not replaced on the desktop.

Copying in the Restricted Finder

If a user drags a folder for which he or she doesn't have access (such as another user's folder) into his or her own folder, the computer will not copy any files from the dragged folder, but it will add an empty folder of the same name to the hierarchy for the user's folder.

File Sharing and the Restricted Finder

File sharing does not work with the restricted Finder. When a restricted Finder user logs in, At Ease turns off file sharing. The next regular Finder user who logs in and wants to use file sharing must return to the Sharing Setup control panel and turn file sharing on again.

Do not use file sharing on computers that will be updated via the Update Computers command in At Ease Setup.

RAM Disks and the Restricted Finder

Do not use RAM disks if any user works in the restricted Finder; doing so may cause your computer to crash.

Sub-Launching Programs

=====

Sub-launching is the process by which one program opens another program (called a subprogram) without the user having directly opened the subprogram. The security features of At Ease can sometimes interfere with a program's ability to sub-launch necessary subprograms. When a program attempts to sub-launch a subprogram to which a user has not been given access, the computer will usually display a -5000 error code.

There are two ways to allow programs to sub-launch the subprograms they need. In either case, the subprogram bypasses the security that At Ease provides.

- In the At Ease Setup program, open the Settings menu and choose Application Preferences. Add the necessary subprograms to the list, and then select each subprogram and click the checkbox labeled "Can be launched by other

applications." This setting applies to all users and setups, so you need to follow this procedure only once. You should be aware that this setting allows all users—including restricted Finder users—to open the subprogram.

- In the At Ease Setup program, give access to all the necessary subprograms. This procedure allows you to specify which users or setups have access to the subprograms. The disadvantage of this procedure, however, is that users see a button for each subprogram even though they normally won't need to open the subprograms directly.

At Ease 3.0 and Kid Pix Studio

Kid Pix Studio sub-launches each subprogram a child uses. But because of a software incompatibility, At Ease does not view these subprograms as application programs. To allow Kid Pix Studio to sub-launch its subprograms successfully, choose Application Preferences from the Settings menu of At Ease Setup and click the Custom button in the screen that appears. In the Custom Add screen, add each of the following subprograms:

Begin_Table

Name	File Creator
-----	-----
KPS 0	Kîd0
KPS 1	Kîd1
KPS 2	Kîd2
KPS 3	Kîd3
KPS 4	Kîd4
KPS 5	... Kîd4

This information is incorrect the original Read Me states to type Kîd4 again for the KPS 5 name, it should read Kîd5 ...

End_Table

To type the î character in the file creator names, hold down the Option key while you type the letter i, then release the Option key and immediately type the letter i again.

For more information on using the Custom Add screen, see "Application Preferences" later in this Read Me file.

At Ease 3.0 and Control Panels

=====

Users who start out in the At Ease panels and switch to the Finder may experience problems when opening control panels. If they choose Control Panels from the Apple menu of the Finder, the Control Panels folder appears as expected. If they choose a particular control panel from the Control Panels submenu, however, they are returned to the At Ease panels. In most cases, the selected control panel appears in front of the At Ease panels. But for certain

control panels, such as the Extensions Manager in system software version 7.5, a message appears saying that the selected control panel can't be opened in At Ease.

To avoid these problems, At Ease users who switch to the Finder should not use the Control Panels submenu. Instead, they should choose Control Panels from the Apple menu of the Finder and then double-click the control panel they want in the Control Panels window that appears.

At Ease 3.0 and CD-ROM Discs =====

At Ease can display only one CD-ROM panel at a time. If a user inserts another CD-ROM disc to which he or she has access, a message appears indicating that the disc can be accessed using buttons. If the user ejects the first CD-ROM disc, the second CD-ROM disc appears as a panel.

The CD-ROM Preferences feature does not work properly with audio CDs.

At Ease 3.0 and the Find File Feature in System 7.5 =====

While At Ease is running, Find File finds only those items in locations to which the user has complete access, including the user's documents folder and the Trash folder. Most other locations (including server volumes and the user's setup folder) do not return any information when Find File is used.

At Ease 3.0 and the Startup Items Folder in System 7.5 =====

Any item in the Startup Items folder will be opened at startup, even if you didn't give the user access to the item or to the program used to create it. If you don't want all users to have access to an item, don't place the item in the Startup Items folder.

Application Preferences =====

The Custom button in the Application Preferences screen should be used only when At Ease security settings are interfering with a program's ability to sub-launch other programs that it needs and the "Can be launched by other applications" setting doesn't solve the problem. It is very unlikely that you will need to use the Custom button.

When you click the Custom button, the Custom Add screen appears. You provide a name (which can be anything you like, since it's needed only for display in the list of applications) and the file creator for each subprogram you are having difficulty sub-launching. You must type the file creator exactly, including any spaces and special characters. (You can usually get the name of the file creator

from the developer of the software.)

The Custom button also allows you to remove programs from the Application Preferences list—even programs that you added to the list using the Add Other button. To do so, click a program's name in the list and click the Custom button. If the Custom Add screen does not already include a name and file creator for the program, type the program's name (exactly as it appears in the list) and its file creator. Then click Remove.

Database Consistency Checking

=====

At Ease 3.0 uses a sophisticated database for handling user information. If a problem is detected, the At Ease Setup program alerts the administrator and asks whether it should verify the database files. When the verification is complete, a file called Consistency Check Report appears on the startup disk.

The administrator can also manually start the verification process by holding down the Command key while starting the At Ease Setup program.

At Ease 3.0: Description and Specifications (8/95)

=====

Article Created: 12 June 1995
Article Reviewed/Updated: 14 August 1995

TOPIC -----

The following article contains a description and list of technical specifications for At Ease 3.0.

DISCUSSION -----

Overview
=====

Now there is a simple, effective, and inexpensive way to share your family Macintosh—while protecting important applications and documents.

Only At Ease 3.0 software from Apple Computer offers this security with a choice of interfaces for every age and experience level. For younger learners and computer novices there is the friendly At Ease desktop. It features large buttons, that can speak, for accessing files and applications, and large folders for keeping everything organized. It lets children work and play independently with-out your worrying about accidental damage to your files.

Older children can use the standard Macintosh Finder interface, but still under At Ease management to prevent access to unauthorized applications and documents. Finally, you and anyone else you authorize can bypass At Ease and gain access to all of the computer's files and capabilities. At Ease keeps pace with every member of your family.

Each At Ease user has one folder containing approved applications, files, and other items; and one folder for the user's own documents. In version 3.0, each CD or floppy disk also conveniently appears in its own folder. Easy-to-use setup menus let you quickly designate which desktop each person will use and which applications and documents they can open. Adding an item to a user's folder is quick and easy. You can also control permissions for deleting, copying, and renaming specific files, and you can create a list of allowable CDs to ensure

that users access only permitted materials.

Because At Ease software comes from Apple Computer, you are assured that it is designed to work smoothly with your Macintosh. At Ease can be used not only at home, but also on shared, non-networked Macintosh systems in classrooms, small businesses, libraries, and museums. With At Ease 3.0, you can feel good about sharing your family Macintosh.

Technical Specifications

=====

Usage requirements

- Apple Macintosh, PowerBook, or Power Macintosh computer
- 4 MB of RAM
- Macintosh system software version 7.0 or later
- Hard disk
- Apple SuperDrive 1.4 MB floppy disk drive

Access levels

- At Ease desktop
- Restricted Finder
- Normal Finder

File and media access

- Manage access to:
 - Applications
 - Documents
 - Hard disk
 - Apple Menu items (desk accessories, Chooser, and control panels)
 - CDs
 - Floppy disks
- Assign separate permissions for opening, copying, deleting, and renaming files

CD access

- Contents of each disc appear in a separate At Ease folder
- List of allowable CDs can be created
- Within the At Ease desktop, specific portions of a disc can be locked out

Floppy disk access

- Contents of each floppy disk appear in a separate At Ease folder
- Application-launching from floppy disks can be disabled

File-saving options

- Users can save documents to a floppy disk and to a private folder on the local hard disk

- Document-saving can be disabled

Easy setup and maintenance

- Setup application provides easy-to-use configuration screens for designating users, items, menus, file locations, and other options
- Apple Guide support gives Macintosh System 7.5 users step-by-step context-sensitive help for using the At Ease desktop and the setup application

Features

=====

Flexibility

- Simplified At Ease desktop for young or inexperienced users
- Restricted Finder interface for experienced users
- Normal Finder interface for authorized full-access users
- Separate At Ease folder for each CD or floppy disk
- Support for up to 40 different users

Security

- Designate access to specific applications and documents
- Specify privileges for opening, copying, deleting, and renaming particular files
- Assign individual user passwords
- Authorize the use of individual CDs and their contents
- Block access to the hard disk
- Prevent applications from being launched from floppy disks
- Protect system settings, control panels, and the Chooser

Ease of use

- Large one-click buttons to access files and applications from the At Ease desktop
- Fast, simple installation and setup
- Talking buttons for non-readers or those just learning to read
- Single folder for organizing personal documents

Ordering Information

=====

At Ease 3.0 (Order No. M1859Z/D)

- At Ease software
- Owner's manual

Apple also offers At Ease for Workgroups software for networked systems; contact your Apple sales representative or reseller for more information.

Product specifications are subject to change. Check with your Apple reseller for the most current information about product specifications and

configurations.

CD-ROM: This disk is unreadable Message (9/95)

Revised: 9/1/95
Security: Everyone

CD-ROM: "This disk is unreadable" Message (9/95)

Article Created: 12 June 1995
Article Reviewed/Updated: 01 September 1995

TOPIC -----

When I put a CD into my CD-ROM drive I get the message "This disk is unreadable by this Macintosh. Do you want to initialize the disk?" What does this message mean?

DISCUSSION -----

When the CD-ROM drive will not recognize a particular type of CD, this usually indicates the CD-ROM software is not properly installed or is missing certain files. In some cases, the one or several of the CD-ROM "Access" files may be damaged or a third-party extension or control panel may be conflicting with the CD-ROM software. Try the following suggestions to resolve this issue:

- Make sure you have not started your Macintosh with the Shift key held down to turn off extensions, or you are not using any extension manager software that prevents the CD-ROM extensions from loading.
- Make sure that these files are in the Extensions folder of your System Folder:
 - Apple CD-ROM
 - Apple Photo Access (if you plan to use Kodak Photo CDs)
 - Foreign File Access
 - High Sierra File Access
 - ISO 9660 File Access
 - Audio CD Access

If any or all of these files are missing, search your hard disk to see if they have been moved to a different location, then move the files back into the Extensions folder. You will need to restart the computer after moving the files to the Extensions folder for the files to work properly.

- If these files have been deleted, reinstall your system software from your

Macintosh CD or system disk. You need to startup from the CD in order to reinstall the resources properly.

- If these files are damaged, throw the CD-ROM files mentioned above into the Trash, empty the Trash, restart while holding down the Shift key until the message "Welcome to Macintosh, Extensions off" appears. Reinstall the CD-ROM software from your Macintosh CD or system disks. Restart and test to see if the CD mounts on the desktop.
- If the preceding steps fail to resolve your issue, then an extension may be conflicting with the CD-ROM software. If you are running System 7.5 (see Note), open the Extensions Manager control panel and select "System 7.5 Only" from the Sets pull-down menu. When you restart your Macintosh, only the extensions installed with System 7.5 load. Test your CD-ROM disks to see if they work, then add extensions and control panels back one at a time, restarting after adding each one to isolate which extension is causing the conflict.

NOTE: If you are using an earlier version of System 7, you have to manually drag extensions and control panels out of the System Folder and restart each time to isolate the offending file.

Once you isolate the conflicting extension, contact the software manufacturer or vendor for compatibility information, or disable the extension to resolve the symptom.

PC Exchange: How To Turn Off (7/95)

Revised: 7/27/95
Security: Everyone

PC Exchange: How To Turn Off (7/95)

=====

Article Created: 12 June 1995
Article Reviewed/Updated: 27 July 1995

TOPIC -----

If you click the "off" button in PC Exchange and restart, the PC Exchange control panel turns back on. Is there a way to make the on/off button "sticky" through reboots?

DISCUSSION -----

The off button in the PC Exchange control panel is intended for temporarily disabling PC Exchange. If you turn off PC Exchange this way, on restart PC Exchange turns back on.

To disable PC Exchange each time the Macintosh is restarted, Apple recommends using Extensions Manager in System 7.5 to prevent the PC Exchange control panel from loading.

If you are using System 7.1, drag the PC Exchange control panel out of the System Folder before restarting.

System 7.5: What The External CD Sound Extension Does (8/95)

Revised: 8/23/95
Security: Everyone

System 7.5: What The External CD Sound Extension Does (8/95)

Article Created: 12 June 1995
Article Reviewed/Updated: 23 August 1995

TOPIC -----

On the Macintosh 630 family, Power Macintosh 5200/75 LC, Performa 5200, and Performa 6200 series of computers there is an extension called "External CD Sound" in the Apple Extras folder. I have not been able to find anything in my manuals which tells me what it does.

What is this extension used for?

DISCUSSION -----

The External CD Sound extension lets users connect an external CD-ROM drive to these computers and play audio CDs through their internal speakers (see Note).

Without the External CD Sound extension, you are able to select the external CD-ROM drive using the AppleCD Audio Player, but you do not hear the audio. The External CD Sound extension solves this problem.

The following is the text that should be included in the About Apple Extras SimpleText document on these computers.

"External CD Sound: You may need to use this extension if you connect an external CD-ROM drive to your Performa and wish to play audio CD-ROMs using AppleCD Audio Player. To use the External CD Sound extension, drag it from the Apple Extras folder to the Extensions folder."

NOTE: If you want to hear the audio from the external CD-ROM through the internal speakers of the Power Macintosh 5200, you need to use a Y-Adapter cable (not included with the Power Macintosh/Performa) to connect from the external CD drive's RCA audio jacks to the Sound In (Microphone) jack on the back of the Power Macintosh or Performa 5200 computer.

This article was published in the "Information Alley":
Volume II, Issue 7, Page 8

Article Change History:

23 Aug 1995 - Updated to include other computers that ship with the extension.

Power Macintosh DOS Card: Video Sync For LCD Panels (6/95)

Revised: 6/13/95
Security: Everyone

Power Macintosh DOS Card: Video Sync For LCD Panels (6/95)

=====

Article Created: 12 June 1995

TOPIC -----

I'm unable to synchronize the Power Macintosh 6100/66 DOS Compatible in DOS mode when using a variety of LCD panels.

For example, when connected to an nView MediaPro LCD panel in Apple 640x480 mode, both Macintosh and Windows screens display fine, but the panel won't display DOS text at all. When connected in VGA mode, DOS text displays OK, but Macintosh and Windows screens "tear" at the top of the display.

DISCUSSION -----

We took measurements using a digital scope with automated time and frequency calculation. The Power Macintosh DOS Compatibility Card produces timing signals which drive Apple monitors, and includes flexibility to work with non-Apple multiple scan monitors. In some of the Power Macintosh DOS Compatibility Card video modes there are slight timing differences between Macintosh and Windows. This is usually not a problem because most monitors can work within specific timing variances. In other words, if the frequencies are off by a small amount, monitors can still synchronize and provide a stable image.

It was reported that the InFocus LCD would not work with the Power Macintosh DOS Compatibility Card, but after testing with different Macintosh/DOS video modes, we did find a combination that worked (see detail section below). Other reports confirm that the nView and Proxima Ovation panels also work. From what we can tell, some LCD panels on the market are intolerant to small variances in video timing or work within only a specific frequency.

General Suggestions and Background

If possible, test the LCD panel at various video scan rates. When using an LCD panel with the Power Macintosh 6100/66 DOS Compatible computer, test the panel with both the manufacturer provided adapter and no adapter (direct). Using an Enhance video adapter with a multiple scan display lets you test more

configurations and frequencies. You may have to adjust the LCD controls (horizontal and vertical position, sync polarity, and so on) to center the image, remove tearing, or properly synchronize the LCD image. Using an Apple 14-inch display or setting the Enhance video adaptor to "J" is the recommended video timing for Macintosh, DOS, or Windows when connecting to an LCD display.

The following describes the video signaling for different display connections:

- Apple 14-inch display (640x480)

Video modes for Macintosh, DOS, and Windows will be similar but not exactly the same (horizontal = 35 kHz, vertical = 67 Hz).

- Apple 16-inch display (832x624)

Video modes for Macintosh, DOS, and Windows will be similar but not exactly the same (horizontal = 49.75 kHz, vertical = 74.5 Hz).

- VGA (using Enhance video adapter "G")

Video modes for Macintosh and Windows will be similar, but not exactly the same (horizontal = 31.45 kHz, vertical = 60 Hz). DOS will operate at its normal video rate (horizontal = 31.75 kHz, vertical = 71 Hz).

Detail In Using a Power Macintosh DOS Compatibility Card with a Proxima LCD
=====

There are several issues when using a Proxima LCD display panel to project the screen through an overhead projection unit on a Power Macintosh 6100/66 DOS Compatible computer. Below are details as to how the video circuitry on the DOS Compatibility Card works which is necessary to understand what is happening.

There are three monitor settings in the PC Setup control panel, they are 14-inch, 16-inch, and VGA. You can only choose different settings if a multiple scan monitor is being used. If an Apple 14-inch or 16-inch monitor is used, PC Setup automatically picks the corresponding setting and cannot be changed.

If the setting is either 14-inch or 16-inch, the DOS Compatibility Card will generate the same video signals the Macintosh normally uses for those monitors. In other words, if 14-inch is selected, the DOS Compatibility Card will generate video for 640x480 at 67 Hz. This is not VGA video even though the driver selected in Windows is VGA.

Even though the DOS Compatibility Card is generating Macintosh video signals, they are not exactly the same. We looked at the video signals with an oscilloscope and discovered that the timing is the same but the sync pulses change in width. Apparently, this slight variation is not a problem for Apple monitors but it does distort the display on some LCD panels.

If VGA is chosen in the PC Setup control panel, the DOS Compatibility Card will generate true VGA video signals. In this case, switching between the Macintosh and DOS sides causes a major change in the video signals. This VGA setting only works with devices that can switch resolutions while in operation.

Our testing has shown that the best setup with an LCD panel is to use a 14-inch

Apple monitor if the system has a monitor connected along with the LCD panel. If a monitor is not being used, then a video adapter can be used to force the Macintosh into using 640x480 Macintosh video.

The video adapter is hardware that is placed in line between the Macintosh and video cable changing the sense pins the Macintosh sees. The most popular use of these adapters is to use non-Apple monitors with Macintosh systems.

On the DOS Compatible system the adapter should be placed between the cable connected to the monitor and the 4-connector cable that ships with the DOS Compatible system. It needs to be placed in this location because the DOS Compatibility Card actually senses which monitor is connected.

LCD panels behave differently. We have tested the InFocus panel and were able to make it work using a video adapter described above. This panel has a separate box that is used to connect an Apple monitor in line, however we had trouble with it. We could only make the panel work by connecting it directly to the Macintosh.

Success in using the nView panel with a video adapter has also been reported to us, and we have used a Proxima Ovation panel without an adapter and monitor connected, just the panel.

In conclusion, using LCD panels with the DOS Compatibility Card is a little delicate. It can be done with a little patience and experimentation. The setup needed differs depending on the panel being used.

The adapter used by some is available from Sony. The information is listed below. This adapter has a dial and dip switches for configuration. The dip switches should be set 1-6 OFF and 7-9 ON. The dial should be set to position "M", but we also made it work on position "J". We suggest experimenting with the setup well in advance of it's actually being needed because it could take a while to get it all working.

Sony MacView Cable Adapter (Universal Macintosh to PC Monitor)
Part # T-9985-647-1
Sony Service Parts for Order: 1-800-488-7669

There is also a Macintosh to Macintosh model in case the projection pad you are using has a Macintosh video connector instead of a VGA connector.

Modem AT Command Set: Description Part 1/2 (6/95)

Revised: 6/14/95
Security: Everyone

Modem AT Command Set: Description Part 1/2 (6/95)

=====

Article Created: 14 June 1995

TOPIC -----

This is part one of a two part article that includes a description of modem states as well as the AT command set.

DISCUSSION -----

MODEM STATES

=====

Moving between command and online states

=====

The modem always goes to command state when turned on or after reset. It automatically enters online state after successfully making a connection with a remote modem, either when answering or originating a call.

While the modem is in online state, you can issue a command that takes it back to command state. When you control the modem in this fashion, it is in local command state. While in local command state you can send commands to the modem from your keyboard. During a connection you can switch between online and command state as needed.

In order to issue AT commands to the modem, you will need to determine the setting within your communications program that allows you to control a modem directly using AT commands. Consult the user's guide that came with your software to find out how to enter AT commands from your keyboard.

The most important AT commands are listed below. The rest of this appendix gives complete descriptions of all commands supported by the Express Modem software.

- To enter command state while connected, type the escape sequence +++.
- To go back to online state, type ATO<CR>.
- To hang up, type ATH<CR>.

The <CR> is a notational convention for carriage return. Most commands are not actually sent to the modem until you type the carriage return.

AT COMMAND SET =====

AT refers to the command prefix (attention sequence) that precedes each command to the modem. With the exception of A/, all commands must be preceded by AT and end with a carriage return <CR>. In this appendix, the modem's default value and description are shown in boldface type.

Special Commands =====

A/ Repeat last command -----

The A/ command instructs the modem to repeat the last command line. A command line termination character <CR> is not required for the execution of this command: that is, the command is executed as soon as the slash is typed.

+++ Return to command state (escape sequence) -----

The escape sequence is used to force the modem back to local command state from online state. Do not type any other commands or make entries before or after the escape sequence for a period equal to the guard time set in register S12 (default is one second).

The modem sends an OK result code to the terminal and switches to command state.

The actual escape character is specified by register S2, expressed as the ASCII value of the escape character (default is 43, '+').

Standard AT commands =====

AT The attention command prefix -----

The prefix AT must precede every command. The remainder of the command line contains commands for the modem. The command line must end with a carriage return. If AT is sent alone (that is, it is followed by a <CR>), then no command is executed but an OK result code is returned.

A Answer -----

The A command forces the modem to go off-hook in answer mode. The modem then starts sending the answer tone (CCITT answer tone independent from the B setting), unless the modem is set for leased line (&L command) state. If no carrier signal is received from the telephone line within the number of seconds

specified by register S7, the modem goes on-hook.

This command must be the last on a command line. Sending any character to the modem during call establishment will abort the command and generate a NO CARRIER result code.

Bn Communication protocol category preference

This command determines which communication standard will be used for the next connection.

- 0 CCITT mode
- 1 Bell 103 and Bell 212A, instead of V.21 and V.22, in case of fallback
- 2 CCITT V.23 only

D Dial

This command signals the modem that the numbers, letters, and commas that follow are all part of the telephone number it should dial.

You may include other dial command characters in combination with the D command:

T, P, comma (,), W, colon (:), "at" sign (@), exclamation point (!), R, semicolon (;), and S=n. Each of these optional modifiers is described in the following sections. For clarity's sake, you may also use other characters or symbols (for example, parentheses, hyphens, or spaces) without affecting the number.

In addition to the digits 0 through 9, your modem can also dial the six special characters (*, #, A, B, C, D) found on some Touch-Tone dial telephones.

T Touch-Tone dialing

All subsequent numbers are Touch-Tone dialed until the P command (for pulse dialing) is selected.

P Pulse dialing

Selects pulse dialing, with the dialing speed fixed at 10 pulses per second.

You can mix Touch-Tone and pulse dialing within the same telephone number. The digits immediately following a P command will be pulse dialed; those following a T command will be Touch-Tone dialed.

, Pause

The comma modifier introduces a delay time before dialing the next dial character or executing the next character in the dial string. The pause time is the value of the S8 register (default=2 seconds).

W Dial tone detect

The W modifier is used to make the modem detect a dial tone before sending the next digit. If the tone has been detected by the modem before the S7 register

time delay, the modem continues dialing the rest of the characters in the dial string. If no tone is detected, the modem goes on-hook, returns the NO DIAL TONE result code to the host, and enters the command state. This modifier can be embedded anywhere in the dial string. Example: ATDT9W5551234.

: Calling Card tone detect

Same as W. The colon can detect most calling card tones. Place the colon in the dial string when you want to detect a wider range of frequencies.

@ Wait for quiet answer before dialing

For the time specified in the S7 register (default=50 seconds), the modem attempts to detect 5 seconds of silence. This period of silence confirms that the call has been answered. Once 5 seconds of silence have been detected, the modem dials the remaining numbers in the command line. The remaining numbers may be a security code, another telephone number, or an extension. If no quiet time is detected, the modem hangs up and returns NO ANSWER. The following is an example using the @ modifier:

atdt312555-1432@4622

! Flash

This modifier causes the modem to go on-hook then back off-hook, as if the hook button on the telephone set had been pressed momentarily. This modifier can be placed anywhere in the dial string.

R Reverse mode

The R modifier changes the modem from originate mode to answer mode once the dialing process has been completed. This command is used only at the end of the dial string. This modifier is used for compatibility with old originate-only modems.

; Return to local command state after dialing

The semicolon (;) modifier may be put at the end of the dialing command. It forces the modem back to the local command state after dialing a number. The modem does not attempt a connection. This allows you to use the modem as a dialer (you must pick up the telephone handset at the end of the dial command) or to dial numbers in two or more steps. You may also force the modem to ignore the dial tone (blind dialing) by starting the dial string with ";D". This modifier may also be used in Fax Sender, AppleLink, and other communications applications.

S=n Dial telephone number stored at location n

Dials telephone number stored in location n, where n is 0, 1, or 2. You must have previously saved the value with the AT&Z command.

L Dial last telephone number Redials the last number dialed when placed after the D command.

En Echo off/on

When the echo is turned on, the characters sent to the modem in command state are echoed back by the modem to the host computer. The E command is functional only when the modem is in command state.

- 0 Turns off echo.
- 1 Turns on echo. This allows you to verify that characters you have sent to the modem have been received and sent back.

Hn Hook (hang up)

When the modem is online, you must first enter the +++ escape sequence to take the modem back to command state before issuing the hang up command ATH.

- 0 Forces the modem on-hook. Hangs up the modem's connection to the telephone line.
- 1 Forces the modem off-hook.

In Information

- 0 Returns the modem's product ID code.
- 1 Returns a modem code.
- 2 Returns OK.
- 3 Returns the modem's country code.
- 4 Returns a list of modem features.
- 9 Returns Apple product code and firmware version of the modem.

Ln Speaker volume

This command has no effect, as the speaker is a component of the Macintosh and set in the Sound control panel. The command is included for compatibility purposes.

Mn Speaker on/off/auto

This command sets the usage of the speaker during connections.

- 0 Disables speaker.
- 1 Turns on the speaker until carrier is established.
- 2 Leaves the speaker on throughout the entire connection.
- 3 Turns the speaker on until a carrier is detected, except during dialing.

Nn Communication protocol preference

This command determines the desired connection speed, in conjunction with register S37.

- 0 Use S37 for speed selection. If S37=0, connect at highest possible speed. Otherwise, connect at speed specified in S37.
- 1 Connect at highest possible speed according to value of S37. Fall back if necessary.

2 Same as N1 for compatibility reasons.

Note: For N1 or S37=0, the setting of ATB is ignored. The modem automatically determines Bell or CCITT mode.

On Return to online state

Returns modem to online state from command state.

- 0 Is used to return to the online state after having entered the command state using the escape sequence.
- 1 Same as above and will retrain the carrier (possibly at a lower speed) before reentering online state.

P Enable pulse dialing

Sets the default dialing mode to pulse mode.

This command can also be used as a subcommand of the D command.

Qn Quiet (refer to command Vn)

- 0 Allows result codes to be sent to your screen.
- 1 Turns off the result code messages.
- 2 Returns result codes when originating a call but not when answering.

Sn Select an S register

The S registers refer to memory locations used for configuration.

Most of the S registers deal with some aspect of timing. The S commands are used to assign values to various registers in the modem's memory.

n? The Sn? command (n=register number) is used for checking the contents of a register. The result is always expressed as a three-digit number, where the leading digits or all digits may be 0.

Sn=r is used to change an S register value (where n is the number of the register and r is the assigned value).

NOTE: Refer to the TIL article titled "Modem AT Command Set: S Registers" for a complete list of the S registers.

T Enable tone (DTMF) dialing

Sets the default dialing mode to

Touch-Tone mode. Can be used in dial string (default).

System 7.5: Changing and Restoring Jigsaw Puzzle PICT (7/95)

Article Created: 13 June 1995
Article Reviewed/Updated: 19 July 1995

TOPIC -----

This article describes how to change and then restore the PICT that System 7.5 uses for the Jigsaw Puzzle.

DISCUSSION -----

Changing the Jigsaw Puzzle

You can easily paste a different picture into your System 7.5 Jigsaw Puzzle. Simply copy any PICT graphic and paste it into the open Jigsaw Puzzle application. You may receive a message telling you to increase the puzzle application's memory. The message includes a minimum recommended size.

Restoring the Jigsaw Puzzle

The changed picture is stored in the Preferences Folder in a file called "Jigsaw Picture". Dragging this file to the Trash and relaunching the Jigsaw Puzzle application returns it to the picture stored in the resource fork of the application.

This should be a map of the world unless the PICT resource has been modified using a resource editing utility like ResEdit. If this is the case, you need to remove and reinstall the "Jigsaw" application and remove the "Jigsaw Picture" preferences to return the picture to the world map.

Macintosh: How Often Should I Defragment My Hard Drive? (7/95)

Article Created: 13 June 1995
Article Reviewed/Updated 19 July 1995

TOPIC -----

I have read that my hard drive can become fragmented over time causing the performance of my computer to degrade. Should I frequently defragment my hard disk?

DISCUSSION -----

The file system model used on Macintosh computers is designed to work with a certain degree of fragmentation. This is normal and does not significantly affect performance for the majority of users.

Fragmentation occurs when you delete and create files. For example, suppose you create three files, then delete the second one. If you introduce a fourth file, which is larger than the size of the second file, the Macintosh file system may put a portion of the fourth file in the space occupied by the second file, and put the remainder after the third file. To access the entire file, therefore, the file system has to look in two places.

Defragmentation software attempts to put everything in tidy blocks, so it would move the files around until they are all contiguous, thus the file system only has to look in one place.

In reality, however, the nature of the files, the nature of the work you are doing, the nature of random-access disk mechanisms and the exact order in which the files are segmented can all have a bearing on the resulting performance. In general, there is not significant degradation of performance from normal use of your computer.

If you create and delete a huge number of files, your hard drive may become fragmented to the point that you may see a slight slow-down of file system performance. At this point, you can either use a defragmenting utility, or back up your hard disk and use Apple HD SC Setup to reinitialize it.

WARNING: Reinitializing erases all the files on your hard drive. Make sure you have a complete backup because you will need to restore all your files once initialization is complete.

It should not normally be necessary to defragment your hard disk frequently.

Another thing to consider is that the defragmenting process generally results in a huge amount of disk activity, due to the amount of data being incrementally transferred. Some disk defragmenting software packages also cannot completely recover, if a critical portion of data on the hard disk should be in "transit" when the software fails, you may run the risk of losing that specific file, or all data on your hard drive.

Apple recommends keeping a current backup of your hard drive. You should be especially careful to fully backup your hard drive before running any defragmentation software.

System 7.5: How Apple Menu Options Affects Performance (9/95)

Revised: 9/29/95
Security: Everyone

System 7.5: How Apple Menu Options Affects Performance (9/95)

Article Created: 13 June 1995
Article Reviewed/Created: 29 September 1995

TOPIC -----

My system seems to have a delay or pause of a few seconds doing many simple things. For example, when an open file/save as dialog box appears on the screen it is often a few seconds before you can click OK, or Save or whatever. Creating, deleting or moving files and folders also seems to have a delay associated with the operation.

This problem arose after I placed an alias to the hard drive in the Apple Menu Items folder. Simply removing the alias from the Apple Menu Items folder brings back instant response.

DISCUSSION -----

Apple Menu Options (AMO) can slow your system operations when an alias to a hard drive is placed in the Apple Menu Items folder. Placing an alias to a top level folder (with many subfolders and files) in the Apple Menu Items folder can produce a similar slowdown, but more limited impact. Placing many folder aliases or actual folders in the Apple Menu Items folder can also lead to a slowdown, depending on their depth and contents.

There are different methods used in creating a hierarchical Apple Menu.

One method is to acquire the folder information and build the hierarchical menu when you select the folder through the Apple Menu. This makes the menus less responsive, particularly if the path leads off to a mounted server volume. You will see the AppleTalk arrows flash in the upper left corner of your screen as you navigate the hierarchical Apple Menu for a server volume. This is the approach used by NOW menus, MenuExtend from AlSoft, and the shareware extension BeHierarchic, and others.

The approach used by AMO is to pre-build all the hierarchical menus through five folder layers for every folder and folder aliases in the Apple Menu Items

folder. If an alias to a hard drive or server volume is in the Apple Menu Items folder, the top five layers of folders are acquired and cached. This is what is done by AMO as the Finder launches and it causes a delay making the Finder Desktop available. The Apple Menu Options then has to continually "watch" for a folder being modified with a file or folder being created or removed and rebuild the cached menu. This approach makes the Apple menu very responsive, because the menus are all cached. It has the long term effect of imparting a system slowdown during such things as emptying the trash, moving folders, and so on.

AMO has a side effect which exacerbates the issue. Since it creates the Recent Servers folder with aliases to mounted volumes, these volumes are also searched and menus cached. The Apple Menu Options Prefs file grows in size as multiple server volumes are mounted and their folder structure cached in this file. This file can grow to 300-400Kb in size.

The workaround for this problem is not to use an alias to your hard disk in the Apple Menu. The slowdown affect can be lessened by limited use of aliases to certain folders that you wish to navigate hierarchically. Another option is to use one of the alternative products with the other method of creating a hierarchical menu.

MacX and Power Macintosh DOS Compatibility Card (6/95)

Revised: 6/13/95
Security: Everyone

MacX and Power Macintosh DOS Compatibility Card (6/95)

=====

Article Created: 13 June 1995

TOPIC -----

My Power Macintosh DOS Compatible computer is successfully networked to my Netware server using IPX, and I am using TCP/IP software on my Macintosh successfully. However, whenever I run MacX, I see a variety of connection tool errors and freezing when I switch to DOS.

DISCUSSION -----

This is a known issue with the Power Macintosh DOS Compatibility Card and MacX. This issue is different from, only one protocol stack between two CPU's limitation in Tech Info Library article, "DOS Compatibility Card: Using Two IP Stacks (2/95)."

Any DOS networking activated by having VLM.EXE connect to the PC Networking Extension will result in MacX failures and/or DOS card freezing.

Suggested workarounds

- Turn off DOS networking by removing the PC Network Extension from the Extensions folder in the System Folder, or do not load DOS networking software of any kind.
- Use another X windows package that does not use the MacTCP tool. We have not tested any other packages, but we believe the MacTCP tool is the source of the problem.
- Use an X windows servers on the DOS card.

Note that MacX works fine with a Power Macintosh DOS Compatible computer, only DOS networking is incompatible.

MAE 2.0: Freeze at Welcome to Macintosh on Solaris (5/96)

Revised: 5/11/96
Security: Everyone

MAE 2.0: Freeze at "Welcome to Macintosh" on Solaris (5/96)

=====

Article Created: 13 June 1995
Article Reviewed/Updated: 11 May 1996

TOPIC -----

I just loaded MAE 2.0 on a SPARCstation that is not connected to a network. MAE starts fine, but after the "Welcome to Macintosh" screen, MAE will hang. I am unable to quit out of MAE by way of the Window Manager, and must kill the MAE process in a shell. I have tried -nosound and -noextensions, with no effect. If the same machine is added to a network, MAE starts up fine.

DISCUSSION -----

First, to be sure of the specific issue, do the following:

- 1) Start MAE and wait for it to hang
- 2) Open a shell and remove /tmp/at
- 3) MAE should continue to startup

If this corrects this issue, below is the solution to the issue depending on the version of Solaris you are using:

- Solaris 2.4: Install patch 101945-37 on your workstation. This patch is found at sunsite.unc.edu
- Solaris 2.5: Update MAE to 2.0.2 (Patch 2) from www.mae.apple.com or ftp.support.apple.com.

There are no reports of this issue with Solaris 2.3.

Article Change History:

- 11 May 1996 - Complete update of article.
- 30 Jan 1996 - Updated patch version to 101945-36.

MAE: Multiple Ethernet Connects, Can't Select AppleTalk (1/96)

Revised: 1/30/96
Security: Everyone

MAE: Multiple Ethernet Connects, Can't Select AppleTalk (1/96)

=====

Article Created: 14 June 1995
Article Reviewed/Updated: 30 January 1996

TOPIC -----

When opening the Network control panel, I get an alert box with the message "The AppleTalk Interface is not supported, please switch to LocalTalk." After saying OK, I see no interfaces in the Network control panel. How can I have MAE recognize a network interface card for use with AppleTalk?

DISCUSSION -----

The system currently has a network interface card other than le0 set as the default network. Therefore, MAE is unable to properly view the network interfaces available to the system.

To correct this, obtain Patch 2 from one of Apple Computer's internet sites:

- <ftp.support.apple.com> (130.43.6.3)
- www.mae.apple.com (17.255.216.51)

MAE 2.0.2 will support all network interfaces that support the dlpi framework.

Article Change History:
30 Jan 1996 - Updated article with MAE 2.0.2 from Patch 2.

QuickTake 150 Close-Up Lens Works With QuickTake 100 (6/95)

Revised: 6/13/95
Security: Everyone

QuickTake 150 Close-Up Lens Works With QuickTake 100 (6/95)

=====

Article Created: 13 June 1995

TOPIC -----

Can I use the close-up lens that comes with the QuickTake 150 with the QuickTake 100?

DISCUSSION -----

The QuickTake 150 for Macintosh (M3790LL/A) and the QuickTake 150 for Windows (M3791LL/A) come with a close-up lens attachment that provides:

- Accurate image capture from 10-inches to 14-inches
- Parallax error correction
- Flash diffusion
- Built-in rangefinder

The close-up lens attachment will work with the QuickTake 100, as well. However, the close-up lens attachment is available ONLY as a service part (922-1371).

Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

8•24 GC Software Must Have Correct Name To Load (6/95)

=====

Article Created: 13 June 1995

TOPIC -----

I installed the 8•24 GC software for my Macintosh IIIfx running System 7.0.1, but at startup, the icon has a red circle and slash through it. How do I get the software to load?

DISCUSSION -----

This may be due to the control panel not being named correctly. Make sure the control panel has this exact name, "8•24 GC" (without the quotes).

Dark Side of the Mac 4.2: Not Supported By Apple (6/95)

=====

Article Created: 13 June 1995

TOPIC -----

I'm using the Dark Side of the Mac version 4.2 screen saver, is this a supported product.

DISCUSSION -----

Dark Side of the Mac is not produced or supported by Apple Computer. This product is, however, supported by the author, and you should contact the author for more information. The author provides contact information in the Read Me file that comes with Dark Side of the Mac 4.2.

Although Apple does not support the product, a copy of Dark Side of the Mac version 4.2 is posted on "ftp.apple.com". It can be found via the following path:

/dts/mac/hacks/darkside-of-the-mac-4-2.hqx

LaserWriter Memory Management (6/95)

Revised: 6/13/95
Security: Everyone

LaserWriter Memory Management (6/95)

Article Created: 13 June 1995

TOPIC -----

This article provides information on LaserWriter memory management.

DISCUSSION -----

Memory allocation on PostScript LaserWriters varies greatly depending on many factors such as allowable paper sizes, standard amount of RAM, PhotoGrade/Fineprint capability, DPI, and so on. There are a few articles in the Tech Info Library that go into some discussion about how memory is handled for some printers. Here's a list of the ones we found:

"LaserWriter Pro 630: How Memory is Allocated"
"LaserWriter Pro 810: How Memory is Allocated"
"LaserWriter IINTX: Calculating Font Caching RAM"
"LaserWriter IINT and IINTX: How Its 2MB RAM Is Allocated"
"PostScript LaserWriter and Font RAM Availability"
"LaserWriter IINTX: RAM Allocation"

You could use these articles as "guidelines" in determining how RAM is allocated. Here are some excerpts from the articles, including some general information on how memory is handled in our Postscript LaserWriters:

- The MAJORITY of RAM in a PostScript LaserWriter is allocated for the page buffer (the area where the actual page is rendered before being printed).
- Page sizes and dpi values supported by the printer greatly determine the page buffer size. For example, to print a tabloid sized page at 800 dpi on a LaserWriter Pro 810 requires 14.1 MB of RAM for the page buffer alone. Thus, a LaserWriter Pro 810 with 16MB of RAM will only have approximately 1.9MB left for the PostScript interpreter, dictionaries, fonts, font caching, and so on.
- You can determine the amount of available VM by downloading the following PostScript code:

```
/Helvetica findfont 12 scalefont setfont
72 720 moveto
(Available VM: ) show
vmstatus exch sub 10 string cvs show
showpage
```

CAUTION:

If you choose to use the PostScript code provided in this article, you assume all risks involved in making these changes. PostScript code, if not entered correctly, can place the LaserWriter into a condition requiring service.

NSI 1.5.1: Read Me File (5/96)

Revised: 5/15/96
Security: Everyone

NSI 1.5.1: Read Me File (5/96)

=====
Article Created: 14 June 1995
Article Reviewed/Updated: 15 May 1996

TOPIC -----

This article is the Network Software Installer (NSI) 1.5.1 ReadMe file.

DISCUSSION -----

Contents
=====

Interactions with other products

- If you are using System 6.0.8 or earlier
- If you are using MacIPX
- If you are using SoftWindows
- If you are using the Apple Internet Router
- If you are using the SNA•ps Gateway
- If you are using third-party Ethernet cards
- If you are using a system with a 68040 microprocessor

What the Network Software Installer disk includes

- Release notes
 - Network Software Installer 1.5.1
 - LaserWriter Bridge version 2.0.1
- Release notes from NSI 1.5
 - AppleTalk version 58.1.5
 - Apple Built-In Ethernet driver file version 1.0.1
 - Apple Ethernet NB driver file version 1.0.1
 - Apple Ethernet LC driver file version 1.0.1
 - Apple Ethernet CS driver file version 1.0.1
 - Apple Token Ring NB driver file version 1.0.2

Interactions With Other Products

=====

- If you are using System 6.0.8 or earlier: This installer works on only System 7 or later Macintosh computers. The last version of the Network Software Installer to support System 6 was version 1.4.5.

NOTE: This note is not part of the original Read Me file. NSI 1.5.1 should not be installed after installing System 7.5 Update 2.0, or computers with System 7.5.3.

- If you are using MacIPX: The new Token Ring driver is not compatible with MacIPX versions 1.1 and older. Contact Novell Technical Support to obtain an update to newer MacIPX software which will work with this Token Ring driver.
- If you are using SoftWindows: SoftWindows versions 1.0 and 1.0.1 using SMB (NetBEUI) protocols over Token Ring are not 100% compatible with the AppleTalk version included on this disk. Contact Insignia Solutions regarding availability of an update to the SoftWindows software which will work with this driver.
- If you are using the Apple Internet Router: If this release of the Network Software Installer is being used in conjunction with an Apple Internet Router v. 3.0 Installer, Apple Internet Router 3.0 must be installed first. This will ensure that the Router installation does not overwrite the newer AppleTalk software contained on NSI 1.5.1.

The LaserWriter Bridge cannot be used on a Macintosh that has any version of the Apple Internet Router software installed.

- If you are using the SNA•ps Gateway: To use this release of the Network Software Installer with a SNA•ps Gateway, a special custom install option is provided that installs a compatible Token Ring driver for the Token Ring 4/16 NB card. SNA•ps Gateway is not currently supported on the TokenTalk NB or Token Ring NB/c cards. A future version of the SNA•ps Gateway will not require the custom-installed driver.
- If you are using third-party Ethernet cards: The drivers contained in the new driver files do not support third-party Ethernet cards. A third-party card that has duplicated an Apple Ethernet board will use the appropriate Ethernet driver from the system file instead of the Apple driver in the extensions folder file. A system with a third-party Ethernet card will continue to operate using the previously-installed driver after installing this version of the Network Software Installer. Such systems will get the benefit of all of the other updates installed by this Network Software Installer, including the ability to install and use the LaserWriter Bridge.
- If you are using a system with a 68040 microprocessor: Some programs may quit unexpectedly or cause the computer to freeze when you attempt to open them over the network. This problem, as well as others, is fixed by installing the System Update 3.0 available from AppleLink or the Internet (<ftp.apple.com>). This fix has been incorporated into System 7.5.

What the Network Software Installer disk includes

=====

You can use this Network Software Installer to install the following networking products:

- LaserWriter Bridge version 2.0.1
- AppleTalk version 58.1.5
- Network Control Panel version 3.0.2
- EtherTalk version 2.5.7
- Apple Ethernet NB file version 1.0.1, containing drivers for all Apple NuBus Ethernet cards
- Apple Ethernet LC file version 1.0.1, containing drivers for all Apple LC Ethernet cards
- Apple Ethernet CS file version 1.0.1, containing drivers for all Apple Communications Slot Ethernet cards
- Apple Built-In Ethernet version 1.0.1, containing drivers for all built-in Ethernets
- TokenTalk version 2.5.7
- Token Ring Control Panel version 1.0.1
- Token Ring driver version 2.5.2 for the TokenTalk NB Card
- Token Ring driver version 1.0.2 for the Token Ring 4/16 NB and Token Ring NB/c Card
- A/ROSE 1.2.1, for use in some Token Ring configurations

Release Notes

=====

The following section provides some more technical information on the updates provided by this installer. Many readers will not be interested in these details.

Network Software Installer 1.5.1

This release corrects several installer problems that were present in version 1.5. Specifically,

- Localization is included for Swiss-German and Swiss-French systems

- The Finder attribute bits on the system file are no longer cleared. This could have caused the loss of the system, Finder and clipboard file icons. A desktop rebuild may be required to restore the icons after installing NSI 1.5.1 if the icons had been previously lost due to installing NSI 1.5.
- Crashes no longer occur on Power Macintoshes when Ethernet fails to initialize during startup, such as when the Ethernet is disconnected.

Apple Token Ring NB driver file version 1.0.2

There is a known problem with the new Token Ring driver introduced in NSI 1.4.5. The Token Ring control panel, which can be used to select the ring speed of the 4/16 NB card, is unable to set a locally-administered address. At this time, the free, unsupported "Apple LAN Utility" can be used to set a locally-administered address for all current Apple Ethernet and Token Ring interfaces. "Apple LAN Utility" can be downloaded from various Apple support areas. The Token Ring control panel does work properly in conjunction with the old driver used with SNA•ps gateways.

LaserWriter Bridge version 2.0.1

This control panel provides for activating the LocalTalk port while Ethernet or Token Ring is in use. AppleTalk traffic can be passed from the Ethernet or Token Ring to a LaserWriter connected to the LocalTalk port. The LaserWriter Bridge can only be used in conjunction with this version of the Network Software Installer and is not supported on System 6 or systems using Open Transport. The LaserWriter Bridge can only be installed from the custom installation area of the Network Software Installer. Please see the "LaserWriter Bridge User's Guide" document for more information on this program.

Release notes from NSI 1.5

=====

AppleTalk version 58.1.5

An address-mapping problem that could cause slowdowns in EtherTalk or TokenTalk networks was fixed.

The LAP Manager was fixed to avoid sending corrupted TEST and XID response packets in certain heavy traffic situations.

A bug that passed a corrupted length indication to multi-node clients was fixed.

A VM problem that could cause hangs was fixed (this could also have occurred when Ram Doubler was active).

A LocalTalk problem on Power Macintosh computers was fixed that prevented LaserWriter Bridge from working properly.

An additional LocalTalk problem on Power Macintosh computers was fixed that caused slow performance when both LocalTalk and GeoPort were in use.

Apple Built-In Ethernet driver file version 1.0.1

This driver file contains drivers for all Apple built-in Ethernet implementations and is installed in the extensions folder.

The Macintosh Quadra 840AV and 660AV, Power Macintosh 6100, 7100 and 8100 and Workgroup Server 6150, 8150 and 9150 Ethernet drivers were updated to eliminate slowdowns, hangs, lost connections and data corruptions that were possible on some Ethernets.

The DuoDock II driver was updated to properly support locally-administered addresses, which are often used in DECnet environments.

A VM problem that could cause hangs was fixed (this could also have occurred when Ram Doubler was active).

The driver configuration now properly supports machines with Macintosh Processor Upgrade with PowerPC 601 Processor cards.

Changed DMA parameters for the Macintosh Quadra 610, 650, 700, 800, 900 and 950 and Macintosh Centris 610 and 650 and Workgroup Server 60 and 80 to avoid packet loss when sharing the bus with other DMA masters such as SCSI cards and codec cards.

Apple Ethernet NB driver file version 1.0.1

This driver file contains drivers for all Apple NuBus Ethernet cards and is installed in the extensions folder.

A VM problem that could cause hangs was fixed (this could also have occurred when Ram Doubler was active).

Apple Ethernet LC driver file version 1.0.1

This driver file contains drivers for all Apple LC PDS Ethernet cards and is installed in the extensions folder.

A VM problem that could cause hangs was fixed (this could also have occurred when Ram Doubler was active).

Apple Ethernet CS driver file version 1.0.1

This driver file contains drivers for all Apple Communications-Slot Ethernet cards and is installed in the extensions folder.

A VM problem that could cause hangs was fixed (this could also have occurred when Ram Doubler was active).

Apple Token Ring NB driver file version 1.0.2

This Token Ring driver file handles all Apple Token Ring cards for the NuBus - the TokenTalk NB, Token Ring 4/16 NB and Token Ring NB/c. The file is installed

into the extensions folder. The new driver for the Token Ring 4/16 NB and Token Ring NB/c cards has significantly better performance and fewer problems in large source-routed environments than earlier drivers.

Version 1.0 had a problem when used with Token Ring 4/16 NB cards in 24-bit memory mode - attempting to create a resource file on a network volume would fail. Version 1.0.2 fixes this problem.

Version 1.0 uncovered a problem with the LLC implementation on NetWare servers using certain Token Ring cards. Version 1.0.2 provides a work-around for the problem.

This version fixes a hanging problem that could occur when a Token Ring cable was disconnected while the Macintosh was active on the Token Ring. This could have happened when either the Token Ring 4/16 NB card or the Token Ring NB/c card was in use.

This version now attempts to work-around a problem that occurs when a NetWare server using a version of APPLETLK.NLM prior to version 4.50C without a functioning ATTOKLLC.NLM installed. Lack of ATTOKLLC.NLM in such a NetWare server prevents the normal source route discovery process from working (as documented in the IBM Token Ring Architecture Reference). NetWare servers using APPLETLK.NLM version 4.50C or later require the LLC8022.NLM for proper operation.

Macintosh 630 Family: Processor Upgrade & Video/TV System (6/95)

Revised: 6/14/95
Security: Everyone

Macintosh 630 Family: Processor Upgrade & Video/TV System (6/95)

=====

Article Created: 14 June 1995

TOPIC -----

Can I use both the Apple Video/TV System and the PowerPC upgrade (Macintosh Processor Upgrade) in my Macintosh 630 series computer?

DISCUSSION -----

Yes, all of the Macintosh 630 family of computers will accept both the Apple TV/Video System and the Macintosh Processor Upgrade. However, the Macintosh LC 630 DOS Compatible computer will accept the Apple Video/TV System, but not the Macintosh Processor Upgrade.

The following computers are in the Macintosh 630 family: Performa 630, Performa 635, Performa 636, Performa 637, Performa 638, LC 630, and Quadra 630.

Modem AT Command Set: Description Part 2/2 (6/95)

Revised: 6/14/95
Security: Everyone

Modem AT Command Set: Description Part 2/2 (6/95)

Article Created: 14 June 1995

TOPIC -----

This is part two of a two part article that includes a description of modem states as well as the AT command set.

DISCUSSION -----

Vn Verbalize

The V command allows you to choose whether result codes are displayed as code numbers or English words. Unless these messages are being read by a program that does not easily recognize strings of characters, the default setting (V1) is recommended.

- 0 Displays result messages as code numbers (non-verbal).
- 1 Displays result messages as English words (verbal).

Verbalize result codes

- 0 OK Command is correct and has been completed
- 1 CONNECT Connection established
- 2 RING Incoming ring detected
- 3 NO CARRIER No connection or lost the carrier
- 4 ERROR Bad command
- 5 CONNECT 1200 Connection established at 1200 bps
- 6 NO DIALTONE Dial tone not detected in S7 seconds
- 7 BUSY Busy tone detected
- 8 NO ANSWER See ATD...@...
- 10 CONNECT 2400 Connection established at 2400 bps
- 11 CONNECT 4800 Connection established at 4800 bps
- 12 CONNECT 9600 Connection established at 9600 bps
- 15 CONNECT 7200 Connection established at 7200 bps
- 24 CONNECT 300/REL Connection with MNP 300 bps
- 25 CONNECT 1200/REL Connection with MNP 1200 bps

```
26 CONNECT 2400/REL Connection with MNP 2400 bps
27 CONNECT 4800/REL Connection with MNP 4800 bps
28 CONNECT 9600/REL Connection with MNP 9600 bps
29 CONNECT 7200/REL Connection with MNP 7200 bps
30 CONNECT 12000/REL Connection with MNP 12000 bps
31 CONNECT 14400/REL Connection with MNP 14400 bps
```

Protocol negotiation progress codes that work with ATW1 and S95.

```
40 CARRIER 300 Carrier detected at 300 bps
46 CARRIER 1200 Carrier detected at 1200 bps
47 CARRIER 2400 Carrier detected at 2400 bps
48 CARRIER 4800 Carrier detected at 4800 bps
49 CARRIER 7200 Carrier detected at 7200 bps
50 CARRIER 9600 Carrier detected at 9600 bps
51 CARRIER 12000 Carrier detected at 12000 bps
52 CARRIER 14400 Carrier detected at 14400 bps
66 COMPRESSION: CLASS 5 MNP class 5
67 COMPRESSION: V.42BIS V.42 bis compression
69 COMPRESSION:NONE No compression
70 PROTOCOL:NONE Asynchronous mode
77 PROTOCOL:LAP-M Error control mode with LAP-M protocol
80 PROTOCOL:ALT Error control mode with MNP protocol
128 MODEM IN USE Modem already in use for this or another application
```

Wn Progress result codes

The ATW setting determines whether progress result codes are displayed in addition to the ATX setting. Register S95 determines which progress result codes will be displayed.

- 0 Progress codes 40 through 80 disabled.
- 1 Progress codes 40 through 80 enabled.
- 2 Progress codes enabled; identical to W1.

When writing a CCL script, pay attention to result codes for scripts that require a specific response. If progress codes are enabled, the following strings appear on the screen during a connection (in this example, V.22 bis connection with no error control):

- CARRIER 2400
- PROTOCOL:NONE
- CONNECT 2400

Xn Active result code

The result codes listed in Vn are divided into subsets that can be selected by the X command. Dial tone detection is enabled by X2 or X4. Busy tone detection is enabled by X3 or X4. The commands X0, X1, and X3 are appropriate for blind dialing. Blind dialing means the modem dials out even though a dial tone is not detected.

- 0 Selects result codes 0 through 4 and 8.

- 1 Selects result codes 0 through 5, 8, and 10 through 28.
- 2 Selects result codes 0 through 6, 8, and 10 through 28.
- 3 Selects result codes 0 through 5, 7, 8, and 10 through 28.
- 4 Selects all result codes.

Yn Remote break handling

This command sets modem behavior for responding to a long break signal received from a remote modem:

- Greater than 1.6 seconds for an asynchronous connection.
 - An attention frame for MNP or V.42.
- 0 The modem ignores any long breaks received from the remote modem.
 - 1 On receiving a long break from the remote modem, the modem goes on-hook (hangs up) and returns to command state.
 - 2 On receiving a long break from the remote modem, the modem returns to command state but remains connected to the remote modem (does not hang up).

Zn Reset

The Z command tells the modem to perform a software reset.

- 0 Loads Profile 0 into the active profile.
- 1 Loads Profile 1 into the active profile.

&Cn DCD options

Since bus modems have no DTE-DCE serial interface, this command has no effect and remains for scripting compatibility.

0-2 Return OK.

&Dn DTR options

Bus modems do not have a DTR line. For bus modems, an on-to-off DTR transition occurs when you close the connection tool or the application currently using the modem. In this case, the modem goes on-hook.

This command has no effect and remains for scripting compatibility.

0-3 Return OK. Default value is 3.

&F Recall default profile

The current active profile is replaced by the default factory configuration.

&Gn Guard tones

This command specifies whether guard tones should be transmitted. Guard tones are used in some telephone systems to allow proper data transfer over the network. They are not used in the United States.

- 0 Disables guard tone.
- 1 Same as 2.
- 2 Sends 1800 Hz guard tone.

&Kn Local flow control

This command specifies which kind of local flow control is used. Since bus modems have built-in flow control mechanisms between the DTE and the DCE, this command has no effect. Flow control characters generated by the application software are always passed to the line.

This command has no effect and remains for scripting compatibility.

0-5 Respond OK, no action taken.

&Ln Switched/Leased line

This command affects the modem's behavior during the call setup and carrier handshake phases at the beginning of a connection.

0 Selects switched (dial-up) line.

1 Selects conditioned leased line.

&Pn Pulse mode make/break ratio

0 Sets the dial pulse make/break ratio at 39%/61%.

1 Sets the dial pulse make/break ratio at 33%/67%.

&Qn Connection mode

This command allows you to enable and disable error control mode. The &Q command setting has precedence over \N command setting and registers S36 and S48.

0 Asynchronous mode (no error control, disables V.42 and MNP).

5 Error control mode Instructs the modem to make a connection using V.42/MNP and fallback as necessary (see S36 and S48 registers).

6 Same as 0.

&Rn CTS/RTS

Since integrated modems have no DTE-DCE serial interface, this command has no effect and remains for scripting compatibility.

0-1 Return OK.

&Sn DSR

Since integrated modems have no DTE-DCE serial interface, this command has no effect and remains for scripting compatibility.

0-2 Return OK.

&Tn Self-tests

The following diagnostic tests are provided. These tests are available only when no error protocol is engaged. The duration of each test is controlled by register S18.

0 Terminate the test Used to terminate (escape from) a test in progress and return to command state, if S18=0.

- 1 Local analog loopback Initiates a local analog loopback test.
The escape sequence must be entered to terminate this test. This mode tests the local modem and data terminal equipment.
- 3 Local digital loopback Initiates a local digital loopback test.
The modem echoes characters back to the remote modem exactly as received.
- 4 Enable the remote digital loopback Enables the modem to respond to a remote modem attempting to place it in digital loopback test. If a remote modem places the local modem in remote digital loopback mode, the local modem echoes characters back to the remote modem exactly as received from the remote modem.
- 5 Disable the remote digital loopback Prevents the modem from responding to a remote modem attempting to place it in the digital loopback mode.
- 6 Remote digital loopback test In this mode, characters sent to the remote modem are echoed back to the local modem exactly as they were received by the remote modem. This mode tests both local and remote modems and telephone circuits.
- 7 Remote digital loopback with self-test Initiates a Remote Digital Loopback (like &T6) with self-test data pattern generation and error checking.
- 8 Local analog loopback with self-test Initiates a Local Analog Loopback (like &T1) with self-test data pattern generation and error checking.

The tests terminate when an AT&T0 command is issued or when register S18 expires. In the self-test mode, an error counter counts the number of errors and sends the final result to the host at the end of the test. The maximum number of errors that can be counted is 255.

Note: &T1 takes an optional parameter (a single character, A or O) to indicate whether the analog loopback must be done in originate (default) or answer mode.

&Un Trellis coding

Enables/disables Trellis code modulation in V.32.

- 0 Enable Trellis coding.
- 1 Disable Trellis coding.

&Vn Display profiles

Displays the following information

- Active profile
- Stored profile 0
- Stored profile 1
- Stored telephone numbers (see AT&Z).

&Wn Profile saving

This command saves the current active profile.

- 0 Saves the active profile into profile 0.

1 Saves the active profile into profile 1.

&Xn Synchronous clock source

Ignored. Always returns OK. The modem does not support synchronous modes.

&Yn Specify start-up profile

Allows choosing between two different configurations at start-up.

0 Specifies saved profile 0 as start-up configuration.

1 Specifies saved profile 1 as start-up configuration.

&Zn=s Store phone number

Stores the dial string s(64 characters maximum) in location n. The value of n can be equal to 0, 1, or 2. Note that the dial string s is constructed in the same fashion as the ATD command. It therefore must be the last command on the command line and no other characters should follow it in the dial string.

MNP-specific AT commands

\Bn Send break

Sends a break on the line for n times 100 milliseconds (n ranges from 1 to 9).

%Cn Compression enable

Enables/disables MNP Class 5 data compression during MNP reliable connections.

0 Disables MNP 5data compression.

1 Enables MNP 5 data compression.

\Gn DCE flow control

Enables/disables modem-to-modem flow control. Coupled with \X, it determines whether flow control characters are passed through or filtered.

0 Disables modem-to-modem flow control.

1 Enables modem-to-modem flow control.

\Nn MNP feature selection

Determines whether MNP error control is used in connections. The \N command setting also updates register S36.
The &Q command setting has precedence over \N command setting and registers.

0-1 Normal mode MNP disabled.

2 Reliable mode The modem will interrogate the remote modem for MNP capabilities. If the remote modem does not support MNP, the local modem hangs up.

3 Auto-reliable mode The modem interrogates the remote modem for MNP capabilities. If the remote modem supports MNP, a reliable

connection is established. If the remote modem does not support MNP, a normal connection is established.

\O MNP link negotiation

Treated as AT00 command. Modem returns to online state. MNP Link is not negotiated.

\Tn Inactivity timer

Where n is a decimal integer between 0 and 90 specifying minutes. Sets the number of minutes the modem waits before automatically hanging up when data is not sent or received. The default option n=0 disables the timer.

\U MNP link negotiation

Treated as AT00 command. Modem returns to online state. MNP link is not terminated.

\Vn MNP result codes

-
- 0 Disables modified MNP result codes.
 - 1 Enables modified standard MNP result codes 24 to 28.
 - 2 Returns OK. No effect.

\Xn Flow control processing

-
- 0 No pass-through flow control If modem-to-modem flow control is enabled, AT\G1, XON/XOFF characters received from the line are filtered out of the data stream; they are not passed to the DTE.
 - 1 Pass-through flow control If modem-to-modem flow control is enabled, AT\G1, XON/XOFF flow control characters received from the line are passed through to the DTE.

\Y MNP link signaling

Treated as AT00 command. Modem returns to online state. MNP link is not negotiated.

\Z MNP termination

Treated as AT00 command. Modem returns to online state. MNP link is not negotiated.

Modem AT Command Set: S Registers

Revised: 6/14/95
Security: Everyone

Modem AT Command Set: S Registers

=====

Article Created: 14 June 1995

TOPIC -----

This article describes the S registers set and retrieved by the modem AT commands.

NOTE: Refer to the TIL articles titled "Modem AT Command Set: Description Part 1/2" and "Modem AT Command Set: Description Part 2/2" for a complete list of the AT commands.

DISCUSSION -----

The S register descriptions are formatted in the following manner:

S register	Function
------------	----------

Default	Range	Units
---------	-------	-------

Description

S0	Auto answer
----	-------------

0	0:255	Number of rings
---	-------	-----------------

The S0 register sets auto-answer. If the parameter value is non-zero, auto-answer is enabled at the program level. If the number of rings is zero, auto-answer is disabled at the program level. Auto-answer at the system level is controlled in the Express Modem control panel. The number of rings is also set in the Express Modem control panel. For the S0 setting, values from 1 to 255 are equivalent.

S1	Ring counter
----	--------------

0	0:255	Number of rings
---	-------	-----------------

The S1 register is cleared if no rings are detected throughout an 8-second interval. S1 is automatically set by the modem.

S2 Escape Character

43 <+> 0:127 ASCII Decimal

The S2 register determines the ASCII character to be used as the escape character. The escape sequence is used to force the modem from the online state to the local command state.

S3 Line-termination character

13 <CR> 0:127 ASCII Decimal

The S3 register determines the ASCII character to be used as the line-termination character. No matter what value S3 is set to, ASCII 13 is always recognized.

S4 Line-feed character

10 <LF> 0:127 ASCII Decimal

The modem returns the ASCII character programmed in the S4 register as the line-feed character when the modem sends response codes to the computer.

S5 Backspace character

8 <BS> 0:127 ASCII Decimal

The S5 register determines the ASCII character to be used as the backspace character.

S6 Initial blind dialing wait

2 2:255 Seconds

The S6 register determines the number of seconds your modem waits between the time it takes the telephone off-hook and when it actually begins dialing. If the modem is not blind dialing, this register is ignored.

S7 Carrier wait

50 1:255 Seconds

The S7 register determines how many seconds the modem waits for a carrier signal from a remote modem after the dial command line is executed, or when answering an incoming call. If your modem does not receive a carrier tone from the remote modem in the specified amount of time, it hangs up and sends the NO CARRIER message.

S8 Pause time

2 0:255 Seconds

The S8 register determines the delay time for each comma (,) encountered in the dial command line during the execution of the D (dial) command.

S9 Carrier detect response time

6 1:255 1/10 second

The S9 register determines how long the carrier must be present before it is recognized by the modem.

S10 Disconnect timing

14 1:255 1/10 second

The S10 register allows you to specify how long an interruption is necessary before the modem interprets the disruption as a loss of carrier and hangs up. If you enter 255, the modem ignores carrier detect status.

S11 Duration and spacing for DTMF dialing

95 50:255 Milliseconds

Register S11 is preset and should remain unchanged to ensure correct dialing.

S12 Escape code guard time

50 20:255 1/50 second

This value determines the length of time to wait for typing commands before and after issuing the escape sequence, as well as between the escape characters.

S18 Self-test duration

0 0:255 Seconds

The S18 register determines the duration of the AT&T diagnostic self-tests. If a non-zero value is chosen, the modem automatically halts the test after the time period specified and returns to command state. You must then issue an AT&T0 to actually exit the test. If S18 is zero, the self-test continues until it is ended by issuing the escape sequence to return to command mode followed by AT&T0.

S36 Negotiation failure treatment

5 0/3/4/5 Settings

Specifies action that should be taken when an attempt to connect in error-control mode fails.

0 Attempts V.42 connection. Hangs up if remote modem does not support V.42.

3 Makes asynchronous connection. No error control. Same as AT&Q0.

4 Attempts V.42 connection. If this fails, attempts MNP 2-4 connection. If this fails, hangs up.

5 Attempts V.42 connection. If this fails, attempts MNP 2-4 connection. If this fails, attempts asynchronous connection.

S37 Desired DCE connection speed

0 0/3/5:11 Settings

This value is used in conjunction with the ATN and ATB values to determine which modulations are attempted when connecting.

0 Auto-mode Attempts to connect at the highest possible speed.

3 Attempts to connect at 300 bps.

5 Attempts to connect at 1200 bps.

6 Attempts to connect at 2400 bps.

7 Attempts to connect at 4800 bps.

8 Attempts to connect at 7200 bps.

9 Attempts to connect at 9600 bps.
10 Attempts to connect at 12000 bps.
11 Attempts to connect at 14400 bps.

S38 Delay before hang up

0 0:254 Seconds

Specifies the delay before hanging up when the user issues the ATH command. When S38 is set to 255, the modem delivers all the data in its buffers before hanging up.

S46 V.42 bis data compression selection

138 136/138 Settings
136 V.42 only
138 V.42 with V.42 bis compression

S48 Feature negotiation action

7 0/3/7/128 Settings

Selects which error control features are allowed when making connections.

0 Negotiation disabled: try only V.42.
3 Negotiation enabled without detection phase.
7 Negotiation enabled with detection phase.
128 Negotiation disabled: try MNP only. V.42 disabled.

S95 Error control negotiation message option

32 4/8/32 Bits

A bit map to enable different result codes. Linked to ATW when ATW=1.

Bit	Value	Meaning
0-1	1	Not used.
2	4	Enables CARRIER messages only.
3	8	Enables CARRIER+PROTOCOL messages only.
4	16	Not used.
5	32	Enables CARRIER+PROTOCOL+ COMPRESSION messages.

S113 Data calling tone

0 No data calling tone
1 Enables data calling tone.

AppleCD600e: Installer Needs to Overwrite QuickTime Dialog 6/95

Revised: 6/14/95
Security: Everyone

AppleCD600e: Installer Needs to Overwrite QuickTime Dialog 6/95

=====

Article Created: 14 June 1995

TOPIC -----

When I try to install the Apple 600e CD-ROM software, a dialog box comes up requesting to replace the QuickTime software, but that it would overwrite a newer version. I can either click Cancel or Continue. If I click Cancel then the CD software install fails.

DISCUSSION -----

The installer script for the CD-ROM software is attempting to install QuickTime 2.0 into your System Folder regardless of whether it is there or not. When the installer encounters the QuickTime resources in your System Folder with the same name as the ones it is trying to install, it compares the current date with the dates the floppy disks were created and therefore considers the QuickTime on your hard drive to be a "newer" version. If you click Cancel the installation will stop, if you click Continue, it will replace your QuickTime 2.0 software and all QuickTime resources will function normally.

AppleCD 600e: Mounting Hard Drive When Starting From CD (6/95)

Revised: 6/30/95
Security: Everyone

AppleCD 600e: Mounting Hard Drive When Starting From CD (6/95)

Article Created: 14 June 1995
Article Reviewed/Updated: 30 June 1995

TOPIC -----

When I follow the instructions in my AppleCD 600 manual and startup my computer from the CD-ROM Setup disc by holding down Command-Option-Shift-Delete, the CD-ROM mounts on the desktop, but the internal hard drive does not. When I try to run the installer, the disc is the default drive and switch disk is grayed out.

I get the same results when I change the startup disk to the CD-ROM drive using the Startup Disk control panel.

DISCUSSION -----

If the internal hard drive, or whatever drive you want to install onto does not show on the Desktop, then it will not be available to the Installer either.

Here are two alternate ways to bootstrap the CD drive into operation. While the machine is booted up from the CD-ROM Setup CD:

Method 1 - Use HDSC Setup to mount the hard drive.
=====

Step 1

Insert a Disk Tools floppy disk and double click on Apple HD SC Setup.

Step 2

The internal hard drive should be seen by this utility. Click the internal hard drive to highlight it. Click Update.

When the update operation is complete, the internal hard drive will be mounted on the desktop. After quitting from HD SC Setup, resume by running the CD-ROM

installer from the CD-ROM Setup Disk.

A floppy disk with a third party mounting utility, such as SCSIProbe, may also be used to mount the internal drive on the Desktop, in order to use the installer.

Method 2 - Drag copying the minimum CD-ROM drive resources file.

=====

Step 1

Open the folder called "CD-ROM Software" from the CD-ROM Setup disk.

Step 2

Drag copy the file called "Apple CD-ROM" to a floppy disk.

Step 3

Choose Restart from the Special menu and let the Macintosh start up from the normal startup drive.

Step 4

Insert the floppy disk holding the "Apple CD-ROM" file copied from the CD-ROM Setup disk and drag it onto the closed System Folder on the hard drive. Click "OK" to the dialog indicating it will be placed in the extensions folder.

Step 5

Select Restart from the Special menu again.

Step 6

The CD-ROM Setup CD can be inserted after starting up from the hard drive and the CD volume will mount on the Desktop.

Step 7

Run the Installer from the CD-ROM Setup volume to finish installing all files from the CD-ROM Setup volume.

When the Installer is done, it will present an "Installation Complete" dialog with a Restart button. After restarting, your cpu will have full support for the AppleCD 600e.

AppleCD Audio Player: Where Are CD-ROM Names Stored (6/95)

Revised: 6/14/95
Security: Everyone

AppleCD Audio Player: Where Are CD-ROM Names Stored (6/95)

=====

Article Created: 14 June 1995

TOPIC -----

I entered the names of all my audio CDs into the AppleCD Audio Player. When I loaded a CD that I had previously entered the track information, it was gone! When I check the others, they too were gone. What happened? Is there a file where this information is stored?

DISCUSSION -----

The AppleCD Audio Player will remember the names of Audio CDs and tracks between shutdowns. The names of CDs and tracks are stored in a file called CD Remote Programs in the Preferences Folder of your System Folder. If this file has been removed, the AppleCD Audio Player creates a new blank one. Your CDs will appear as Audio CD 1, Track 1, Track 2 and so on. In this case, you will need to replace the original file with a backup or re-type the information.

If you locate the original CD Remote Programs file which holds your CD titles, your titles will reappear when you drag it back into the Preferences Folder.

GeoPort: Virtual Memory Compatible With Megaphone Program? 6/95

Revised: 6/14/95
Security: Everyone

GeoPort: Virtual Memory Compatible With Megaphone Program? 6/95

=====

Article Created: 14 June 1995

TOPIC -----

Will Megaphone Voice Messaging software work with virtual memory turned on?

DISCUSSION -----

Cypress Research's Megaphone software will work with Virtual Memory turned on, but if you are experiencing choppy or intermittent sound then try turning off virtual memory.

The extra hard drive access traffic that results from Virtual Memory operations can throw off the critical timing requirements of telephony applications.

MoviePlayer: Availability (5/96)

Revised: 5/23/96
Security: Everyone

MoviePlayer: Availability (5/96)

=====

Article Created: 14 June 1995
Article Reviewed/Updated: 23 May 1996

TOPIC -----

Is MoviePlayer 2.x considered to be public domain software and can it be distributed freely, or is there a purchasing option for this software component?

DISCUSSION -----

A beta version of MoviePlayer 2.0 was first made available on the QuickTime 2.0 Software Developer's Kit which is available from the Apple Programmers & Developers Association (APDA). The first public release of the new MoviePlayer software was on the Power Macintosh 7500 and 8500 computers.

You can get MoviePlayer 2.0 by purchasing one of the new Power Macintosh 7500 or 8500 computers, or the QuickTime Developer Kit from APDA. MoviePlayer 2.1 is available as a software update from online services Apple publishes software updates on.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

System 7.5: Not Enough Access Privileges Message (6/95)

Revised: 6/14/95
Security: Everyone

System 7.5: "Not Enough Access Privileges" Message (6/95)

=====

Article Created: 14 June 1995

TOPIC -----

I get a message saying I do not have enough access privileges when I try to move anything from either the System Folder or from my Applications Folder. What is causing this?

DISCUSSION -----

This message is caused by a folder protection feature of System 7.5. This feature is designed to prevent users from inadvertently deleting essential system software files or installed programs from your hard drive. You can use the General Controls control panel to disable either folder's protection. To do this:

- . Open the General Controls control panel.
- . Locate the section named "Folder Protection" in the lower left corner.
- . Click the box to the left of either or both sections to remove the "X".

NOTE:

If the words "Protect System Folder" and "Protect Applications Folder" are grayed or dimmed, then you will need to turn File Sharing off in the Sharing Setup control panel before you can change the folder protection features.

You can now remove items from the folders you have changed.

Updating to System 7.5.1 with System 7.5 Update 1.0 changes the text of the message to be clearer and indicates how to turn off the protection feature.

Macintosh 5200,5300,6200,6300: No GeoPort (12/95)

Revised: 12/4/95
Security: Everyone

Macintosh 5200,5300,6200,6300: No GeoPort (12/95)

=====

Article Created: 15 June 1995
Article Reviewed/Updated: 04 December 1995

TOPIC -----

Are any of the following computers compatible with the Apple GeoPort Telecom Adapter?

- Power Macintosh 5200/75 LC
- Power Macintosh 5300/100 LC
- Macintosh Performa 5200 series
- Macintosh Performa 5300 series
- Macintosh Performa 6200 series
- Macintosh Performa 6300 series

I've heard these computer do not support GeoPort, but they have a ninth pin on the connector in back which indicates it would work.

DISCUSSION -----

Although the modem ports* on these computers do have nine pins, the ninth pin is not functional; the port is not a GeoPort. The GeoPort Telecom Adapter is the interface to the phone system and requires a GeoPort connection on the computer. Because these computers do not have a GeoPort, you cannot use the either the GeoPort Telecom Adapter or the Apple Telecom 2.0 software.

*Note: Some of the Macintosh Performa computers mentioned here may include an internal modem. When an internal modem is installed on these computers, the modem port is covered.

Article Change History:
04 Dec 1995 - Updated title.
29 Nov 1995 - Added additional computers.

Plaintalk 1.4: Using Speech Recognition ReadMe (8/95)

Revised: 8/4/95
Security: Everyone

Plaintalk 1.4: Using Speech Recognition ReadMe (8/95)

=====

Article Created: 15 June 1995
Article Reviewed/Updated: 04 August 1995

TOPIC -----

The following article is the Read Me document for Plaintalk 1.4 Speech Recognition.

DISCUSSION -----

Using Speech Recognition

With the English Speech Recognition package and the proper hardware, your computer can respond to spoken commands. The software that enables your Macintosh to recognize speech is called Speakable Items.

This document explains how to set up and use speech recognition and the Speakable Items software.

What is Speakable Items?

Speakable Items is a software package that lets you speak commands to your computer. It enables the computer to understand commands that do such things as tell you what time it is, close windows on the screen, or tell you a joke. Speakable Items comes with a set of commands ("speakable items") the computer already understands. You can also create your own speakable items.

The Speakable Items software has three parts you'll often interact with: the Speakable Items control panel, the feedback window, and the Speakable Items folder.

- With the Speakable Items control panel, you turn speech recognition on and off and specify when the computer listens and how it gives you feedback.

- With the feedback window (which is open whenever speech recognition is turned on), you check whether the computer is listening and how it has responded to your command. (The command you gave is displayed in italics and followed by the computer's response.)
- The Speakable Items folder contains all the items whose names the computer can recognize. When you say the name of an item in this folder, the computer acts as if you double-clicked its icon. You can adjust the computer's vocabulary by adding and deleting items to this folder or by changing the names of the items. The folder is in the Apple Menu Items folder, which is in the System Folder. You can open it quickly by choosing the Speakable Items command from the Apple menu.

What you need to use Speakable Items

To use Speakable Items speech recognition, you need these pieces of hardware and software:

- a Power Macintosh computer
- system software version 7.5 or later
- a 16-bit microphone, such as the Apple PlainTalk Microphone or the microphone built into some Apple audio-visual monitors
- the Speakable Items software, which is included on this hard disk

Preparing the microphone

If you don't have an audio-visual monitor with a built-in microphone, you must plug in an Apple PlainTalk Microphone or similar microphone into the microphone jack on your computer. Position the microphone as follows:

- Center the microphone on top of your monitor (if possible), with the microphone's Apple icon facing you.
- Make sure that the microphone is between 1 and 3 feet directly in front of you when you're giving spoken commands.
- Adjust the microphone cord so it is not looped around itself or any other cord.

Preparing the sound software

To make sure the microphone is turned on and set up correctly, you must use the Sound control panel or the Sound & Displays controls panel—whichever you have—to select your microphone as the sound input source:

1. Open the Control Panels window by pulling down the Apple menu and choosing Control Panels.

2. Open the Sound (or Sound & Displays) control panel by double-clicking its icon in the Control Panels window.

3. Use the control panel to select your sound input source:

- If you have the Sound control panel, click the Options button. In the Options dialog box that opens, click Microphone; or, if you are using the microphone built into an AudioVision 14 Display, click AV Connector instead.
- If you have the Sound & Displays control panel, click an item in the Sound In list to indicate which source you're using.

Note: If you get an error message while you're using the Sound (or Sound & Displays) control panel, you may need to turn off the speech recognition software (if you've already installed it). To do so, open the Speech control panel and choose Speakable Items from the Options pop-up menu, then click Off. When you're finished setting the sound options, you can turn speech recognition back on.

4. Close the Sound (or Sound & Displays) control panel.

Installing the Speakable Items software

You install the Speakable Items software by using the Installer programs, as described in these steps:

1. Print these instructions before you start. You won't be able to view them on screen during the procedure.

2. Quit any programs you are running.

3. While holding down the Shift key on the keyboard, choose Restart from the Special menu. Don't release the Shift key until you see the "Extensions Off" message on your screen.

4. To start the Installer program, double-click its icon. You can find the Installer icon in the same place you found these instructions.

5. In the initial screen that appears, click Continue.

6. In the next screen, click Install. The installation takes a while.

7. When you see a message that installation was successful, click Restart.

8. After the computer restarts, you will notice that speech recognition is on. Shortly after you restart, you will see two windows on the screen at once: the feedback window and an Apple Guide window containing the first panel of a brief introduction to speech recognition. (Note: You may also see a message telling you the standard microphone is not selected. If so, you need to check your sound input settings, as described in "Preparing the Sound Software," above.)

9. To go through the introduction, follow the instructions in the Apple Guide window.

At installation, speech recognition is turned on. You can turn it off in the Speech control panel, within the Speakable Items option.

Speaking commands

To make the computer respond to your spoken commands, follow these steps:

- Make sure the computer is listening and that you have said the computer's name if that's required. When you first install the software, it's set up so the computer is listening all the time for commands that start with the computer's name. (Note: This listening method is convenient, but it can be confusing if background sounds are mistaken for commands. You may want to change to the most reliable method, as described in "Determining How the Computer Listens," below.)
- Speak clearly. Wait for a moment of silence, then speak in a normal tone of voice at a normal rate of speed. For more information, see "Tips on Speaking to Your Computer," below.
- Use a spoken command that the computer understands. The computer can understand the name of any item in the Speakable Items folder.

Determining how the computer listens

The computer recognizes spoken commands only when it is listening for them. You use the Speech control panel to determine which of these listening methods it will use:

- The computer listens all the time, but it only recognizes commands after it hears its name. (This is the default method, the method that is standard if you don't change it in the Speech control panel. The default name is "Computer.")
- The computer listens all the time for commands. (This is the most convenient but least reliable method.)
- The computer listens only while you are holding down the listening key. (This method is recommended because it is the most reliable method.)

When the Speakable Items software is first installed, it is set up so the computer will listen all the time. If you want to change it to the most reliable method, follow these steps:

1. Open the Control Panels window by pulling down the Apple menu and choosing Control Panels.
2. Open the Speech control panel by double-clicking its icon in the Control Panels window.
3. Open the Options pop-up menu and choose Listening.

4. Within the Listening option, choose a listening key by pressing a key. You may combine the key you choose with any combination of the Shift, Option, or Control keys. Do not choose a key or key combination that you use in any of your application programs. If accepted, the listening key you choose appears in the Key(s) box.

5. Click the button labeled "Listen only while key(s) are pressed." The control panel will look like this:

Now that you've selected these options, you just press and hold your listening key whenever you speak a command and then release the key when you finish speaking the command. If you forget which listening key you chose, look below the character in the feedback window.

Note: You can also choose another method from the Listening area of the Speech control panel. For more information, see "How do I tell the computer when to listen?" in the Speech topic area of Macintosh Guide, available in the Guide menu on some Macintosh systems.

Tips on speaking to your computer

When you talk to your computer, keep the following tips in mind:

- Speak at a normal volume. Don't shout or speak loudly.
- Speak naturally. Don't exaggerate the pronunciation of words.
- Pause before giving a command. Don't give one command immediately after another. (If there are no sound waves drawn next to the feedback character, the computer is ready to hear the command.)
- Speak the name of items in the Speakable Items folder exactly. Don't add extra words or sounds.

Finding out more about Speakable Items

You can find out more information about how to use speech recognition by opening Macintosh Guide from the Guide (Question Mark) menu or by clicking the Question Mark button in the Speech control panel.

Within Macintosh Guide, check for the topic "Speech." If it's available, explore the information in that topic area. (The Speech topic is not available on some Macintosh systems.)

If you see a message that there isn't enough memory available

If you see a message that the Speech Recognizer is having trouble due to lack of memory, save all your open documents and quit the application programs you have open.

To avoid running out of memory while using speech recognition

- Quit the application programs you have open.
- Use the Speech control panel to choose a voice that requires less memory, or turn off voice feedback altogether. (The voices named "Agnes," "Bruce," and "Victoria" take up the most memory.)
- Use the Memory control panel to turn on virtual memory. (With virtual memory on, voices may be slightly distorted and, with some programs, speech performance may decrease.)
- Add more memory to your computer. (If you are running System 7.5 or later on a Power Macintosh with PowerTalk, QuickDraw GX, and English speech recognition installed, then it is recommended that your computer have at least 16 megabytes of RAM.)

Note on using the speech recognition software with application programs

Certain programs may interfere with speech recognition. For example, the speech recognition software sometimes cannot recognize spoken commands for 10-15 seconds after you have been typing in Microsoft Word.

Plaintalk 1.4: Using English Text-to-Speech ReadMe (8/95)

Revised: 8/7/95
Security: Everyone

Plaintalk 1.4: Using English Text-to-Speech ReadMe (8/95)

=====

Article Created: 15 June 1995
Article Reviewed/Updated: 07 August 1995

TOPIC -----

This is the Read Me file for using Text-to-Speech in Plaintalk software version 1.4.

DISCUSSION -----

About the English Text-to-Speech Software.

This document contains two parts:

- "Installation Notes for This Computer," which discusses which pieces of the text-to-speech software are already installed on this computer and explains how to install the optional additional software
- "Using English Text-to-Speech," which is a verbatim copy of the Read Me document that comes with the English text-to-speech software (and which will be installed on your hard disk if use the Installer in this folder)

Installation Notes for This Computer.

The folder in which you found this document contains the complete set of files needed to install English text-to-speech software. Most of the software, including MacinTalk 3, is already installed in your System Folder. MacinTalk 3 provides 19 high-quality voices. However, MacinTalk Pro, which comes with three even higher-quality voices, is not yet installed.

The Read Me document copied below, "Using English Text-to-Speech Software," explains more about the English text-to-speech software. You may want to read the following sections of "Using English Text-to-Speech Software":

- To learn how to use the software, go straight to the section "Trying Out the Text-to-Speech Software." Because all the software you need is already installed, you don't need the instructions in the section "Installing the Software."
- If you decide you want to install the MacinTalk Pro software to add the three higher quality voices to the 19 voices you already have, follow the instructions in "Installing the Software." Remember that MacinTalk Pro voices require more random-access memory (RAM) than MacinTalk 3 voices.

Using the English Text-to-Speech Software.

With the English text-to-speech software installed, many Macintosh programs can read English text out loud. One of the programs that can read to you is the SimpleText program, which comes with this computer and is already installed on your hard disk. (You are probably reading this document using the SimpleText program.)

The instructions in this document tell you:

- what you need to use this software;
- how to install the software;
- how to try out the software using SimpleText;
- how to choose a standard (default) voice;
- some technical details;
- how to solve common problems.

What you need to use the English text-to-speech software.

To use the software, you need the following software and hardware.

- a Macintosh or Power Macintosh computer;
- version 6.0.7 or later of system software;
- at least 300 kilobytes of RAM in addition to what the rest of your system software takes;
- at least 5 megabytes of space available on your hard disk.

Installing the software.

To install the English text-to-speech software, follow these steps.

1. Print these instructions before you start. You will not be able to view them on screen during the installation.
2. If you have been using an earlier version of text-to-speech software, see the note for you at the end of this section.

3. Quit any programs you have been using.
4. While holding down the Shift key on the keyboard, choose Restart from the Special menu. Don't release the Shift key until you see the "Extensions Off" message on your screen.
5. To start the Installer program, double-click its icon. You can find the Installer program in the same place you found these instructions.
6. In the introductory screen that appears, click Continue.
7. In the next screen, click Install. The installation takes a few minutes.
8. When you see a message reporting that the installation was successful, click Restart.

After the computer restarts, you can start using the text-to-speech software. You can try it out using the instructions in the next section.

Note for users of PlainTalk 1.0: The improved version of MacinTalk Pro included with this text-to-speech software is intended to replace the old PlainTalk text-to-speech software. However it may not work with some computers that have a 68030 processor. If you have such a computer and want to keep using the old PlainTalk text-to-speech software, you should not use the standard Install procedure described in these steps. Instead, after step 6, choose Custom Install from the pop-up menu, select MacinTalk 2 or MacinTalk 3, then proceed with steps 7 and 8.

Trying out the text-to-speech software.

You can try out the text-to-speech software in the SimpleText program by following these steps.

1. Open any SimpleText document. Or, since this document is already open, you can do the remaining steps with it.
2. Click anywhere in the text to make sure nothing is selected.
3. Choose Speak All from the Sound menu. (If you cannot hear anything, you may have the sound turned all the way off. Check in the Sound—or Sound & Displays—control panel.)
4. If you want the computer to stop reading, choose Stop Speaking from the Sound menu.

You can also try the following:

— To read a portion of the file, select the words you want to read then choose Speak Selection from the Sound menu.

— To have the computer speak in a different voice, select a voice from the Voices sub-menu in the Sound menu, then choose the Speak All or Speak Selection

command from the Sound menu.

– To use the text-to-speech features of other programs, see the instructions that came with those programs.

Choosing a standard (default) voice.

If you have system software version 7.0 or later, you can use the Speech control panel to choose your favorite voice to be the default voice for all your programs. To set the default voice, follow these steps.

1. Open the Control Panels window by pulling down the Apple menu and choosing Control Panels.
2. Open the Speech control panel by double-clicking its icon in the Control Panels window.
3. Open the Options pop-up menu at the top of the Speech control panel and choose Voice.
4. To change the default voice, choose the voice you want from the Voice pop-up menu. To hear what the voice you chose sounds like, click the speaker button. If you're concerned about RAM usage, Agnes, Bruce, and Victoria take about 1,500 kilobytes of RAM; the rest take 300 kilobytes or less.
5. To change the rate at which the default voice speaks, move the slider.
6. Close the control panel.

Technical details.

The software that enables your computer to speak has these components:

- Speech Manager, a system extension;
- one or more of these English speech synthesizers, depending on your hardware and software:
 - MacinTalk 2 for standard-quality speech,
 - MacinTalk 3 for high-quality speech,
 - MacinTalk Pro for highest-quality speech.
- several voice files, each identified with one particular synthesizer;
- the Speech control panel (unless you have system software version 6.0.7 or 6.0.8).

The Installer installs the files that are appropriate for your system.

- If you have version 6.0.7 or 6.0.8 of system software on any Macintosh, these files are installed.
 - Speech Manager, in the System Folder;

- MacinTalk 2, in the System Folder;
 - 9 voices, in the Voices folder, which is in the System Folder.
- If you have version 7.0 or later of system software on a Power Macintosh or on a Macintosh with a 68040 processor, the following files are installed.
- Speech Manager, in the Extensions folder;
 - the Speech control panel, in the Control Panels folder;
 - MacinTalk 3 and MacinTalk Pro, in the Extensions folder;
 - 19 MacinTalk 3 voices, in the Voices folder, which is in the Extensions folder;
 - 3 MacinTalk Pro voices (Agnes, Bruce, and Victoria), also in the Voices folder.
- If you have version 7.0 or later of system software on a Macintosh with a 33 MHz or faster 68030 processor, the following files are installed.
- Speech Manager, in the Extensions folder;
 - the Speech control panel, in the Control Panels folder;
 - MacinTalk 3, in the Extensions folder;
 - 19 voices, in the Voices folder, which is in the Extensions folder.
- If you have version 7.0 or later of system software on any other computer, the following files are installed.
- Speech Manager, in the Extensions folder;
 - the Speech control panel, in the Control Panels folder;
 - MacinTalk 2, in the Extensions folder;
 - 9 voices, in the Voices folder, which is in the Extensions folder.

Troubleshooting (problems and solutions).

- My Macintosh won't speak.
 - Turn up the speaker volume in the Sound control panel.
 - Choose a voice that requires less random-access memory. The voices Agnes, Bruce, and Victoria take the most memory.
- The Installer program says there's a problem with the hard disk.
 - Re-install your system software, then try installing the English text-to-speech software again.
- The Installer program displays other error messages.
 - Make sure you restart the computer with extensions off, as described in "Installing the Software," above.
- I had an older version of text-to-speech software, then did a custom installation of the new software, but some of my older voices disappeared.
 - The custom installation you chose erased the older version of the software that can use those voices. You can install newer versions of the voices by doing another custom installation of the new software to install MacinTalk 2 or MacinTalk 3 – whichever you used to have. (If you're not sure which you had, you can install both.)

Inc., registered in the U.S. and other countries. MacinTalk is a trademark of Apple Computer, Inc.

Plaintalk 1.4: Spanish Text-to-Speech Software ReadMe (8/95)

Revised: 8/7/95
Security: Everyone

Plaintalk 1.4: Spanish Text-to-Speech Software ReadMe (8/95)

Article Created: 15 June 1995
Article Reviewed/Updated: 07 August 1995

TOPIC -----

The following article is the Read Me document for Plaintalk 1.4 Mexican Spanish Text-to-Speech Software.

DISCUSSION -----

Using the Mexican Spanish Text-to-Speech Software.

With the Mexican Spanish text-to-speech software installed, many Macintosh programs can read Spanish text out loud. One of the programs that can read to you is the SimpleText program, which comes with this computer and is already installed on your hard disk. (You are probably reading this document using the SimpleText program.)

The instructions in this document tell you the following:

- what you need to use this software;
- how to install the software;
- how to try out the software using SimpleText;
- how to choose a standard (default) voice;
- some technical details;
- how to solve common problems.

What you need to use the Mexican Spanish text-to-speech software.

To use the software, you need the following hardware and software:

- a Power Macintosh computer or a Macintosh computer with a 68020, 68030, or 68040 processor;
- version 7.0 or later of system software;

- at least 1.3 megabytes of RAM in addition to what the rest of your system software requires;
- at least 2 megabytes of space available on your hard disk.

Installing the software.

To install the Mexican Spanish text-to-speech software, follow these steps.

1. Print these instructions before you start. You will not be able to view them on screen while you're installing the software.

2. Quit any programs you have been using.

3. While holding down the Shift key on the keyboard, choose Restart from the Special menu. Don't release the Shift key until you see an "Extensions Off" message on your screen.

4. To start the Installer program, double-click its icon. You can find the Installer program icon in the same place you found these instructions.

5. In the introductory screen that appears, click Continue.

6. In the next screen, click Install. The installation may take a while.

7. When you see a message reporting that the installation was successful, click Restart.

After the computer restarts, you can start using the text-to-speech software. You can try it out using the instructions in the next section.

Note for users of older English text-to-speech software. Installing Mexican Spanish text-to-speech software may remove some or all of your older English text-to-speech voices. You can restore those voices by installing the new version of the English text-to-speech software.

Trying out the text-to-speech software.

You can try out the text-to-speech software in the SimpleText program by following these steps.

1. Use the SimpleText program to open any document that contains Spanish text. This document contains some appropriate text (after step 3 in this section).

2. Choose one of the two Spanish voices—named Carlos and Catalina—from the Voices sub-menu of the Sound menu.

3. Select some Spanish text, like the text below.

Las tecnologías de computo y telecomunicaciones tienen el potencial para permitir que muchas personas, que actualmente tienen poco o nulo acceso a informacion valiosa, tengan acceso a los tipos de informacion que pueden tener

una diferencia positiva en sus vidas. Puede ser la informacion que necesitan para ser granjeros mas productivos para que se puedan alimentar a si mismos en vez de depender de ayuda exterior para su supervivencia. O pueden ser las herramientas e informacion que necesitan para alcanzar su pleno potencial humano como participantes auto-suficientes y creativos en el sistema educativo y en sus sociedades.

4. Choose Speak Selection from the Sound menu. (If you cannot hear anything, you may have the sound turned all the way off. Check in the Sound or "Sound & Displays" control panel.)

5. If you want the computer to stop reading, choose Stop Speaking from the Sound menu.

Note: To use the text-to-speech features of other programs, see the instructions that came with those programs.

Choosing a standard (default) voice.

You can use the Speech control panel to choose your favorite voice to hear in all your programs. To set this default voice, follow these steps.

1. Open the Control Panels window by pulling down the Apple menu and choosing Control Panels.

2. Open the Speech control panel by double-clicking its icon in the Control Panels window.

3. Open the Options pop-up menu at the top of the Speech control panel and choose Voice.

4. To change the default voice, choose the voice you want from the Voice pop-up menu. The two Mexican Spanish voices are Carlos and Catalina. To hear what the voice you chose sounds like, click the speaker button.

5. To change the rate at which the default voice speaks, move the slider.

6. Close the control panel.

Technical details.

The software that enables your computer to speak has the following components.

- Speech Manager, a system extension;
- MacinTalk Espanol Mexicano, a system extension that creates Mexican Spanish speech;
- two Mexican Spanish voice files, in the Voices folder, which is in the Extensions folder;
- the Speech control panel.

Troubleshooting (problems and solutions).

- My Macintosh won't speak.
 - . - Turn up the speaker volume in the Sound control panel.
- The Installer program says there's a problem with the hard disk.
 - . - Re-install your system software, then try installing the Mexican Spanish text-to-speech software again.
- The Installer program displays other error messages.
 - . - Make sure you restart the computer with extensions off, as described in "Installing the Software," above.
- After I installed the Mexican Spanish text-to-speech software, my old English voices disappeared.
 - . - You can restore the voices by installing the new English text-to-speech software.

Plaintalk 1.4: Questions and Answers (8/95)

Article Created: 15 June 1995
Article Reviewed/Updated: 04 August 1995

TOPIC -----

This article describes the new features and improvements of Plaintalk 1.4.

DISCUSSION -----

PlainTalk is a collection of software that enables your Macintosh to speak written text and respond to spoken commands. PlainTalk 1.4 includes three components, each with its own installer: English Text-to-Speech, Mexican Spanish Text-to-Speech, and English Speech Recognition.

This document describes each of these three software packages, and discusses the differences between PlainTalk 1.3 and PlainTalk 1.4.

English Text-to-Speech

With the English text-to-speech software installed, many Macintosh programs can read English text out loud. To install the English Text-to-Speech software, you need the following software and hardware:

- any Macintosh or Power Macintosh computer
- version 6.0.7 or later of system software
- at least 300 kilobytes (K) of RAM in addition to what the rest of your system software requires
- at least 5 megabytes (MB) of space available on your hard disk

For more information about the English Text-to-Speech software, see the Using English Text-to-Speech document or the About English Text-to-Speech document in the English Text-to-Speech folder.

Mexican Spanish Text-to-Speech

With the Mexican Spanish text-to-speech software installed, many Macintosh programs can read Spanish text out loud. To install the Mexican Spanish text-to-speech software, you need the following hardware and software:

- a Power Macintosh computer or a Macintosh computer with a 68020, 68030, or 68040 processor
- version 7.0 or later of system software
- at least 1.3 MB of RAM in addition to what the rest of your system software requires
- at least 2 MB of space available on your hard disk

For more information about the Mexican Spanish Text-to-Speech software, see the Using Mexican Spanish TTS document in the Mexican Spanish Text-to-Speech folder.

English Speech Recognition

With the English Speech Recognition package and the proper hardware, your computer can respond to spoken commands. The English Speech Recognition package includes the Speech Recognition system extension, the Speech control panel, and a utility called Speakable Items. With Speakable Items, whenever you say the name of an item inside the Speakable Items folder (which is inside the Apple Menu Items folder), the computer acts as if you double-clicked the item.

You can turn Speakable Items on and off using the Speech control panel. You can also use the Speech control panel to set several preferences for how Macintosh Speech Recognition programs listen and respond. For example, you can set the Listening options in the Speech control panel so that the recognizer only listens while you hold down a key of your choice. When you use this option recognition accuracy is improved and misfires (when the computer thinks you spoke a command but you didn't) are eliminated.

To install and use the English Speech Recognition software, including the Speakable Items software, you need the following hardware and software:

- a Power Macintosh computer
- system software version 7.5 or later
- a 16-bit microphone, such as the Apple PlainTalk Microphone or the microphone built into some Apple audiovisual displays (Note: this version of PlainTalk does not work very well with the microphone built into some AudioVision 14 displays.)

For more information about the English Speech Recognition software and the Speakable Items utility, see the Using Speech Recognition document in the English Speech Recognition folder.

Differences between PlainTalk 1.4 and PlainTalk 1.3

Earlier versions of the PlainTalk software had a single installer program that installed both text-to-speech and speech recognition. This version (1.4)

contains three different installers to make it easier to install just the parts that are appropriate for your needs: English Text-to-Speech, Mexican Spanish Text-to-Speech, and English Speech Recognition. It doesn't matter what order you install them in, and you don't have to install them all. However, if you install version 1.4 of English Speech Recognition or Mexican Spanish Text-to-Speech then you should also install version 1.4 of English Text-to-Speech instead of using an older version of English Text-to-Speech.

Deciding whether to upgrade to version 1.4

In general, version 1.4 offers a more robust and flexible set of features than earlier versions. However, some people in special circumstances may do better with version 1.3.

- If you have a Macintosh AV computer that has a 68040 processor and you use PlainTalk 1.3's speech recognition capabilities, Apple recommends that you continue using version 1.3 of the PlainTalk software. Though the new text-to-speech software works with these computers, the new speech recognition software does not (because it runs on Power Macintosh computers only). It is not recommended that you mix versions, using the old recognition software with the new text-to-speech software. (Note: all the new software works with Power Macintosh AV computers.)

- If you have an Apple AudioVision 14 display, Apple recommends that you keep using version 1.3, unless you have an Apple PlainTalk microphone. Version 1.4 of the speech recognition software does not work well with the microphone built into some AudioVision 14 displays.

- If you make extensive use of PlainTalk 1.3's Speech Macros, the Speech Macro Editor, or the ability to speak menu commands, then you might want to continue using version 1.3. As part of the effort to make the software more robust, version 1.4 of English Speech Recognition supports Apple's standard AppleScript ScriptEditor instead of the Speech Macro Editor, and it does not support the ability to speak menu items. This is discussed more below.

What's new in English Text-to-Speech

English text-to-speech software version 1.4 is very similar to earlier versions. The main differences are:

- English Text-to-Speech 1.4 has its own installer.
- English Text-to-Speech 1.4 includes a Speech control panel that lets you select a system-wide default voice and rate, which is used by many text-to-speech programs, including SimpleText and the Speakable Items utility.

What's new in Mexican Spanish Text-to-Speech

PlainTalk 1.4 is the first version of PlainTalk to include support for Mexican Spanish text-to-speech.

What's new in English Speech Recognition

English Speech Recognition version 1.4 has some significant differences from the speech recognition software in earlier versions of PlainTalk. Some features have been eliminated to simplify speech recognition and make it more robust and usable. Other options have been added to increase accuracy and eliminate misfires.

- Version 1.4 offers a new listening option in the Speech control panel, "Listen only while key(s) are pressed," that lets you leave Speakable Items on all the time without worrying about misfires. It also improves the accuracy of recognition.
- Version 1.4 works in a wider range of environments thanks to its greatly improved adaptation to room acoustics.
- Version 1.4 does not include or support Speech Macros, the Speech Macro Editor, or Speech Rules. It still supports speaking dialog buttons and the Speakable Items folder. Any item you place inside the folder becomes speakable—saying the name of the item launches or opens the item. You can use the AppleScript ScriptEditor to create scripts that are launched by speaking a command: just save the scripts inside the Speakable Items folder. To see examples, look inside the Speakable Items folder.
- Version 1.4 runs on Power Macintosh computers only, and does not support Macintosh AV computers with 68040 processors. You can continue to use PlainTalk 1.3 on 68040 Macintosh AV computers.
- Version 1.4 does not include automatic support for recognizing the spoken names of menu commands. You can still manipulate scriptable programs, such as the Finder, using AppleScript commands. To see examples, look inside the Speakable Items folder.

Known bugs and workarounds in PlainTalk 1.4

This section describes a few bugs found at the last minute in PlainTalk 1.4, along with workarounds where possible. More troubleshooting information can be found in the documents in the three installer folders.

Apple AudioVision 14 displays. Version 1.4 of English Speech Recognition does not work well with the microphones built into some Apple AudioVision 14 displays. If you have problems using speech recognition with the microphone built into this display, you can use the Apple PlainTalk Microphone (part # M9060Z/A) or you can go back to using PlainTalk 1.3. To go back to version 1.3, use the 1.4 installers to deinstall the new version, then use your old 1.3 installers to reinstall version 1.3.

Mixing Text-to-Speech 1.4 with Speech Recognition 1.3. Apple does not recommend using version 1.4 of text-to-speech with version 1.3 of speech recognition. The PlainTalk 1.4 speech recognition options are visible in the Speech control panel but do not work with the PlainTalk 1.3 speech recognition software. If you do mix them, remember to use the correct control panel for your task: to configure speech recognition version 1.3, use the Speech Setup control panel; to configure text-to-speech version 1.4, use the Voice option of the Speech control

panel. You should ignore all the other options of the Speech control panel.

Wrong name in the Using English Speech Recognition document file. In the Using English Speech Recognition document, the phrase "Speakable Items control panel" is sometimes used where what is meant is "Speech control panel."

How will Open Transport be made available to customers?

DISCUSSION -----

Open Transport v1.0 ships as a component of the Mac OS on the Power Macintosh 9500. Later, as Open Transport v1.1 is released to support other Mac OS systems it will be made available through a wide range of channels and distribution options including:

- A no-charge upgrade to customers with MacTCP software maintenance agreements.
- A no-charge upgrade to customers with System Software maintenance agreements.
- Single-user and 20-user shrink-wrap retail products.
- A volume license agreement through the Apple Volume Licensing program.

In addition, Open Transport will be made available to developers who have adopted the technology and wish to ship it as a part of their products.

TOPIC -----

How will Open Transport benefit users, network managers and organizations, and developers?

DISCUSSION -----

Open Transport provides individual computer users with many benefits. Two of the most visible and important benefits relate to making networking more accessible:

Ease of Switching Network Configurations

Open Transport makes it easy to switch from one network configuration to another. A computer user "on the go" might want to connect to the Internet in various locations, each requiring a different network configuration. With Open Transport, settings for each network location can be stored for easy access and use. Changed settings are available immediately -- no restart of the computer is required to use the new configuration.

Integrated Online Help

Open Transport integrates online help, based on Apple Guide technology, to make it easier for an individual to connect to a network, with fewer demands on network manager and support resources.

Open Transport provides significant new flexibility in setting up network configurations. A network manager can recommend or require configuration settings for users on the network, or allow users to determine their own settings.

Open Transport also improves support for centralized configuration management. For example, Open Transport/TCP supports the Dynamic Host Configuration Protocol

(DHCP), letting network managers administer addressing and other TCP/IP configuration information from a central server.

Open Transport makes it easier and more cost-effective to develop Macintosh-based applications for a wide variety of customers. With Open Transport, the Mac OS has built-in networking and communications based on cross-platform industry standards, including the POSIX compliant X/Open Transport Interface (XTI), Unix STREAMs and Data Link Provider Interface (DLPI). Applications written to support Open Transport can directly support a wide range of networking environments (serial, dial-up network, LAN, and WAN), and multiple protocols (AppleTalk, TCP/IP, serial, and others) from a common code base.

Open Transport: Compatibility Q & A (3/96)

=====
Article Created: 15 June 1995
Article Reviewed/Updated: 26 March 1996

TOPIC -----

This article is a series of questions and answers on compatibility for Apple Open Transport.

Open Transport 1.1 is now available, and Apple recommends upgrading to it. Also refer to Open Transport 1.1 Reference Questions and Answers Tech Info Library articles for the most recent information.

DISCUSSION -----

Question: Is Open Transport interoperable with installed AppleTalk or TCP/IP networks?

Answer: Open Transport is compatible with existing AppleTalk and TCP/IP network and network applications at the "packets on the wire" level. Organizations can introduce one, a few, or hundreds of new Macintoshes running Open Transport into their environment without worrying about interoperability with existing networking services.

Question: Will Open Transport require organizations to make changes in network administration, planning, or design?

Answer: The first Open Transport protocols -- AppleTalk and TCP/IP -- offer new features that give a network manager more flexibility and control. Some of these features, when implemented in a network environment will require additional thought and planning by a network manager.

In particular, Open Transport/AppleTalk adds support for the use of static (manually assigned) AppleTalk node addresses. If implemented, a network manager may prefer to assign addresses based on a pre-designed protocol address

management plan.

Open Transport/TCP adds support for the Dynamic Host Configuration Protocol (DHCP). DHCP allows network managers to allocate TCP/IP addresses and other configuration information from a DHCP server. Optimum deployment of DHCP services within an enterprise does require planning.

Question: Which DHCP servers are supported by Open Transport/TCP?

Answer: DHCP is an Internet Engineering Task Force (IETF) standards-track protocol. Apple's implementation conforms to the current versions of the applicable RFCs. To date, Open Transport/TCP has been tested successfully against the following DHCP server implementations:

- Competitive Automation (CA)
- FTP Software
- Hewlett Packard HP-UX
- Microsoft Windows NT Advanced Server
- Silicon Graphics (SGI)
- Sun Solaris
- Sun SunOS
- TGV

Question: What about compatibility with existing applications and network extensions?

Answer: Open Transport provides "backward compatibility" services in five areas:

- To support existing AppleTalk applications
- To support existing MacTCP applications
- To support existing Chooser devices
- To support existing applications dependent on the Mac OS LAP Manager
- To support existing applications dependent on the Mac OS classic network driver architecture.

Open Transport also provides compatibility software to ease the transition from classic NuBus NIC drivers to the new DLPI drivers and PCI bus cards.

Apple is working with developers to compile and publish a detailed compatibility and solutions guide for Open Transport. This is expected to be available later this calendar year.

Question: How is backward compatibility for AppleTalk implemented?

Answer: AppleTalk applications backwards compatibility is accomplished by intercepting all AppleTalk networking calls at the ".ddp" driver API. Above this protocol layer, applications written to the classic AppleTalk APIs continue to rely on the classic (680x0 based) implementation of AppleTalk. Calls to the ".ddp" driver are translated to the corresponding Open Transport XTI calls and are then passed to the new native implementation of DDP for processing. The process is reversed for incoming packets.

Using this approach, backwards compatibility is very robust - the classic implementations of ADSP, ASP, ATP, NBP, ZIP, and PAP are actually present (vs. simply mimicked). This also decreases the total memory footprint of backwards compatibility as compared to an implementation based on individual adaptation layers for each of the AppleTalk protocols. The primary disadvantage of this approach is that applications relying on backwards compatibility do not gain any meaningful performance increases on Power Macintosh; only native DDP is actually in use in these cases.

Open Transport/AppleTalk also includes broad support for existing applications and devices that rely on the existing Chooser or the Network Control Panel software for selection and configuration, known as "cdevs" and "adevs" respectively.

Question: How is backward compatibility for MacTCP implemented?

Answer: TCP/IP (MacTCP) applications backwards compatibility is accomplished by intercepting all MacTCP networking calls at the ".ipp" driver level. Calls to the ".ipp" driver are translated to corresponding Open Transport XTI calls and then passed to the native TCP/IP stack for processing. The process is reversed for incoming packets.

This approach allows all TCP/IP applications to benefit from the native implementation of the TCP/IP protocols on Power Macintosh, at least to some degree. While the backwards compatibility layer itself must run as 680x0 code, most of the handling of the packet happens in the new native Open Transport/TCP implementation. The drawback of this implementation is that "warts and all" backward compatibility is potentially less robust; applications depending on idiosyncrasies of MacTCP are more likely to need an update.

TCP/IP backward compatibility also includes targeted support for existing software products that rely on the MacTCP (or AdminTCP) Control Panel software for configuration. Support for these software modules, known as "mdevs", is more limited than that provided for "adevs", for certain technical considerations. A listing of supported "mdevs" is included with the Open Transport release documentation.

Question: Are there other known limitations to backward compatibility?

Answer: Yes, a few. Applications that rely on undocumented APIs or examine private memory data structures in the current AppleTalk or MacTCP implementations will not be fully compatible with Open Transport. Examples of this include the MacSNMP AppleTalk Agent and the shareware utility MacTCP Watcher. Updated versions of such software will be required.

For dial-up TCP/IP access, current implementations of SLIP and PPP (known as "mdevs") will not be able to auto-dial (automatically connect to the service provider when launching a TCP/IP application). Connections can, however, be made manually. New versions of SLIP and PPP will be able to support auto-dial.

Certain networking extensions - such as MacIPX from Novell, or PATHWORKS from Digital Equipment Corp. - as well as a few applications such as Insignia Solutions SoftWindows bypass AppleTalk and MacTCP networking APIs, and talk directly to the Macintosh OS Ethernet driver software. With the introduction of Open Transport and PCI bus to the Macintosh, this driver architecture and software has changed.

Open Transport backward compatibility allows these existing networking extensions and applications to communicate with the new DLPI based Ethernet driver as if it were a "classic" Ethernet device. This aspect of backward compatibility is limited to the built-in Ethernet adapter of Power Macintosh systems with PCI bus. Thus, current versions of such network extensions and applications (those that write directly to the Ethernet driver) cannot access PCI based network interface cards.

Apple is working directly with developers to identify and address all problems as quickly as possible.

Question: What about MacSNMP? When will it be revised to work with Open Transport?

Answer: MacSNMP v1.5 is under development and is planned to ship early in 1996. This release will include support for MIB II statistics from the Open Transport/TCP stack, transport of SNMP data over Open Transport/TCP, and support in the Macintosh System MIB for PCI interface cases.

Question: Is the Power Macintosh 9500 with Open Transport recommended as an AppleShare or PowerShare server platform?

Answer: Not at this time. As is discussed elsewhere in this document, to meet customer expectations in regards to anticipated increases in flexibility and performance, the AppleShare and PowerShare server applications need to be accelerated for Power Macintosh and adopt the new Open Transport APIs. Also, Apple must complete development and ship Open Transport version 1.1. Work on these projects is under way; additional details available will be available at a later date.

Open Transport 1.0.8: Component Technologies Q & A (3/96)

=====

Article Created: 15 June 1995
Article Reviewed/Updated: 26 March 1996

TOPIC -----

This article is a series of questions and answers on the component technologies in Apple Open Transport.

Open Transport 1.1 is now available, and Apple recommends upgrading to it. Also refer to Open Transport 1.1 Reference Questions and Answers Tech Info Library articles for the most recent information.

DISCUSSION -----

Question: What technology components comprise Open Transport?

Answer: Open Transport supports LANs and WANs and will integrate serial communications, modems, and remote (dial-up) networking in a consistent model for end-users, network managers, and developers. The Open Transport architecture consists of:

- standards-based programming interfaces for applications developers and for network interface controller developers,
- a new cross-platform development model for integration of networking with the underlying operating system,
- new implementations of Mac OS protocol stacks,
- new human interface applications and control panels, and
- a set of backward-compatibility support modules.

Question: What standards are implemented in the Open Transport architecture?

Answer: Open Transport brings standards-based networking into the Mac OS with support for:

- the X/Open Transport Interface (XTI), the POSIX compliant API for support

of networking applications,

- a port of a UNIX System V release 4.2 compatible STREAMs environment for network protocol developers, and
- the Datalink Provider Interface (DLPI), for development of network interface controller (NIC) drivers.

Question: Did Apple develop the STREAMs environment for Open Transport?

Answer: To maximize the stability, performance, and robustness of Open Transport, Apple selected Mentat Inc. -- the leading supplier of high performance kernel-level network software -- to supply both the STREAMs environment and the code base for Open Transport/TCP.

Mentat Portable STREAMs (MPS) is an independent fast, full-featured, multiprocessor safe version of the UNIX System V Release 4 STREAMs environment. Its inclusion in Open Transport provides a reliable platform for Open Transport protocols, including Apple's own implementation of a STREAMs-based AppleTalk stack. MPS also allows easy porting from other platforms of third party protocols. MPS is the same implementation of STREAMs found inside many UNIX operating systems including those from IBM and OSF, as well as other platforms such as Novell NetWare.

Mentat TCP (MTCP) is a robust implementation of TCP/IP that conforms with all industry standards, and makes a significant contribution to the performance and functionality of Open Transport/TCP.

Question: Is there more information available about Mentat Inc. and its products?

Answer: Mentat maintains a presence on the world wide web at:
<http://www.mentat.com>

Question: Which protocols are supported by Open Transport?

Answer: Open Transport version 1.0.x includes new, native implementations of AppleTalk, and TCP/IP, and new consistent API access to serial communications.

Apple and third parties are working to add support to Open Transport for Point to Point Protocol (PPP), NetWare (NCP/IPX), Windows 95 (SMB/TCP/NetBIOS), DECnet, LAT, and X.25. Some of these additional capabilities may be incorporated or bundled with future releases of Apple Open Transport (see Future Directions).

Question: What current Mac OS technologies, components, and products will Open Transport replace?

Answer: When installed Open Transport replaces the current Mac OS implementations of AppleTalk and TCP/IP (including the protocols and the "Network", "MacTCP", and "Admin TCP" control panels). Open Transport is also

designed to replace the Connection Manager and the Communications Resource Manager of the current Communications Toolbox architecture.

Sometime after Open Transport ships as a shrink-wrap software package for the installed base of Macintosh systems, it is planned to replace the "AppleTalk Connection for Macintosh" and "TCP/IP Connection for Macintosh" products.

Question: Is Apple migrating serial communications away from the Communications Toolbox (CTB)?

Answer: Partially, but not entirely. The CTB File Transfer and Terminal Managers continue to be supported and will be preserved in the Copland OS release -- although on new Open Transport/Serial underpinnings.

Over time, plans call for the CTB Connection Manager and its tools to be phased out in favor of Open Transport. In particular, while the Copland release of the Mac OS is expected to provide support for the Connection Manager APIs, at this time Apple has no plans to port the existing Connection Tools to Copland. Thus, Apple recommends that developers plan their update to Open Transport/Serial (and away from CTB Connection Manager) to coincide with (or precede) the availability of the Copland OS release.

Question: What key files are present when Open Transport has been installed on a Mac OS system?

Answer: When installed, Open Transport adds the following Extensions to the Mac OS System Folder:

- Open Transport Library
Open Transport code resource for 680x0-based Macintosh systems.
- Open Tpt AppleTalk Library
Code resource for AppleTalk communication protocol for 680x0-based Macintosh systems.
- Open Tpt Internet Library
Code resource for TCP/IP communication protocol for 680x0-based Macintosh systems.
- OpenTransportLib
Open Transport code resource for PowerPC-based Macintosh systems.
- OpenTptAppleTalkLib
Code resource for AppleTalk communication protocol for PowerPC-based Macintosh systems.
- OpenTptInternetLib
Code resource for TCP/IP communication protocol for PowerPC-based Macintosh systems.
- Ethernet (Built-In)
Code resource to allow access to built-in Ethernet port.
- Serial (Built-In)
Code resource to allow access to built-in serial port.

Question: Are there any changes in AppleTalk or TCP/IP with Open Transport?

Answer: Yes. The new Open Transport/AppleTalk and Open Transport/TCP protocol stacks both have been implemented as Open Transport STREAMs modules and as native code on Power Macintosh computers. They support the new XTI APIs, and their shared libraries can be dynamically loaded and unloaded as needed.

Both protocols also support dynamic reconfiguration (changed settings without requiring reboot), and feature new configuration applications offering Basic, Advanced, and Administrator tools. The new configuration applications -- AppleTalk and TCP/IP -- replace the older control panel implementations -- Network, MacTCP, and AdminTCP. For backward compatibility purposes, the new applications continue to be stored in the Control Panels folder in the System Folder.

Each protocol stack also offers addition protocol-specific feature enhancements.

Open Transport: General Information Q & A (3/96)

=====

Article Created: 15 June 1995
Article Reviewed/Updated: 26 March 1996

TOPIC -----

This article is a general information questions and answers for Apple Open Transport.

Open Transport 1.1 is now available, and Apple recommends upgrading to it. Also refer to Open Transport 1.1 Reference Questions and Answers Tech Info Library articles for the most recent information.

DISCUSSION -----

Question: What is Open Transport?

Answer: Open Transport is the new modern networking and communications subsystem for the Mac OS. Open Transport is based on industry standards and brings a new level of networking connectivity, control, and compatibility to Macintosh customers, while preserving and enhancing the Mac OS, built-in support for easy-to-use networking.

Question: What long-range Apple goals are advanced through Open Transport?

Answer: Apple believes that communications and collaboration technologies are integral and fundamental to personal and workgroup computing. With Open Transport, our goal is to make the Mac OS the best desktop OS for multiprotocol networking, anywhere.

Question: What needs must be addressed to be "the best"?

Answer: Networking and communications technologies are mission critical, so reliability is a base-level requirement. Organizations require interoperability in heterogeneous environments; full compliance with standards is necessary. High

performance is also key. Increasing file sizes -- often related to the rich media types found in graphics and publishing, multimedia, video production, and technical markets -- create a demand for effective use of higher bandwidth communications technologies such as ISDN, FDDI, fast Ethernet and ATM.

Beyond these base-level requirements, network managers, end-users, and developers each have additional needs.

Network managers need networked systems to support a flexible model of administration that accommodates both centralized and decentralized management models.

Users are typically more interested in using communications as a basis for productivity applications. As such, they are interested in networking that is easy to set up and easy to use. This becomes even more important when users are mobile, needing access to networking services from wherever they may be -- without requiring complex reconfiguration for each connection type.

Developers need to address the broadest possible markets with minimum incremental investment. In short, they need standards-based, cross-platform APIs and development tools.

Question: What were some of the key goals driving the development of Open Transport?

Answer: Apple began with two key assumptions: that networking is inherently a multi-platform, multi-protocol proposition; and that customers cannot start over to achieve networking interoperability. This lead us to adopt five key design goals:

- Open Transport must protect customer and developer investments in existing network infrastructure and applications.
- Open Transport must be based on existing cross-platform industry standards.
- Open Transport must provide users with an easy to set-up, easy to use abstraction of the underlying complexity of multi-protocol networking.
- Open Transport must also provide a complementary abstraction of networking and communications services for applications developers.
- Open Transport must offer a flexible run time model -- one that lets a specific protocol be configured and selected at run time, rather than statically linked at compile time.

Open Transport 1.0.8: Performance Q & A (3/96)

Revised: 3/26/96
Security: Everyone

Open Transport 1.0.8: Performance Q & A (3/96)

=====

Article Created: 15 June 1995
Article Reviewed/Updated: 26 March 1996

TOPIC -----

This article is a series of questions and answers on performance for Apple Open Transport.

Open Transport 1.1 is now available, and Apple recommends upgrading to it. Also refer to Open Transport 1.1 Reference Questions and Answers Tech Info Library articles for the most recent information.

DISCUSSION -----

Question: Is Open Transport native on Power Macintosh? Does this make networking faster?

Answer: Open Transport is written to take advantage of the PowerPC processor -- it is native code. This provides the necessary foundation for increased networking performance in the Mac OS. To realize performance gains, however, it is equally important that networking applications also be accelerated for Power Macintosh, and that applications adopt the new Open Transport XTI-based programming interfaces.

The built-in "backward compatibility" support for existing AppleTalk and TCP/IP applications must continue to run as 680x0 code in emulation on Power Macintosh. This protects a customer's investment in networking applications, but also obscures underlying performance increases from the native protocol implementations.

Question: Will existing networking applications see performance improvements with Open Transport on Power Macintosh?

Answer: In general, current Mac OS networking applications are written for the 680x0 processor, and use the "classic" (680x0-based) networking programming

interfaces. These are not likely to see performance boosts with Open Transport, as most of the performance potential is based on the move to native code for the PowerPC processor. Even for Power Macintosh native applications, a continued use of the Open Transport backward compatibility libraries offsets most of the performance gains in the low level protocol handling.

Users that select Power Macintosh native applications that are Open Transport-ready will realize the greatest performance gains. Performance of specific network applications may also be significantly influenced by the underlying processor speed of the system. Customers with demanding, network I/O intensive applications should give strong consideration to the higher performance PowerPC-based Macintosh systems.

However, even with 680x0 emulated applications using backward compatibility, TCP/IP users are more likely to see some performance improvements with Open Transport. This is because of the differences in the way compatibility is provided for MacTCP vs. AppleTalk, and differences in the two protocol architectures.

Question: Does the native code include Ethernet drivers for Macintosh onboard Ethernet adapters?

Answer: PCI-bus Power Macintosh systems ship with a PowerPC native DLPI Ethernet driver for built-in Ethernet. Power Macintosh 6100, 7100, and 8100 models currently have 680x0-based drivers.

Question: When will new or updated applications that support the native Open Transport APIs become available?

Answer: New applications and updated versions of existing applications that are native and use Open Transport are available now. Users are urged to contact the specific third party vendor of interest for more details on their specific product release plans.

Question: How much faster will native Open Transport applications be?

Answer: Networking performance is influenced by many factors. As noted above, customers will see the highest performance networking when using Power Macintosh native applications that fully support Open Transport APIs. Performance will be greater with protocols that use larger datagram sizes, such as TCP/IP, than with AppleTalk (which has a fixed and limited datagram size). On high-speed datalinks such as fast Ethernet, FDDI, and ATM, the performance of the network interface card (NIC) driver code is also a significant factor. Comparative shopping for NICs -- based on price, service, reliability, and performance -- will be in order.

Open Transport -- running on the built-in Ethernet of the Power Macintosh 9500 -- has been clocked at 9.3 Mbps throughput using low-level TCP/IP benchmarks. A pre-release version of a third party Open Transport-native implementation of 'NFS' protocols was benchmarked at 8.4 Mbps. Both figures approach theoretical

maximum performance for 10 Mbps Ethernet. AppleTalk performance is somewhat lower, with low-level benchmarking coming in at a bit over 7.5 Mbps throughput.

Question: What about high-speed networking connections like fast Ethernet, ATM, and FDDI?

Answer: The Open Transport engineering team is continuing to work with NIC developers to realize high-performance DLPI drivers for high-speed datalinks. This is a cooperative effort, with work being done on both driver code and on Open Transport. We expect that high-speed datalink NIC drivers based on Open Transport v1.1 can be fully competitive with other PCI networking products. Of course, performance tuning will be an ongoing priority, as Apple intends to always offer a platform capable of industry leading network performance.

Benchmarking on these types of datalinks, with pre-release Open Transport v1.1 is in progress. Preliminary testing results are very promising:

- 48 Mbps with a Rockwell fast Ethernet card and driver
- 75 Mbps with a Rockwell FDDI card and driver
- 93 Mbps with an Interphase ATM-155 card and driver

These tests are based on Open Transport/TCP running on a Power Macintosh 950/132, and reflect memory to memory, point to point transfers on a dedicated test bed. Additional upside is anticipated as performance tuning continues in preparation for the final release of Open Transport 1.1.

AppleTalk performance is expected to be lower than TCP/IP performance due to various technical issues, including DDP packet size, and the ATP retry-acknowledgment algorithm. Current testing on fast Ethernet is turning in figures around 35-40 Mbps with a PowerPC native AFP server running against a group of still emulated AFP clients. This is a significant performance improvement over current AppleTalk solutions, and further progress should be realized as client code is revised to take advantage of Open Transport and PowerPC.

Question: Will developers ship NICs for fast datalinks based on Open Transport v1.0.x, or wait for tuning planned for v1.1?

Answer: Each developer will make an independent decision to bring their product to market at such time as they are satisfied with the combined performance and reliability of their product with Open Transport. Several vendors are currently shipping PCI solutions for 100BaseTX, ATM, and FDDI. Contact the developer of interest for current availability information (see Developer Adoption).

Article Change History:

- 26 Mar 1996 - Added statement on Open Transport 1.1 release.

Open Transport 1.0.8: System Requirements Q & A (3/96)

Article Created: 15 June 1995
Article Reviewed/Updated: 26 March 1996

TOPIC -----

This article is a series of questions and answers on system requirements for Apple Open Transport 1.0.8.

Open Transport 1.1 is now available, and Apple recommends upgrading to it. Also refer to Open Transport 1.1 Reference Questions and Answers Tech Info Library articles for the most recent information.

DISCUSSION -----

Question: Which Mac OS systems will be able to take advantage of Open Transport?

Answer: Open Transport is designed to work on any Apple Macintosh or Mac OS compatible computer with a Motorola 68030 or 68040 family microprocessor, or a PowerPC 601, 603, or 604 microprocessor. Systems supporting Open Transport must be running System 7.5.x. For 680x0 Macs, 8 MB of total memory is recommended. For Power Macintosh computers, 12 MB of total memory is recommended.

Open Transport is compatible with the use of Virtual Memory, and takes full advantage of the Power Macintosh Code Fragment Manager to offer a much lower system RAM footprint when VM is turned on.

Question: Is Open Transport available for all these systems now?

Answer: Open Transport v1.0 was initially released to support only the Power Macintosh 9500. Beginning with v1.0.6, Open Transport is designed to support all PCI-bus Power Macintosh models, including the Power Macintosh 7200, 7500, 8500, and 9500 systems.

Support for 680x0 and NuBus-based Power Macintosh systems is planned for release

later in 1995.

Question: Will Open Transport v1.0.x run on other Macintosh systems?

Answer: The installer for Open Transport v1.0.x is designed for use specifically on the PCI-bus Power Macintosh systems. While it would be possible to move such an installation of Open Transport to another Macintosh system (for example, on an external hard drive), it is not supported by Apple and is not recommended.

Question: Why was Open Transport made available on PCI-bus Power Macintosh CPUs first?

Answer: Starting with the introduction of the Power Mac 9500, Apple moved to adopt industry standards for both network driver software -- Open Transport DLPI -- and network hardware -- PCI bus. This strengthened the business case for new and existing third party developers who could, as a result, include Power Macintosh in their plans for cross-platform network connectivity products. The Power Macintosh 9500 was the first system to incorporate both of these standards, and has since been followed by additional systems and configurations.

In particular, Apple made the business decision to move to standards for networking on the hardware and software fronts in tandem, i.e., PCI and DLPI. This created a dependency that required customers deploy Open Transport with their PCI-based Power Macintosh systems. It also minimized the work by third parties needed to create drivers for new PCI-bus networking cards. As a result, customers are able to find a broad selection of third party networking options for Macintosh with PCI bus.

Question: Can PCI-bus Power Macintosh systems run "classic" AppleTalk or MacTCP instead of Open Transport?

Answer: Open Transport is required to support PCI-bus networking. Beginning with the Power Macintosh 9500, classic networking applications are supported through Open Transport backward compatibility.

Open Transport: Transport Independence (8/95)

Revised: 8/22/95
Security: Everyone

Open Transport: Transport Independence (8/95)

Article Created: 15 June 1995
Article Reviewed/Updated: 22 August 1995

TOPIC -----

What is transport independence and how does Open Transport enable it?

DISCUSSION -----

Different people judge networking in different ways. End-users focus on what they can do using the network, and tend to select applications based on functionality and ease of use. Network managers are interested in delivering reliable network services in a cost efficient manner. Developers want to create compelling functionality for users, but are strongly influenced by the availability of networking infrastructure.

Unfortunately, with current networking tools and systems, developers are forced to tie their applications to specific network infrastructure requirements -- driven by their API choices. This creates a potential conflict between individual and organizational needs. If network managers dictate protocols to control support costs, users may not have access to the applications they need. If user dictate specific applications, they may increase support costs for the network manager by "dragging along" specific network infrastructure requirements. Developer are stuck in the middle, making decisions for both users and network managers by selection of an API at compile time.

Transport independence is a concept that breaks this undesirable linkage. When implemented, it allows developers to write to a uniform set of APIs, users to focus on selecting the best applications, and network managers to make independent decisions about network infrastructure, all on an ongoing basis.

Open Transport brings together three technologies to support the development and deployment of transport independent applications on the Mac OS:

- A unified set of cross-platform, standards-based APIs for all networking and communications protocols. For example, applications can send and receive data

over an AppleTalk LAN or the TCP/IP-based Internet using the same programming interfaces.

- A dynamic link-and-load architecture and set of protocols. Protocols are loaded and unloaded on demand, conserving system resources, and making it possible to substitute say, TCP for ADSP at the application launch time.
- An addressing and naming support toolbox. For example, applications can open a communications end-point by name (such as, "seeding.apple.com" or "printer16:LaserWriter@sales". Open Transport will automatically provide the appropriate name-to-address mapping services (DNR, NBP, and so on). Together these support the creation of transport independent applications on the Mac OS.

However, not all Open Transport applications are transport independent. While Open Transport provides the necessary foundation, there are certain guidelines and programming practices required for developers to create transport independent applications. For example, most protocols have many features in common -- but also some features that are protocol-specific. If an application depends on a protocol-specific feature, then it will depend upon that protocol as well.

In some cases it may be appropriate to develop a transport-specific application. For example, an MBone client is currently only useful when configured for communication using TCP/IP.

Color LW 12/600 PS: Consumables That Stop Printer (6/95)

Revised: 6/16/95
Security: Everyone

Color LW 12/600 PS: Consumables That Stop Printer (6/95)

=====

Article Created: 16 June 1995

TOPIC -----

When consumables reach end-of-life, does the printer stop?

DISCUSSION -----

Printer operation stops only for three consumables whose ends-of-life might otherwise cause damage to the printer. They are the toner disposal box, fuser oil (printer stops 50 pages after warning light first appears), and the fuser assembly (printer stops 500 pages after warning light first appears).

Ends-of-life for toner and photoconductor cartridges do not stop the printer although image quality will begin to degrade. For example, toner end-of-life is evident by uneven or incomplete toner coverage. Photoconductor end-of-life is evident when you begin to see thin vertical black lines starting about 8 mm from the top and running to the bottom of the page.

Color LaserWriter 12/600 PS: Fuser Oil Pump Error (10/96)

Revised: 10/23/96
Security: Everyone

Color LaserWriter 12/600 PS: Fuser Oil Pump Error (10/96)

=====

Article Created: 16 June 1995
Article Reviewed/Updated: 23 October 1996

TOPIC -----

I just moved my Color LaserWriter 12/600 PS to a new location and now the status panel is showing an error that the Read Me file identifies as a fuser oil pump error (the paper-jam and paper-out lights flash, the yellow toner light illuminates, and one maintenance light is on). What happened?

DISCUSSION -----

The oil may not have been properly extracted from the fuser before you moved the printer. If oil is present in a printer that is being moved and tilted, the oil overflow sensor can become contaminated, which will cause the oil pump error you describe. When the fuser oil pump error occurs, servicing is required.

Before moving your Color LaserWriter 12/600 PS follow the extraction procedures found in Appendix E of the user's guide, and in the Fuser Oil Extraction topic in Service Source.

This information is also applicable to the Color LaserWriter 12/660 PS printer.

Power Macintosh 5200: Level 2 Processor Cache (12/95)

Revised: 12/19/95
Security: Everyone

Power Macintosh 5200: Level 2 Processor Cache (12/95)

=====

Article Created: 16 June 1995
Article Reviewed/Updated: 19 December 1995

TOPIC -----

I have a Power Macintosh 5200 series computer. I realize that the computer comes with 256K Level 2 processor cache, but is it possible to upgrade the cache?

DISCUSSION -----

Since the cache card on this computer also contains the computer's read-only memory (ROM), it would be necessary to purchase a cache card which would include the ROM.

Because of this requirement, Level 2 cache cards used on other Power Macintosh computers will not work with this computer.

Apple Computer, Inc. does not manufacture a higher-capacity cache card for this computer.

At Ease 3.0 Workgroups: Upgrading From Earlier At Ease(9/95)

Revised: 9/26/95
Security: Everyone

At Ease 3.0 Workgroups: Upgrading From Earlier At Ease(9/95)

=====

Article Created: 16 June 1995
Article Reviewed/Updated: 26 September 1995

TOPIC -----

I am about to install At Ease 3.0 for Workgroups on my systems that already have At Ease users and set-ups installed. Will I lose all my users and set-ups?

DISCUSSION -----

For most At Ease upgrades, your administrator password (if you have one) remains the same in the At Ease Setup program in At Ease for Workgroups 3.0. When the At Ease Setup program asks for an administrator name, type At Ease Administrator, which is the default administrator name.

Upgrading From Version 1.x

If you are upgrading from At Ease version 1.x to At Ease for Workgroups 3.0, you must first remove the old version by using the At Ease Installer program that came with the old version. When the Installer screen is displayed, hold down the Option key to change the Install button to Remove. Then click Remove to remove the old version.

Any items you created in version 1.x are automatically assigned to a setup or user named At Ease 1.0.

Upgrading From Version 2.x

Upgrading from version 2.x to version 3.0 occurs automatically when you first run the At Ease Setup program of version 3.0. At Ease turns itself off at the end of the installation process, so you must run the At Ease Setup program to turn At Ease back on.

If you upgrade from any version of At Ease for Workgroups 2.0, you must run At Ease Setup on each computer to update the preferences files and databases before you can add the computer to the list of updated computers. (If a computer is

already in the list, this step is unnecessary.)

Upgrading From Non-Workgroup Version 2.x or 3.0 to At Ease for Workgroups 3.0

At Ease creates setups in the new version for each user in the old version; the new setups have the same names as the old users. For example, if you had two users named Billy and Sally in the non-workgroup version, the At Ease Setup program of At Ease for Workgroups will now show two setups (Billy and Sally) and two users (also Billy and Sally). You can rename users and setups.

HyperCard 2.2: Creating a Home Button Script (6/95)

Revised: 6/19/95
Security: Everyone

HyperCard 2.2: Creating a Home Button Script (6/95)

=====

Article Created: 19 June 1995

TOPIC -----

This article describes why a script from the HyperCard 2.2 Reference manual does not work and the fix.

DISCUSSION -----

In the HyperCard 2.2 Reference Manual there is an exercise to write a script for a button that goes to the Home stack. If you enter the script verbatim from the manual, every time you try to use the button, you will get a "Where is "Home".?" message.

Step 3 of the script appears on page 3-8 of the manual as follows:

. 3. Type go to stack "Home".

If you type in the script exactly as you see it, including the period, then the script will fail. You must delete the period from the script in order for it to run properly.

Macintosh 630 LC: Sound From Comm Slot Express Modem (6/95)

Revised: 6/19/95
Security: Everyone

Macintosh 630 LC: Sound From Comm Slot Express Modem (6/95)

=====

Article Created: 19 June 1995

TOPIC -----

I have a Macintosh 630 LC with a Communications Slot Express Modem Card. How can I hear the modem during dialing or during the handshaking process?

DISCUSSION -----

There was a bug in the original Macintosh 630 LC that prevented the Communications Slot Express Modem's sound from playing through the speaker. This bug was fixed by the EM Sound Update 1.0 extension which has been incorporated into System Software 7.5 Update 1.0. If you install System 7.5 and System 7.5 Update 1.0 there is no longer a need for the EM Sound Update.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

SimpleText and CAP Incompatible (6/95)

Revised: 6/19/95
Security: Everyone

SimpleText and CAP Incompatible (6/95)

=====

Article Created: 19 June 1995

TOPIC -----

We have several Macintosh computers with System 7.5, and a Hewlett Packard (HP) 9000 with HP-UX 9.04 running the Columbia AppleTalk Program (CAP) 6.0 pl 192, and UAR (Unix AppleTalk Router) 1.0 as a file server. With SimpleText open if I save a file to a CAP volume (a volume on the Unix file server) the save appears OK (no error reported), but the file does not get saved. It's not visible from either a Macintosh on the network or from within UNIX.

We have tried a variety of versions of SimpleText -- those that come with Mac OS 7.1, 7.5 (SimpleText 1.1.1), and 7.5.1 (SimpleText 1.2). They all exhibit the same problem.

The only application that seems to have this problem is SimpleText. ClarisWorks saves on CAP volumes, and if we save a file from SimpleText onto the local hard drive, then use the Finder to copy it to the CAP volume, that works too. Is there an incompatibility problem between SimpleText and CAP?

DISCUSSION -----

According to the symptoms you describe, it appears a compatibility problem exists between CAP and SimpleText. We have reported this to engineering for evaluation. We have no known date for a solution, or if a solution will be implemented.

Extended Keyboard II & AppleDesign Keyboard Differences (6/95)

Revised: 6/19/95
Security: Everyone

Extended Keyboard II & AppleDesign Keyboard Differences (6/95)

=====

Article Created: 19 June 1995

TOPIC -----

Are there any differences between the Apple Extended Keyboard II and the Apple Design Keyboard?

DISCUSSION -----

The US versions of the AppleDesign Keyboard and the Extended Keyboard II have the same key layout. However, there are some subtle differences in the overall design of the keyboard.

- The Extended Keyboard II has two ADB connections, one on the right side, and one on the left side. The AppleDesign Keyboard has one ADB connection on the underside of the keyboard for a mouse or other pointing device. There is a 6-foot long cable permanently attached at the front of the keyboard for connecting it to the Macintosh.
- The Extended Keyboard II has a multi-position switch at the front of the keyboard for adjusting the keyboard angle to several positions. The AppleDesign Keyboard has two feet on the underside for raising the keyboard angle (that is two keyboard angles).
- The AppleDesign Keyboard is slightly smaller and lighter. For further information, please see the following Tech Info Library articles, "AppleDesign Keyboard: Technical Specifications (8/94)", and "Apple Extended Keyboard II: Specifications (10/94)."

About the PCMCIA Update 1.0.1 (5/96)

Revised: 5/24/96
Security: Everyone

About the PCMCIA Update 1.0.1 (5/96)

Article Created: 19 June 1995
Article Reviewed/Updated: 24 May 1996

TOPIC -----

This article is the About the PCMCIA Update file.

DISCUSSION -----

You should install the PCMCIA Update on your PowerBook 500 series computer if you use a PC Card (PCMCIA) modem, the PowerBook PCMCIA Expansion Module (Model No. M2864 V1), and are experiencing performance problems. The PCMCIA Update can substantially increase modem driver performance when operating at speeds greater than 9600 bps. It also provides necessary compatibility and performance improvements when you use some 28.8 kbps modem cards.

The PCMCIA Update revises the modem driver software that is permanently stored inside the PowerBook PCMCIA Expansion Module. The software you received on the PowerBook PCMCIA Software disk provided with the module has not changed, so you do not need to reinstall it.

Installing the PCMCIA Update
=====

To install the PCMCIA Update, you use the Updater program. Follow these steps:

Step 1

Make sure your PCMCIA Expansion Module is installed in your PowerBook.

Step 2

Remove all PC Cards from the PC Card slots.

Step 3

Double-click the PCMCIA Updater icon.

Step 4

Click Update when you are ready to update the module. Follow the instructions on the screen.

Step 5

Click Quit when the update is complete to quit the Updater program.

Step 6

Choose Shut Down from the Special menu.

Step 7

Restart your computer.

NOTE: It is important that you shut down your computer first, and then restart (rather than choosing Restart from the Special Menu) for the PCMCIA Update to work properly.

You may want to make a note that you updated your module, since there is no way to tell if a module has been updated or not. (However, updating your module more than once should not damage it.)

Using DOS-formatted PC Cards

=====

NOTE: This section explains how to use DOS-formatted PC Cards in a PowerBook 500 series computer with PC Exchange installed. This information is not necessary for using the PCMCIA Update.

Most storage PC Cards are preformatted in a DOS format. PowerBook 500 series computers have the ability to use DOS-formatted cards because of the Macintosh PC Exchange software that ships with every PowerBook.

You need to use Macintosh PC Exchange version 2.0.2 or greater when using DOS-formatted PC Cards. (This version is included with System 7.5 or can be acquired by contacting the Apple Order Center.

The Tech Info Library article titled "Locating Vendor Information" can help you search for Apple Order Center's phone number.

Installing a newer version of Macintosh PC Exchange

To install a newer version of Macintosh PC Exchange, follow these steps:

Step 1

Drag the PC Exchange icon into the Control Panels folder of your System Folder.

Step 2

Click OK to replace the older version of PC Exchange.

Step 3

Restart your Macintosh.

Reformatting a DOS-formatted PC Card

Macintosh PC Exchange cannot be used to change the format of a PC Card from DOS to Mac OS, or from Mac OS to DOS. If you wish to change a DOS-formatted card to a Mac OS-formatted card, follow these steps:

Step 1

Eject the card you want to reformat.

Step 2

Turn PC Exchange off (open the PC Exchange control panel and select the Off option).

Step 3

Reinsert the PC card.

You are prompted to reformat the PC card as a Macintosh volume. Once the PC Card is reformatted, you can turn PC Exchange back on from the control panel. You cannot reformat a Mac OS-formatted PC card as a DOS-formatted PC Card with PC Exchange. To do so you need to use a DOS/Windows computer.

System 6: Default System Preferences (6/95)

Revised: 6/19/95
Security: Everyone

System 6: Default System Preferences (6/95)

Article Created: 19 June 1995

TOPIC -----

You can customize your Macintosh in a variety of ways to suit your own personal style. For example, you can change ways in which information is displayed, the sounds your system makes, and how it handles file management.

DISCUSSION -----

In System 6, you use the Control Panel under the Apple Menu to adjust functions like mouse-tracking speed. These settings are stored in a chip on the logic board of your computer in a dedicated place called Parameter RAM (PRAM).

You can reset your computer's PRAM in System 6 by holding down the Shift-Option-Command(Apple) keys simultaneously while selecting Control Panels under the Apple Menu. The computer will present you with a dialog box informing you that you are about to reset the Parameter RAM. The Date and Time settings are actually read out of PRAM before it is zapped, then written back in afterwards. The next time you restart your computer the Control Panel will be set as follows:

PREFERENCE	LOCATION	DEFAULT
Disk cache size	General Control Panel	32K
Cursor blink rate	General Control Panel	Middle setting
Menu blink count	General Control Panel	1 times
Date, time, and displayed format	General Control Panel and Alarm DA	None
Keyboard repeat rate and repeat delay	Keyboard Control Panel	For repeat: One away from Fast For delay: One away

from Long

Monitor settings and location of extra monitors	Monitors Control Panel	Primary monitor only; set to Black & White
Mouse tracking and double-click speeds	Mouse Control Panel	For tracking: Fast For double-click: Middle setting
Beep sound	Sound Control Panel	Simple beep, though it is not highlighted
Startup disk choice	Startup Disk Control Panel	None set, uses standard volume search method
Map	Map Control Panel	Empty
Volume	Sound Control Panel	5

System 7.5: Default System Preferences (6/95)

Revised: 6/19/95
Security: Everyone

System 7.5: Default System Preferences (6/95)

=====

Article Created: 19 June 1995

TOPIC -----

You can customize your Macintosh in a variety of ways to suit your own personal style. For example, you can change ways in which information is displayed, the sounds your system makes, and how it handles file management. Your Macintosh uses a variety of Preferences files to maintain your custom settings.

There are several preference settings under System 7.5. System-wide preferences, such as mouse-tracking speed, are set via Control Panels, but are stored in Parameter RAM (PRAM). Preferences specific to the Finder are also set via Control Panels, but are stored in a file called Finder Preferences located in the Preferences folder, in the System Folder.

Here is some information on where each preference is stored, along with instructions for resetting both system-wide and Finder preferences.

DISCUSSION -----

System Preferences

=====

This table lists system-wide preferences that may affect all applications:

NOTE: The PowerBook control panel in System 7.5 is version 7.3.1 and has its own default button.

NOTE: Items marked with a bullet (•) apply to Power Macintosh computers.

PREFERENCE	LOCATION	DEFAULT
-----	-----	-----
32-bit addressing	Memory Control Panel	24-bit addressing
Disk Always on	Memory Control Panel	32K

Modern Memory Manager•	Memory Control Panel	On
Virtual Memory	Memory Control Panel	Off
RAM Disk	Memory Control Panel	Off
Highlight color	Color Control Panel	Black
Cursor blink rate	General Controls Panel	Middle setting
Folder Protection	General Controls Panel	Both unselected
Documents	General Controls Panel	Last folder used with application
Desktop	General Controls Panel	Show Desktop selected Launcher unselected
Menu blink count	General Controls Panel	3 times
Date, time, and displayed format	General Controls Panel and Alarm DA	None
Keyboard repeat rate and repeat delay	Keyboard Control Panel	For repeat: One away from Fast For delay: One away from Long Layout: U.S.
Monitor settings and location of extra monitors	Monitors Control Panel	Primary monitor only; set to Black & White
Mouse tracking and double-click speeds	Mouse Control Panel	For tracking: Very Slow For double-click: Middle setting
Beep sound	Sound Control Panel	Simple beep, though it is not highlighted
Startup disk choice	Startup Disk Control Panel	None set, uses standard volume search method
Cache settings (68040 Macintosh)	Cache Switch Control Panel	Faster (Caches Enabled)
SCSI Disk Mode*	PowerBook Setup Control	2
Wake on ring*	PowerBook Setup Control	Unselected

Except for Date and Time and the default application font all system-wide preferences may be reset by zapping PRAM.

- To zap PRAM under System 7.5, hold down the Command-Option-p-r keys during start up (Make sure the Caps Lock key is up!). The Macintosh restarts shortly after displaying the "Welcome to Macintosh" screen, which indicates that PRAM has been reset.

Finder Preferences

=====

PREFERENCE	LOCATION	DEFAULT
-----	-----	-----
Font used for Finder view	Views Control Panel	Geneva 9
Icon alignment settings for Finder	Views Control Panel	Straight grid - "Always snap to grid" deselected
Icon list view settings for Finder	Views Control Panel	Smallest icon; display sizes, kinds, labels, and dates; deselect "Calculate Folder Sizes" and "Show Disk Info in Header"
Trash Can warning dialog	Setting in Get Info for the Trash Can	Warn before emptying

With the exception of virtual memory, these parameters may be reset by deleting the Finder Preferences file, which is located in the Preferences folder inside the System Folder. Since System 7.5 does not let this file be modified if it is on the start-up disk, you need to disable it instead. To do this, drag the Finder Preferences file out of the Preferences folder and restart the Macintosh. System 7 creates a new Finder Preferences with default values automatically. You may then delete the old Finder Preferences file.

NOTE: The Virtual Memory, File Sharing, and Window Color settings are stored with their respective Control Panel files and cannot be reset using these methods. Virtual Memory and File Sharing can be temporarily disabled, however, by pressing the Shift Key while starting the Macintosh. Hold the key down until "Extensions Off" appears in the "Welcome to Macintosh" screen.

Internet Server For WWW: BBEdit HTML Extension Issue (7/95)

=====

Article Created: 20 June 1995
Article Reviewed/Updated: 12 July 1995

TOPIC -----

A issue has been identified with the BBEdit 3.1.1/AWS HTML Extension v1.3 which ships with the Apple Internet Server Solution for the World Wide Web.

The problem occurs when using any HTML extension which allows you to select a file as a source (using the "file" button in the dialog). When you select a file the first character of the pathname is missing.

Example:
Getting: /owerbook/images/my.gif
Instead of: /Powerbook/images/my.gif

This will render the HTML useless unless the user manually corrects the problem by adding the first character back.

DISCUSSION -----

The following solution to this problem has been suggested by Lindsay Davies, the author of the BBEdit HTML extensions.

Set the Utilities HTML extension preferences to Root directory. The problem will no longer manifest itself.

Additionally, Lindsay suggests the following:
"One suggestion though to make the most of these two tools. Set up the prefs (Root folder, server address, and path), and create a document using a BASE HREF. This will allow you to use all the addressing methods (full, root, and relative). Relative addressing will default to the root address if no BASE HREF is present."

System 7: Frequently Asked Questions (5/96)

Revised: 12/20/96
Security: Everyone

System 7: Frequently Asked Questions (5/96)

Article Created: 20 June 1995
Article Reviewed/Updated: 27 May 1996

TOPIC -----

This article contains a list of frequently asked questions (FAQ) about System 7. It is not necessarily applicable to System 7.5.

Questions in this FAQ:
=====

- How do I create a net install for System 7.x?
- Where can I get a copy of MacTCP?
- How do PC Exchange and Macintosh Easy Open (MEO) work together?
- How can I get System 7.0.1 on 800K disks?
- Where can I download a copy of System 7.1?
- Where is Apple File Exchange located? I thought it came with my system.
- What steps should I follow to perform a reinstallation of System 7.1? What about System 6.0.x? Can you "clean install" System 6?
- Who needs to install the System 7 Tune-Up?
- There seems to be a corrupt font in my fonts folder. When I double-click the font suitcase, I get a -39 error. I can't seem to get rid of this font suitcase! What can I do?
- I recently upgraded to System 7, and am confused about fonts. What's the difference between TrueType and PostScript fonts?

- I occasionally encounter system errors on my Macintosh. There is usually a message that says an error of type 1 or 3 occurred. Where can I find an explanation of what these error numbers mean?

DISCUSSION -----

Question:

How do I create a net install for System 7.x?

Answer:

Follow these steps:

Step 1:

Create a folder called Net Install on a shared volume.

Step 2:

Drag all disk images needed for the installation (all disks except the Disk Tools disk) to the Net Install folder. A folder will be created inside the Net Install folder that corresponds to each diskette.

Step 3:

Drag the Installer and the Install script from the Install Me First or Install 1 diskette to the top level of the Net Install folder.

Step 4:

The Net Install folder is now prepared for remote users to use for performing system software installations. Once they log into the remote volume, they double click the Installer icon and the installation process will run.

Typically, this setup will allow you to install other software packages using the Apple Installer over a network. For more information, review the article "Software Installation Over a Network", in the online Apple Technical Information Library. Use the search string "net install setup" to locate this article.

Question:

Where can I get a copy of MacTCP?

Answer:

You can obtain MacTCP by purchasing the Macintosh TCP Connection Kit or by upgrading to System 7.5. Only the update applications for MacTCP are posted to online services.

Your local dealer can help you obtain these software packages. You can locate a local dealer by calling the Apple Referral Center at 1-800-538-9696.

Question:

How do PC Exchange and Macintosh Easy Open (MEO) work together?

Answer:

When you set up DOS extension mapping in the PC Exchange control panel, they work regardless of where the file is located. A file can be on a DOS floppy disk, or on the Macintosh hard drive and they work the same.

If Macintosh Easy Open is installed, it works with PC Exchange and tries to map files to the proper applications based on the PC Exchange mappings. If the file is not mapped to an application, Macintosh Easy Open attempts to translate the file.

The above information states how it should be working. If it is not working this way then try the following procedures:

- 1) Use your extensions manager control panel to turn off all extensions and control panels except for PC Exchange and MEO. Restart and see if you have same problems. If not then you have an extension conflict.
- 2) While every control panel is off except for MEO and PC Exchange, restart the computer and hold down the Command and Option keys to rebuild the desktop.
- 3) Delete and custom reinstall the PC Exchange and MEO control panels.

NOTE: MEO is for use when you don't know what application you want to open a document. If you already know this, as in the Word example above, open the application first and then locate the document via File Menu Open (Command-O).

In the online Apple Technical Info Library, use the search string "Macintosh Easy Open and sys75" to locate the article "System 7.5: PC Exchange Works with Easy Open"

Question:

How can I get System 7.0.1 on 800K disks?

Answer:

System software version 7.0.1 is not available on 800K disks.

Question:

Where can I download a copy of System 7.1?

Answer:

System 7.1 is commercial software. System 7.1 can be purchased through the Apple Order Center.

Question:

Where is Apple File Exchange located? I thought it came with my system.

Answer:

Apple File Exchange ships with System 7.0, 7.0.1, and 7.1. It is on the system disks, but not installed on the hard drive. To install Apple File Exchange, insert the Tidbits disk from your system software.

In System 7.0 and 7.0.1 Tidbits disk, you will see an Apple File Exchange folder. Copy this folder to your hard drive. In the System 7.1 Tidbits disk, you will see an Apple Utilities folder. This folder contains the Apple File Exchange folder. Open Apple Utilities, and copy the Apple File Exchange folder to your hard drive.

Question:

What steps should I follow to perform a reinstallation of System 7.1? What about System 6.0.x? Can you "clean install" System 6?

Answer:

Instructions for reinstalling System 6.0.x and System 7.x are available in the online Technical Information Library.

Use the search string "clean install and instructions" to locate the articles "System 7.1: Clean Installation from 1.44Mb Disks" as well as "System 6.0.x Installation".

Question:

Who needs to install the System 7 Tune-Up?

Answer:

System 7 Tune-Up 1.1.1 should be installed on any Macintosh using System 7.0 or 7.0.1. The tune-up's changes are incorporated into System 7.1 and later systems.

Question:

There seems to be a corrupt font in my Fonts folder. When I double-click the font suitcase, I get a -39 error. I can't seem to get rid of this font suitcase! What can I do?

Answer:

Corrupt fonts can account for a number of system crashes. Here is how to remove a damaged font suitcase from your Fonts folder:

Step 1:

Move the Fonts folder to the desktop.

Step 2:

Create a new Fonts folder in the System Folder.

Step 3:

Drag the known good Fonts from the desktop Fonts folder to the newly created Fonts folder.

Step 4:

Restart your Macintosh.

Step 5:

..TIL17984-System_7-Frequently_Asked_Questions_5-96_(TA33936).pdf

Drag the Fonts folder on the desktop, with the corrupted font suitcase, to the Trash.

Step 6:

Drag a "good" copy of the corrupted font suitcase from a backup copy or from the original font disk to the closed System Folder.

For more information, review the article "System 7.1: Damaged Font Suitcase Message" in the online Technical Information Library. Use the search string "font and damaged" to locate this article.

Question:

I recently upgraded to System 7, and am confused about fonts. What's the difference between TrueType and PostScript fonts?

Answer:

For an overview of fonts and your Macintosh, check out the article "Bitmap, PostScript, and TrueType Fonts Compared", available in the online Apple Technical Information Library." Use a search string of "truetype and postscript and compare".

Question:

I occasionally encounter system errors on my Macintosh. There is usually a message that says an error of type 1 or 3 occurred. Where can I find an explanation of what these error numbers mean?

Answer:

System error codes are intended to be an aid to programmer's debugging software. They aren't always very helpful when trying to determine the cause of a system crash.

For an overview of the error types and their meaning, review the article "Macintosh System Error Codes Explained", available in the online Apple Technical Information Library. A search string of "system errors and explanation" will find this article.

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center's phone number.

QuickDraw GX: Frequently Asked Questions (5/96)

Revised: 3/19/97
Security: Everyone

QuickDraw GX: Frequently Asked Questions (5/96)

Article Created: 20 June 1995
Article Reviewed/Updated: 10 May 1996

TOPIC -----

This article contains a list of frequently asked questions (FAQ) about QuickDraw GX.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Questions in this FAQ:
=====

- I noticed after installing GX Helper that I don't have the option to disable Desktop Printing in some applications. Why is this?
- How do I select specific LaserWriter Options?
- How do I Select Multi-purpose Input Trays?
- I have a number of non-QuickDraw GX print and fax drivers in my extensions folder yet they do not appear in the Chooser. How can I access them?
- How do I print to an output device that does not have a QuickDraw GX compatible print driver?
- I installed QuickDraw GX, but I do not have a GX driver for my printer. How can I remove QuickDraw GX?
- I noticed my desktop printer icon has an X through it when viewed through the Save or Open dialog box. Is this normal? It looks fine on the Desktop.

- How do I disable the Manual Printing Alert?

DISCUSSION -----

Question:

I noticed after installing GX Helper that I don't have the option to disable Desktop Printing in some applications. Why is this?

Answer:

The option to turn off Desktop printing in the newest versions of Excel (5.0) and Word (6.0) or other recent applications may not appear. These applications are "GX-friendly" and can utilize the QuickDraw GX printer drivers. Because of this, GX Helper does not allow you to disable Desktop Printing.

Question:

How do I Select Specific LaserWriter Options?

Answer:

- a) Create a desktop printer using the LaserWriter GX driver in the Chooser
- b) Print a one page document or the desktop to the printer
- c) Choose Page Setup from a QuickDraw GX savvy application.
- d) Select the specific LaserWriter under the "Format For:" pop-up menu. Do NOT choose LaserWriter GX but the specific name of the LaserWriter.
- e) Click on the "LaserWriter Options" icon on the left side of the window.

You should see all the options available for the LaserWriter you have chosen such as 300/600 DPI or PhotoGrade. The options available here are dependent on the printer model. Consult your printer's documentation for a complete description of features.

Question:

How do I Select Multi-purpose Input Trays?

Answer:

- a) Create a desktop printer using the LaserWriter GX driver in the Chooser
- b) Print a one page document or the desktop to the printer
- c) Select the printer on the desktop and choose "Input Trays" from the Printing Menu.
- d) Make the appropriate selections.

You will know if QuickDraw GX has queried the specific Desktop Printer properly if the dialog window that comes up for paper trays specifically mentions the printer model (example:LaserWriter Pro).

Question:

I have a number of non-QuickDraw GX print and fax drivers in my extensions folder yet they do not appear in the Chooser. How can I access them?

Answer:

QuickDraw GX drivers show up in the Chooser when QuickDraw GX is active. When QuickDraw GX is disabled, the non-QuickDraw GX drivers appear in the Chooser. They are hidden when QuickDraw GX is active because they are incompatible with QuickDraw GX technology.

Question:

How do I print to an output device that does not have a QuickDraw GX compatible print driver?

Answer:

If you have a non-GX driver you can disable QuickDraw GX via the Extensions Manager control panel and restart. This will let you print using the original driver. The only other alternative is to check with the vendor of the output device to see if they are planning a QuickDraw GX compatible driver.

If you have a PostScript output device, you can print your output to a PostScript file using the application EPSExtension. Refer to the QuickDraw GX ReadMe file for more details on the EPSExtension. Most PostScript devices come with utilities that allow you to download a PostScript file to that device. Two examples of such utilities are Adobe's SendPS or the Apple Printer Utility (for printers that use the Apple LaserWriter driver).

ON Page by COMPUTER:applications, Inc. will parse a PostScript printer description (PDD) for a PostScript or PCL device and make a compatible QuickDraw GX driver.

PowerPrint/GX by GDT Softworks adds the advantages of QuickDraw GX to their collection of printer drivers allowing you to print to over a thousand different PC based printers from the Macintosh desktop.

DOS/Windows-Compatible Printers

MacJET GX (Universal PCL/ HP compatible laser printers) is a universal QuickDraw GX driver for PCL and HP-compatible laser printers.

UNIX print servers

Pathway Print Redirector by The Wollongong Group, Inc. takes advantage of the QuickDraw GX printing capabilities to provide TCP/IP network printing capabilities.

Question:

I installed QuickDraw GX, but I do not have a GX driver for my printer. Where do I get QuickDraw GX drivers?

Answer:

You can contact your printer manufacturer or fax software vendor to see if they have a QuickDraw GX compatible driver available. If there is no QuickDraw GX driver available you can remove QuickDraw GX until a driver is available.

The QuickDraw GX Installer has an easy to use remove feature that will remove the components of QuickDraw GX. After removing GX, it may be necessary to restore some fonts that QuickDraw GX converted. Follow these steps for the removal procedure:

- Quit any open applications or desk accessories
- Locate the QuickDraw GX Installer on the QuickDraw GX Install Diskette or System 7.5 CD. It is located on the Install disk or in the QuickDraw GX Install folder on the CD.
- Launch the Installer.
- When you see the Installer's Welcome screen, click continue.
- Open the pop-up menu (which says Easy Install) and choose Custom Remove.
- Click on the check boxes for the components you wish to remove.
- Click on remove.

The installer will remove the selected components. However, any PostScript fonts that were present in the System folder before the QuickDraw GX installation will not work properly because QuickDraw GX placed them in suitcases that standard System Software will not recognize.

Copies of the old fonts were placed in a folder called •Archived Type 1 Fonts• in the System Folder. Open this folder and copy all the fonts to the Fonts folder within the System Folder. If prompted to replace any existing fonts, go ahead and replace them.

If you converted any Postscript fonts using the Type 1 Enabler application, you will need to reinstall the fonts from original diskettes as that application does not place copies in the archive folder.

Finally, if you used Adobe Type Manager, you should also reinstall that application as it may have been removed when QuickDraw GX was installed.

Question:

I noticed my desktop printer icon has an X through it when viewed through the Save or Open dialog box. Is this normal? It looks fine on the Desktop.

Answer:

The desktop printer icon is a container, similar to a folder, but it cannot be saved to. QuickDraw GX and the Finder work together to place an X through the icon in the Save or Open dialog box so that the user cannot open it or save anything to it.

Question:

How do I disable the Manual Printing Alert?

Answer:

You need to be using QuickDraw GX 1.1.1 or later. Click on the Desktop Printer icon and a Printing menu will appear. Go to the Printing menu and select "Disable Manual Feed Alerts".

QuickTime 2.x: Converting MIDI & Karaoke Files (8/96)

Revised: 8/28/96
Security: Everyone

QuickTime 2.x: Converting MIDI & Karaoke Files (8/96)

Article Created: 20 June 1995
Article Reviewed/Updated: 28 August 1996

TOPIC -----

This article describes how to convert a Standard MIDI file (SMF) or karaoke file to QuickTime format.

DISCUSSION -----

If you want to convert Standard MIDI files to QuickTime format, you need to have QuickTime 2.0 or greater installed on your Macintosh computer. If you want to convert karaoke files, you need to have QuickTime 2.5 or greater installed. You should also have the QuickTime Musical Instruments extension installed. You cannot convert MIDI files to QuickTime movies using QuickTime for Windows at this time.

Conversion Procedure For MIDI Files
=====

SimpleText version 1.1.1 or later

- 1) Launch SimpleText
- 2) Select Open from the File menu
- 3) Choose a Standard MIDI file -- The Open button changes to Convert

An additional dialog box appears for the placement of the QuickTime file, which features an "Options" button providing you the ability to change MIDI instrument settings during the transition from the Standard MIDI format to the QuickTime format.

If the file is not a Macintosh Standard MIDI file, when you try to open the MIDI file, SimpleText reads it as a text file. Also, the Open button will not change to Convert.

To force SimpleText to convert the file to a QuickTime MIDI file, you need to change the file Type. The TYPE must be: Midi (the Creator should be either ttxt or Moov)

In order to change the Type of any Macintosh file, you must use a utility application, such as ResEdit that allows you to change the Type and Creator of files.

MoviePlayer 2.x

- 1) Launch MoviePlayer
- 2) Select either Open or Import
- 3) Choose a Standard MIDI File
- 4) Click on Convert. A dialog appears asking the name of the converted file.
- 5) Name the file
- 6) Click Save

The file is converted to a QuickTime movie.

IMPORTANT NOTE FOR QUICKTIME 2.0:

If the MIDI file has a (.) in the filename, it triggers QuickTime to open the file as a Text Track instead of a MIDI Track. To correct this problem, rename the file so it doesn't contain a (.) in the filename. QuickTime 2.5 can convert MIDI files without renaming them.

Converting Karaoke Files

=====

One of the new features in QuickTime 2.5 is the ability to convert and use karaoke file. These files usually have a .kar file extension. You follow the same procedure for converting MIDI files, however there is an additional option for changing the way the text is displayed on the screen. The default screen option is to display the text on a black background with white letters in 12 point Geneva. The text is not anti-aliased.

Changing Text Options

Step 1

After selecting the karaoke file you want to convert, select options in the open dialog.

A new dialog appears with a section for changing the text options in karaoke files.

Step 2

Click the Text Options button.

A new dialog appears with a list of fonts installed on your Macintosh computer. Options for making the text anti-aliased, and changing the background and text colors.

NOTE:

Opening the Text Options can take up to several seconds if you have a lot of fonts installed on your computer.

Step 3

Make any changes to the text you want and Click OK.

The standard Open File dialog appears requesting the name of the file you are saving.

Article Change History:

28 Aug 1996 - Added information on karaoke formatted files.

27 Jun 1995 - Added additional information on converting MIDI files.

Open Transport and Compatibility Mode (9/95)

Revised: 1/4/96
Security: Everyone

Open Transport and Compatibility Mode (9/95)

=====

Article Created: 20 June 1995
Article Reviewed/Updated: 19 September 1995

TOPIC -----

This article describes how the new Open Transport (OT) networking architecture maintains compatibility with older networking schemes.

DISCUSSION -----

In addition to its standards-based APIs (XTI, TPI, and DLPI), Open Transport includes support for many of the existing ("classic") networking and communications APIs to provide backwards-compatibility for existing AppleTalk and MacTCP applications, and for select other networking software.

AppleTalk backwards compatibility

AppleTalk backwards compatibility is accomplished by trapping all networking calls at the ".ddp" driver level. Above the DDP protocol, applications written to the classic AppleTalk APIs are actually running the classic implementations of AppleTalk. When the packets reach the DDP protocol layer, calls to the .ddp driver are intercepted, translated to the corresponding XTI calls, and are passed to Open Transport for processing. The process is reversed for incoming packets (OT receives the packet, native DDP handles the packet, the data is repackaged into an AppleTalk parameter block API, and control is passed back to the upper layer as if it had come from the .ddp driver).

The primary advantage of this approach is that backwards compatibility is very robust. Since the classic implementations of ADSP, ASP, ATP, NBP, ZIP, and so on are all used, we didn't have to attempt a "warts and all" emulation layer. It also turns out that this decreases our overall footprint, as compared to an implementation strategy where we would have tried to trap all packets at the top of the protocol and remap to their OT native counterparts -- that is, there is only the one DDP emulation shim, rather than an ADSP shim, an ASP shim, an ATP

shim, a ZIP shim, an NBP shim, a PAP shim, and so on.

The primary disadvantage of this approach is that backwards compatibility, especially on the Power Macintosh, does not gain any meaningful performance increase for applications running in backward compatibility. Afterall, most of the stack is still running in emulation - only DDP is actually native. And add on top of that the increased cost of the mixed mode context switch from 680x0 to native (or native to 680x0) for each packet handled.

TCP/IP backwards compatibility

TCP/IP backwards compatibility is accomplished by trapping all networking calls at the ".ipp" driver level. Since MacTCP was implemented essentially as a single monolithic driver, this means that there was only one place where networking calls could be intercepted and emulated. Calls to .ipp are trapped, mapped to appropriate XTI calls, and the OT/TCP stack handles the rest. The process is reversed on incoming packets.

The primary advantage of this approach (not that there really was any technical alternative) is performance. The entire handling of the packet happens in the new OT implementation. Especially on Power Macintosh, that means networking goes native as soon as the application makes the call to the driver (well, technically as soon as the emulation shim maps the driver call to the XTI call. The emulation shim still runs as 680x0 code).

The primary disadvantage of this approach is that backward compatibility is potentially less robust. It is a completely new code base for TCP and developers may be depending on idiosyncrasies of MacTCP -- if so, they will probably break.

Other networking compatibility

- DLPI to .enet conversion. Current NuBus Macintosh computers (680x0 and DLPI) have ethernet implementations that rely on the '.enet' driver architecture and API specification. Open Transport, however, expects to communicate only with DLPI drivers. To allow OT to run on NuBus Macintosh computers without requiring the creation of new drivers (that is, to allow existing cards and drivers to be used with OT), we've created an adapter that accepts DLPI calls (from the 'top) and converts them to .enet calls (out the bottom). This is believed to be quite robust (or will be when the next version of OT ships).

- .enet to DLPI conversion. Certain other networking products, including protocols like MacIPX and PATHWORKS DECnet, and certain applications software products, such as Insignia SoftWindows, have been written to bypass AppleTalk and MacTCP, and talk directly to the .enet driver. This is a problem, because early PCI-based Power Macintosh computers will have ONLY DLPI drivers for networking -- no .enet will exist on the Power Macintosh 9500 with the first release of Open Transport.

Later versions of Open Transport will allow these protocols and applications to run on early PCI-based Power Macintosh computers, a special adapter has been created that accepts .enet calls (from the 'top') and converts them to DLPI calls (out the bottom). This software is designed as a stop-gap compatibility measure until new versions of such software can be created for early PCI-based Power Macintosh computers. Because of this, it has two key limitations: it only supports the built-in ethernet adapter (which means that you can't run the current versions of SoftWindows or MacIPX or PATHWORKS on a PCI based networking card); and it does not support promiscuous mode (which means that you can't use an early PCI-based Power Macintosh with the current version of NetMinder or EtherPeek).

There are no other API changes or backward compatibility issues in OT v1.0.

At Ease 3.0: Labels and Views Control Panels Issue (8/95)

Revised: 8/14/95
Security: Everyone

At Ease 3.0: Labels and Views Control Panels Issue (8/95)

=====

Article Created: 20 June 1995
Article Reviewed/Updated: 14 August 1995

TOPIC -----

This article describes an issue with At Ease 3.0 and how the Labels or Views control panels can affect later users.

DISCUSSION -----

At Ease users in the Restricted Finder environment cannot open most control panels, however they can open the Labels and Views control panels.

Below are possible side affects to this access:

- Users may change the name and/or color in the Labels control panel. This control panel changes the items in the Labels menu so the next user may select the Label menu and see unacceptable words that fit into the Label text field.
- Users may change the Font for views in the Views control panel to Symbol, so the file and folder names become unreadable to the next user.
- Users may select Calculate Folder Sizes in the List Views section of the Views control panel, which will cause the computer to calculate the size of each folder in an open window. This selection could slow the computers operations, depending upon how many folders are present and the amount of files/folders in each folder.

Security: Everyone

New bnet Patch For The AWS 95 (6/95)

=====

Article Created: 20 June 1995

TOPIC -----

This article describes the new bnet patch for the Apple Workgroup Server (AWS) 95.

DISCUSSION -----

The AWS 95 bnet patch has been released to the internet. It is in the following folder:

<ftp://abs.apple.com/pub/abs/aws95/patches/bnet>

Read Me

=====

BNET Networking module patch May 13, 1995

This module replaces the existing bnet networking module for A/UX releases 3.1 and 3.1.1. It should not be used with previous releases.

This module has the following functionality changes

1) Fixes a problem in the TCP/IP code that could cause crashes under high load conditions when a remote machine times out a connection.

2) Adds support for traceroute.

To install

1) Copy the existing file "/etc/boot.d/bnet" file to a safe place

2) Put 'bnet' into /etc/boot.d

3) Run 'newconfig' (with no arguments) as root

4) Reboot the system

Color StyleWriter Pro: New Black Ink Tank (8/95)

Revised: 8/28/95
Security: Everyone

Color StyleWriter Pro: New Black Ink Tank (8/95)

Article Created: 20 June 1995
Article Reviewed/Updated: 28 August 1995

TOPIC -----

I tried to order a replacement Color StyleWriter Pro Black Ink Cartridge (M1952G/A) using the information provided in my user's guide, but according to my local dealer it was discontinued by Apple. The cyan, magenta, and yellow cartridges are still available. How do I obtain a replacement black ink cartridge?

DISCUSSION -----

The original Black Ink Cartridge (as specified in the printer's user's guide) was discontinued by Apple so that an improved version with an extended life could be introduced. The new ink cartridge is called the Color StyleWriter Pro Black High Capacity Ink Tank, and it can be ordered using finished goods model number M3822G/A.

The Black High Capacity Ink Tank is slightly larger in size, which nearly doubles the ink carrying capacity for the black ink. The new ink tank design uses extra space next to the black ink tank to allow for the larger ink tank.

LaserWriter 8.3: Desktop Printing & PostScript Fax (6/95)

=====

Article Created: 22 June 1995

TOPIC -----

Is there going to be a LaserWriter 8.3f fax driver for LaserWriter 8.3? I realize that LaserWriter 8.3 mainly provides support for ColorSync 2.0, but I don't want to have to switch between two printer drivers (8.2.2f and 8.3) in the Chooser. I would also like to take advantage of the new "Desktop Printer" capability of LaserWriter 8.3 when faxing from my fax-capable PostScript printers (LaserWriter Select 360, LaserWriter Pro 810, LaserWriter 16/600 PS).

DISCUSSION -----

As of June, 1995 there are no plans to produce a LaserWriter 8.3f fax driver. The latest version of the LaserWriter "f" driver is LaserWriter 8.2.2f which is available in Software Sampler.

Having two different LaserWriter drivers installed and switching between them is in some ways easier. By having both drivers (for example the LaserWriter 8.2.2f and LaserWriter 8.3), if one is set for a specific fax printer and the other for the Color LaserWriter 12/600, then you can select the desired print driver in the Chooser. When the driver is selected, your specific printer is automatically highlighted (if previously selected for that printer driver) so there is no need to "re-choose" or "Setup" the printers when selecting the different drivers.

With regard to desktop printing, the Desktop PrintMonitor software IS compatible with previous versions of the LaserWriter driver (including the fax versions). Thus, LaserWriter 7.x, 8.x, and all QuickDraw print drivers (LaserWriter Select 300, StyleWriter I/II, and so on) that use PrintMonitor are compatible. We tried running a simple PostScript Fax job using LaserWriter 8.2.2f and the Desktop PrintMonitor software; it faxed without problem via a desktop printer we created for our LaserWriter 16/600 PS.

LaserWriter FAX Printer & Rings Before Answering Setting (6/95)

Revised: 6/20/95
Security: Everyone

LaserWriter FAX Printer & Rings Before Answering Setting (6/95)

=====

Article Created: 20 June 1995

TOPIC -----

We are not able to change the number of "Rings Before Answering" using the LaserWriter Fax Utility to any number above 10. We have a LaserWriter 16/600 PS w/fax card, and when we select "Incoming Fax Settings" and type in any number above 10, the LaserWriter Fax Utility states that value has been changed. Selecting "incoming Fax Settings" again shows that the number has defaulted back to the previous number between 1 and 10. The manual states that you can type in a value from 1 to 30.

DISCUSSION -----

You are correct, the only settings possible are between 1 and 10 inclusive. We have reported this problem to engineering for verification.

Our own testing via PostScript code interrogation of the printer indicates that the only fax card values accepted for "Rings Before Answering" are only from 1 to 10 inclusive.

These limits will apply to all Apple Postscript Fax capable printers including the LaserWriter Select 360, LaserWriter Pro 810, and LaserWriter 16/600 PS.

AppleShare For Windows: TCP/IP and Winsock (6/96)

Revised: 6/5/96
Security: Everyone

AppleShare For Windows: TCP/IP and Winsock (6/96)

=====

Article Created: 20 June 1995
Article Reviewed/Updated: 04 June 1996

TOPIC -----

I'm having a problem with AppleShare Client for Windows not working with TCP/IP on a Windows computer. AppleShare runs fine, but an earlier installation of TCP/IP and Winsock no longer function when the AppleShare Client is loaded by the system during startup. The manual that comes with the AppleShare For Windows Client does not address this issue. Have you heard anything about this and a solution to it?

DISCUSSION -----

The solution is to add the following in the Link Support section to the net.cfg file:

```
max stacks 8
```

When you load a packet driver IP stack, the default value of 4 stacks the link support layer (lsl.com) can handle is not enough. Increasing the number of stacks serviced from 4 to 6 or 8 will insure proper operation.

Note: You cannot run AppleShare Client for Windows over TCP/IP, but you can run both TCP/IP and AppleShare Client for Windows off of the same Ethernet card with Windows 3.1 or Windows for Workgroups. AppleShare Client for Windows is not supported for use with Windows 95.

Article Review History:
04 June 1996 - Added note about AppleShare Client for Windows over TCP/IP.

AppleCD 600e CD-ROM Software Read Me (6/95)

Revised: 6/20/95
Security: Everyone

AppleCD 600e CD-ROM Software Read Me (6/95)

=====

Article Created: 20 June 1995

TOPIC -----

This article is the AppleCD 600e CD-ROM Software ReadMe.

DISCUSSION -----

Installing the AppleCD 600e CD-ROM software

If you follow the instructions in the manual for installing the CD-ROM software, but installation is not successful, use the instructions here. Before you begin, make sure there are no CD-ROM discs in any other CD-ROM players connected to your computer. Then follow these steps:

Step 1

Turn on the CD-ROM player by pressing the on/off switch on the back panel of the player.

Step 2

Press the Open/Close button of the CD-ROM player to open the tray.

Step 3

Place the CD-ROM Setup disc in the tray, with the disc label facing up.

Step 4

Push the tray in or press the Open/Close button to close the tray.

Step 5

Start up or restart your Macintosh computer.

Step 6

When the disc icon appears on your screen, double-click the icon to open it.

Step 7

Double-click the Installer icon to open it. The Install dialog box appears. Make

sure the destination disk named is your startup disk. If it's not, click Switch Disk until the correct disk is named.

Step 8

Click Install.

Step 9

When you see a message reporting that installation was successful, click Restart.

That's it. You've installed the CD-ROM software. Make sure to remove the CD-ROM Setup disc after installing the CD-ROM software.

Problems installing with System 7.1 and an AppleCD 300i player

If you are having problems installing the CD-ROM software with System 7.1 and an internal AppleCD 300i player, follow these steps:

Step 1

Restart your Macintosh computer.

Step 2

Hold down the Command, Option, P, and R keys. As soon as you hear the computer restart again, let go of the keys.

Step 3

Go back and repeat the installation procedure above.

Apple Scanner: Frequently Asked Questions (6/95)

Revised: 6/28/95
Security: Everyone

Apple Scanner: Frequently Asked Questions (6/95)

Article Created: 21 June 1995
Article Reviewed/Updated: 28 June 1995

TOPIC -----

This article contains the answers to frequently asked questions (FAQ) about Apple scanners.

Questions in this FAQ:
=====

- What are the current versions of the scanning software?
- Where can I get updates to the current versions of Apple scanner software?
- Are Apple scanners TWAIN compliant? Is there a way to scan directly into Adobe Photoshop?
- How can I scan in text documents for use in a word processor?

DISCUSSION -----

Question: What are the current versions of the scanning software?

Answer: The most current configurations are as follows:

Color OneScanner:
 Ofoto 2.0.2
 Scanner 3.0
 HyperScan 2.0.1

Apple OneScanner:
 Ofoto 2.0.2
 Scanner 2.0

HyperScan 2.0.1

Apple Scanner:

AppleScan 1.0.2

Scanner 2.0

HyperScan 2.0.1

Question: Where can I get updates to the current versions of Apple scanner software?

Answer: You can find the current list of Apple Software Updates in the Apple Technical Info Library (go shortcut "TIL") - use the search string "kol and alphabetical" to locate the article "Apple Software Updates Online: Alphabetical List." This article lists all the updates and their paths.

Question: Are Apple scanners TWAIN compliant? Is there a way to scan directly into Adobe Photoshop?

Answer: Apple scanners are not TWAIN compliant. There are third-party plug-ins available for this purpose, such as Second Glance's Scantastic PS. For more information, contact Second Glance at (714) 855-2331. Also, Look in the Redgate Macintosh Product Registry (shortcut "redgate") for other third-party solutions.

Question: How can I scan in text documents for use in a word processor?

Answer: The process you are referring to is optical character recognition (OCR). Apple does not write any OCR software. However, there are many third-party vendors of OCR software. Check the Redgate Macintosh Product Library (shortcut "redgate") for a list of third-party vendors.

Multimedia: Frequently Asked Questions (8/96)

Article Created: 21 June 1995
Article Reviewed/Updated: 23 August 1996

TOPIC -----

This article contains the answers to frequently asked questions (FAQ) concerning issues with Apple Multimedia products.

Questions in this FAQ:
=====

- 1) Will the closeup lens included with the QuickTake 150 be sold separately for use with the QuickTake 100?
- 2) Since the QuickTake 100 and the QuickTake 150 share the same housing, will there be an upgrade path available?
- 3) What is the difference between the AppleDesign Powered Speakers (M4575LL/A) and the AppleDesign Powered Speakers (M4475LL/B)?
- 4) What is the difference between the AppleDesign Powered Speakers and AppleDesign Powered Speakers II?
- 5) What is the difference between running applications directly from a CD-ROM drive and copying them to the hard disk and running them from there?
- 6) When playing normal audio CDs, sound cuts off regularly even when my computer is not running any other software. AppleDesign Powered Speakers are being used. What is causing this?
- 7) Which AC Adapter can I use with the QuickTake 150 digital camera?
- 8) I have an AppleCD 300e Plus CD-ROM drive and want to use it on a DOS-based PC. Where can I get the drivers for it?

DISCUSSION -----

1) Question: Will the closeup lens included with the QuickTake 150 be sold separately for use with the QuickTake 100?

Answer: The close-up lens attachment is available as a service part from Apple (922-1371). The attachment works with both the QuickTake 100 and QuickTake 150. There are also a number of companies that manufacture close-up lenses for the QuickTake 100. You can search the Redgate Macintosh Product Registry (shortcut "redgate") for possible solutions from third-party companies.

2) Question: Since the QuickTake 100 & QuickTake 150 share the same housing, will there be an upgrade path available?

Answer: There was a QuickTake 100 Upgrade Program in effect from August 2 to November 30, 1995. However, this program is no longer available.

3) Question: What is the difference between the AppleDesign Powered Speakers (M4575LL/A) and the AppleDesign Powered Speakers (M4475LL/B)?

Answer: The difference between these products is the /B speaker includes an output jack for a sub-woofer, which is a low frequency speaker designed to enhance the bass response of small speakers. The /A speaker does not include this jack.

4) Question: What is the difference between the AppleDesign Powered Speakers and AppleDesign Powered Speakers II.

Answer: The AppleDesign Powered Speakers II are slightly smaller than the original AppleDesign Powered Speakers. The AppleDesign Powered Speakers II are designed to stay on all the time and do not have a power switch. There is little difference in sound quality between the AppleDesign Powered Speakers and AppleDesign Powered Speakers II.

5) Question: What is the difference between running applications directly from a CD-ROM drive and copying them to the hard drive and running them from there?

Answer: The main difference is that CD-ROM drive access is much slower than hard drive access. If the application you are running requires frequent access, it will run much more slowly from the CD-ROM drive than from the hard drive.

The CD-ROM disc should contain documentation as to which files you need to copy to your hard drive and which you can run directly from the CD-ROM disc.

6) Question: When playing normal audio CDs, sound cuts off regularly even when my computer is not running any other software. AppleDesign Powered Speakers are being used. What is causing this?

Answer: This is probably due to the noise gate circuitry of the AppleDesign Powered Speakers. The noise gate reduces the amount of noise heard through the speakers while the speakers are just amplifying the sounds from the CPU, such as alert beeps. This noise gate turns off the sound to the speakers when the input level (at the CPU input jack, located on the AppleDesign Powered Speakers) falls below a set voltage level. This circuitry is only connected to the 1/8" stereo jack (CPU Input Jack) and not to the dual phono plugs (CD Stereo Cable Jacks) on the speakers.

You can avoid this through one of the following methods:

Turn Up the Volume

The best way to handle this situation without having to buy any new cables is to turn up the volume in the Sound control panel and use the volume knob on the speakers to control the speakers volume. If you do this, most sound drop outs will be eliminated. During some soft passages, like those found in classical music, the noise gate may still drop the audio.

Use a Different Cable

Using a Y adapter cable from the computer's sound out port to the CD Stereo Cable/RCA Jacks on the speakers will eliminate the sound drop outs, but you will lose the benefits of the noise gate.

You can get a Y adapter cable at electronics stores.

7) Question: Which AC Adapter can I use with the QuickTake 150 digital camera?

Answer: You can use the QuickTake AC Adapter (M2851LL/A) and the Macintosh PowerBook AC Adapter (M4662LL/A) with the camera. Use of other AC adapters could result in damage to the camera.

8) Question: I have an AppleCD 300e Plus CD-ROM drive and want to use it on a DOS-based PC. Where can I get the drivers for it?

Answer: Apple does not write the software drivers for the AppleCD 300e Plus for use on a DOS-based PC. They are written by other developers. When Apple ships a Multimedia Kit for Windows, we include a third-party adapter card. The CD-ROM software comes with that card. The software is only licensed to be distributed with the kit. You may want to look in the Redgate Macintosh Product Registry (shortcut "redgate") to locate possible third-party solution. Corel and Trantor are two possible suppliers of such software.

Japanese Language Kit: Common Troubleshooting Steps (9/95)

=====

Article Created: 21 June 1995
Article Reviewed/Updated: 6 September 1995

TOPIC -----

This document contains the answers to frequently asked questions (FAQ) about the Japanese Language Kit (JLK).

Questions in this FAQ:
=====

- Why doesn't the Installer ask for disk Font 12?
- If I install the Japanese Language Kit (with 24-bit addressing ON) the Installer crashes while merging the TrueType fonts. Why?
- I get unreadable Japanese text on the screen. What's wrong?
- In the Keyboard menu (Diamond Menu) and/or the Pencil menu, the Japanese text is displayed as garbage.
- I double click on a Japanese TeachText file and the data appears as garbage.
- I enter text in Hiragana, but it does not convert to Kanji. Why not?
- Some of my keyboard shortcuts don't work since I installed JLK. What's wrong?
- I use the JLK and when I rename a folder in the Finder, the keyboard menu changes from U.S. System 7 (a blue diamond) to Kotoeri (a red sun with an apple) automatically. If I select U.S. System 7 in the keyboard menu, I can enter the name in English. Why does the keyboard layout switch occur?
- I have a Performa computer and the JLK. Windows such as help and the input window do not show up when I try to enter Japanese text. What's wrong?

DISCUSSION -----

Question: Why doesn't the Installer ask for disk Font 12?

Answer: The SaiMincho and ChuGothic fonts found on Font Disk 12 are available only through a customized installation. These fonts are PostScript compatible bitmaps for use with the LaserWriter NTX-J

Question: If I install the Japanese Language Kit (with 32-bit addressing OFF) the Installer crashes while merging the TrueType fonts. Why?

Answer: This ONLY happens when installing on Macintosh computers (Macintosh II, IIfx, SE/30, IIfx) that also have the 32-bit System Enabler installed. Turn ON 32-bit addressing in the Memory Control Panel while installing the Japanese Language Kit with these types of Macintosh computers (Macintosh II, IIfx, SE/30, IIfx).

Question: I get unreadable Japanese text on the screen. What's wrong?

Answer: If you see unreadable Japanese text, check the following basic points to make sure the Japanese fonts system is complete:

- a) The fbit/fdef Kanji bit-map fonts (the one with the Kanji character "kan" and the circle behind its icon) are located at the System Folder root level (not Fonts folder). At minimum, the Osaka font must be installed
- b) The InputBackSupport extension is present in the Extensions folder.

Question: In the Keyboard menu (Diamond Menu) and the Pencil menu the Japanese text is displayed as garbage.

Answer: This is normally caused by NOW Menus or some other menu management program. The menu program overrides the system menu font and forces the menu into a specific font. The menu font needs to be changed to the Osaka font in this menu program.

Question: I double click on a Japanese TeachText file and the data appears as garbage.

Answer: The English version of TeachText opened the document instead of the Japanese version. The only work around is to open the Japanese version of TeachText, then open the file from within TeachText. Alternatively, you can use SimpleText, which is WorldScript savvy.

Question: I enter text in Hiragana, but it does not convert to Kanji. Why not?

Answer: The Main dictionary needs to be opened in the JLK preferences.

Question: Some of my keyboard shortcuts don't work since I installed JLK. What's wrong?

Answer: System 7.1 or later uses the sequence Command-Option-Spacebar to switch keyboard layouts. Other applications or utilities like QuickKeys may also attempt to use this key combination. The System Software takes precedence in all cases so you have to find an alternative for the conflicting program.

Question: I use the JLK and when I rename a folder in the Finder, the keyboard menu changes from U.S. System 7 (a blue diamond) to Kotoeri (a red sun with an apple) automatically. If I select U.S. System 7 in the keyboard menu, I can enter the name in English. Why does the keyboard layout switch occur?

Answer: Apple Language Kits provide Finder support for English and the language each installs. When you modify a file or folder name, the language kit defaults to its primary keyboard layout. Japanese defaults to Kotoeri. This is how that default is selected: The JLK displays keyboard layouts based on the "Font for views" selected in the Views Control Panel. When Osaka is selected, the keyboard menu displays "U.S. System 7" and Kotoeri, because Osaka supports both Japanese and Roman character sets. Selecting a Roman-only font like Palatino or Helvetica only displays "U.S. System 7" in the keyboard menu.

Question: I have a Performa computer and the JLK. Windows such as help and the input window do not show up when I try to enter Japanese text. What's wrong?

Answer: If you have System 7.1P4 or later, open the Performa Control Panel and turn off Finder Hiding. Then restart your computer to enter Japanese through the input window. If you have System 7.1P3 or earlier, remove the Launcher from the Control Panels folder, and place it in the Startup Items folder. Restart your computer; Finder Hiding is deactivated.

Send message to: listproc@whoville.austin.apple.com

message: unsubscribe infoalley

You'll receive an automated reply letting you know you've been removed from the list.

Information Alley Contents

=====

The contents of Information Alley come from Apple's Technical Information Library (TIL). This library consists of over 12,000 articles related to Apple products and technologies. The TIL is available through various online sources including: America Online, CompuServe, AppleLink, the Internet: (gopher) or World Wide Web.

Where to Find the Information Alley

=====

The Information Alley is available free to anyone through a variety of online services and Internet list server capability. Below is a current list of the online services where the Information Alley is posted.

For a complete list of where to find the Information Alley, search the TIL with "information alley" or "kol" as the search string. Select article title "Information Alley: Where to Find Online".

Important Information About Virtual Memory

Tips

====

Apple Printers

The Apple LaserWriter 300 and Apple Personal LaserWriter LS printers are not yet compatible with the Power Macintosh 9500. An upgrade will be available soon on Apple Online Services.

How to Reconnect to a Lost Server

If you unexpectedly lose a connection to a server on which you have items in use, the server's icon appears dimmed on the screen. If you double-click the dimmed icon or choose the server from the Recent Servers item in the Apple menu, you get a message saying that the disk could not be opened because you do not have enough access privileges. Before you can reconnect to the server, you must close any open files, and then drag the server's dimmed icon to the Trash. If you need to save your work on an open file, use Save As to save it on a different disk.

GeoPort Software

The GeoPort software 2.0 and earlier is not compatible with your Power Macintosh 9500. Users should upgrade to Apple Telecom 2.1 or later software. This version will be compatible with all the current GeoPort pods on the market and is available via online services including AppleLink, online services, and the internet.

Troubleshooting

=====

Open Transport and MacTCP

After you install new software on your hard disk, if you have problems with your TCP/IP applications, look in the Control Panels folder for a MacTCP file. If one is there, remove it from the Control Panels folder and restart your machine. This procedure should enable your TCP/IP applications to work properly.

Each time you install a new application program, you may want to verify whether or not the software's installer also installed MacTCP, and follow the above procedure if necessary.

Incorrect "Guide" File Balloons

System 7.5.2 includes Apple Guide documents which provide the on-screen instructions and other information that you need to help you use your computer. However, if you turn on Balloon Help (by choosing Show Balloons from the ? menu) and point to a Guide file icon on the hard disk, the balloon may give you the wrong information about where the file belongs or what you can do with it. To avoid being misled by incorrect balloons, follow the guidelines below:

- Leave Guide files where they are. Some Guide files (for example, the Guide file named "Macintosh Guide") belong in the Extensions folder. Others will not work if they are put into the Extensions folder.
- Keep application programs that have Guide files in the same folder as the Guide file. For example, keep the file named "File Assistant Guide" in the same folder as the File Assistant program. If you move a Guide file that belongs with an application program, you won't be able to get help while using the program.

QuarkXPress

To use QuarkXPress with System 7.5 on a Power Macintosh, you must upgrade to QuarkXPress version 3.3.1 or later. For upgrade information, contact Quark, Inc.

The Assistant Toolbox and Non-Networked Printers

If the Assistant Toolbox extension is installed on your computer, the Print Later option (LaterLaser) works only with networked PostScript printers. If you are printing on a non-networked printer—particularly a LaserWriter Select 310—you should open the Extensions Manager control panel and turn off the Assistant Toolbox extension.

Help with the Japanese or Chinese Language Kit

To use this software effectively, use version 1.2 (or later) of the Japanese Language Kit and version 1.1.1 or later of the Chinese Language Kit. In the United States, you can obtain an upgrade by calling the Apple Order Center.

AppleShare Server Software version 4.1**

If you purchase AppleShare server software version 4.1, make sure to choose Custom Install (instead of Easy Install) when you install it.

**NOTE:

This note is not included in the original ReadMe File.
AppleShare 4.1 is not supported on the Power Macintosh 9500. This section of the ReadMe file is referring to the client portion of the AppleShare installation. At the time of this writing, there is no tested or supported version of AppleShare Server software available for the Power Macintosh 9500 family of computers.

Printing with Apple PhotoFlash

If you have problems printing images with the PhotoFlash software, make sure that you choose a printer in the Chooser before you choose the Print command

from the File menu.

Using PowerTalk and PowerTalk Direct Dialup Mail

If you use PowerTalk Direct Dialup Mail and have trouble sending a fax, it may be because both Direct Dialup and STF PowerFax PE are set to auto-answer. To turn off STF auto-answer, open the STF Setup window and set 'n' to "never" (in the "Answer on 'n' rings" section).

Important Information About Macintosh PC Exchange

=====

Apple File Exchange and Macintosh PC Exchange

The Apple File Exchange software is not compatible with PC Exchange and should not be used while PC Exchange is installed. Version 2.0 of PC Exchange contains an easier and more intuitive method for accessing DOS and Apple II ProDOS disks on a Macintosh.

AutoDoubler

To use AutoDoubler with Macintosh PC Exchange, you must first open the AutoDoubler control panel and turn off the "Show DD on Compressed Files" option.

Compressed PC Disks and Files

Macintosh PC Exchange does not work with DOS-format floppy disks or SCSI hard disks that have been compressed using Stacker or other DOS or Windows disk-compression utilities. Before transferring compressed DOS files to a Macintosh, you must decompress the files and save them to a noncompressed DOS-format floppy disk.

Working with PC-Format Disks Containing Multiple Partitions

If a SCSI hard disk or removable media cartridge has been formatted to contain multiple partitions, you can use PC Exchange to mount the Macintosh-, DOS-, or ProDOS-format partitions as individual logical drives on the Macintosh desktop. If the disk contains both Macintosh and DOS-format partitions, PC Exchange will only recognize the Macintosh partition. In addition, PC Exchange will only recognize ProDOS-format partitions on SCSI hard disks that are less than 32 megabytes.

You can use PC Exchange to erase existing individual partitions on a SCSI hard disk or removable media cartridge if they have the same format. However, you cannot use PC Exchange to reformat and resize individual partitions contained on the disk. Nor can you format a Macintosh-format hard disk or removable media cartridge as a DOS-format disk. To resize or reformat multiple Macintosh, DOS, or ProDOS partitions, you need to use third-party software designed for partitioning hard disks and removable media cartridges.

Working with DOS-Format SCSI Removable Media Devices

In order for PC Exchange to recognize SCSI removable media devices, you must turn on the device and eject any cartridges before you turn on your Macintosh system.

Do not install the device driver software that came with your removable media device. Instead, open the PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your Macintosh. PC Exchange will install its own device driver for that SCSI device.

The Eject Disk command is unavailable when you are working with removable media devices. To unmount and eject a removable media cartridge, drag the device's icon to the Trash. Once the device has spun down and the red light goes out, you can manually eject the cartridge from the drive. To access a removable media cartridge that has been ejected, simply reinsert the cartridge in the drive.

When initializing and formatting Bernoulli and SyQuest cartridges on a PC-compatible computer, use the disk setup and partitioning software that came with the SCSI controller card installed in your PC or that came with your Bernoulli or SyQuest device. Do not use the MS-DOS Fdisk command to initialize a removable media cartridge. In addition, you should use the MS-DOS Format command to format the disk before you copy DOS files to a newly initialized removable media cartridge on a PC.

When you initialize a removable media cartridge on a PC-compatible computer, you must fully partition, initialize, and erase the cartridge using the software that came with your SCSI controller card or removable media drive. If you do not, PC Exchange may not recognize the new DOS-format partitions on that cartridge.

Working with DOS-Format SCSI Hard Disk Drives

In order for PC Exchange to recognize SCSI hard disk drives, you must turn on the drive before you turn on your Macintosh.

Do not install the device driver software that came with your removable media device. Instead, open the PC Exchange control panel, click the Options button, select your SCSI device from the list, and then restart your Macintosh. PC Exchange will install its own device driver for that SCSI device.

When initializing and formatting an external SCSI hard disk on a PC-compatible computer, use the MS-DOS Fdisk command or the disk setup and partitioning software that came with the SCSI controller card installed in your PC. In addition, you should use the MS-DOS Format command to format and erase the disk before you copy DOS files to a new SCSI hard disk on a PC.

Tips and Problems

=====

- A "Sad Mac" error may occur on your Macintosh if a removable media cartridge is left in the drive during startup. To keep this problem from occurring, manually eject removable media cartridges from the drive before you turn on your Macintosh.

- PC Exchange cannot recognize SCSI hard disks, removable media devices, or drive container files that contain more than one gigabyte of disk space.

Important Information About Virtual Memory

=====

Virtual memory (VM) is a feature of the Macintosh that lets you use part of your hard disk as additional memory. If you are using an application program designed especially for Power Macintosh computers (often called a "native" application program), turning on virtual memory may help you avoid running out of memory.

Your computer comes with virtual memory turned on. With virtual memory turned on, a Power Macintosh program uses less memory than when virtual memory is turned off. If you check the program's Get Info box before and after turning on virtual memory, you'll see that the numbers in the Memory Requirements box change. That is because turning on virtual memory allows the program to use memory more efficiently.

If you notice performance problems using certain applications, you may want to turn off virtual memory. For information on how to turn virtual memory on and off, choose Macintosh Guide from the Guide (question mark) menu, and click the Memory topic area. Then click "How do I use hard disk space as memory?" and "How do I manage Power Macintosh memory?"

For best performance, try setting virtual memory to no more than 50% more than the amount of physical memory (RAM), or no more than 50% of your currently available hard drive space, whichever number is lower. For example, if your computer has 16 MB of RAM and your hard drive has 50 MB of available space, set virtual memory to a maximum of 24 MB (150% of 16, which is less than 50% of 50).

To improve performance, you can also add physical memory (RAM) to your computer. See the user's manual that came with your computer for more information.

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center's phone number.

These articles can help you locate the software update mentioned here:

Macintosh 630 Family: Sound Specifications (6/95)

Revised: 6/21/95
Security: Everyone

Macintosh 630 Family: Sound Specifications (6/95)

=====

Article Created: 21 June 1995

TOPIC -----

What are the sound output and input specifications for the Macintosh 630 series computers?

DISCUSSION -----

The level at the sound output jack is nominally 0.5 volts RMS into 39 ohms. This makes it suitable for either headphones or line-level applications. If a load of less than 39 ohms is connected, clipping of the output waveform can result. So, if both the front and rear sound output jacks are to be used simultaneously, the combined impedance must not be below 39 ohms.

Sound input impedance is 100k ohms. Average line level is 100 mV RMS. Average microphone level is 70 mV RMS, and the maximum input level is 1.8 V RMS.

Easy Access: Features and How to Use (7/95)

Revised: 7/19/95
Security: Everyone

Easy Access: Features and How to Use (7/95)

Article Created: 22 June 1995
Article Reviewed/Updated: 19 July 1995

TOPIC -----

This article describes the features of the Easy Access control panel.

DISCUSSION -----

Easy Access is a control panel intended to help physically challenged users interact with their computer.

Easy Access is a control panel intended to help physically challenged users interact with their computer. Easy Access lets you:

- Set the computer so you can control the pointer from the numeric keypad instead of using a mouse (Mouse Keys)
- Type keyboard shortcuts without having to press the modifier keys at the same time (Sticky Keys)
- Type very slowly (Slow Keys)

You can activate these modifications using preassigned keyboard shortcuts or by opening the Easy Access control panel.

Mouse Keys -- Controlling the Pointer from the Keyboard

Within the Easy Access Control Panel is a feature called Mouse Keys. You can use the numeric keypad on the right-hand side of the keyboard (instead of the mouse) to control the movement of the pointer on the screen.

To turn Mouse Keys on, press Command-Shift-Clear (the Clear key is on the numeric keypad.)

To turn Mouse Keys off, press Clear.

With Mouse Keys on, you can click, drag, and perform all the usual mouse actions from the numeric keypad. The 5 key serves as the mouse button: press once to click; press twice to double-click. The 0 key locks the mouse button down for dragging. The decimal point key (to the right of 0) or the 5 key unlocks the mouse button. The numbers 1, 2, 3, 4, 6, 7, 8, and 9 move the pointer on the screen.

You can adjust how quickly the pointer moves on the screen and how long the delay is before the pointer starts moving when you press a mouse key. You can make these adjustments in the Easy Access Control Panel.

Sticky Keys -- Making Keyboard Shortcuts Easier to Type

=====

The Easy Access Control Panel also includes a feature called Sticky Keys. You can type keyboard shortcuts (such as Command-S for Save) without actually pressing the keys simultaneously.

To turn Sticky Keys on or off, press the Shift key 5 times without moving the mouse.

With Sticky Keys on, you can type a keyboard shortcut by first pressing the modifier key (Command, Control, or Shift) and then pressing the character key. An icon in the right end of the menu bar (to the right of the Application menu icon) changes to indicate whether Sticky Keys is on and whether a modifier key has been pressed or locked.

You can have Sticky Keys make an alert sound when a modifier key is pressed. You set this option in the Easy Access Control Panel.

Slow Keys -- Adjusting the Keyboard for Very Slow Typing

=====

Within the Easy Access Control Panel is a feature called Slow Keys. You can type very slowly and the computer ignores accidental keystrokes by delaying the acceptance of the next keystroke.

To turn Slow Keys on or off, hold down the Return key for about 4 seconds, until an alert sound indicates that the feature is on or off.

You can adjust how long you want Slow Keys to delay acceptance of the next keystroke. You can also set Slow Keys to make an audible click each time a key is pressed. You make these adjustments in the Easy Access Control Panel.

Easy Access only works if it is in the Control Panels folder inside the System Folder when the Macintosh starts up.

TOPIC -----

Can I use a GeoPort with my new Power Macintosh 7200, 7500, 7600, 8500, and 9500?

DISCUSSION -----

The Power Macintosh 7200, 7500, 7600, 8500, and 9500 can use a GeoPort Telecom Adaptor with Apple Telecom 2.1 or later software. If you are using a GeoPort Telecom Adapter on these Power Macintosh models, you must disable LocalTalk. To do this, disconnect any devices attached to the printer port (except serial printers, which can remain attached).

System 7.5.2: Available for Earlier Macintosh Computers? (4/96)

=====

Article Created: 21 June 1995
Article Reviewed/Updated: 10 April 1996

TOPIC -----

I heard that Apple has released System 7.5.2 on its PCI-based Power Macintosh computers. I was wondering if and when Apple will make it available as an upgrade to System 7.5.1?

DISCUSSION -----

System 7.5.2 is a hardware specific release that currently runs on the new Power Macintosh 7200, 7500, 8500, and 9500 systems, as well as the PowerBook 190, 2300, and 5300 computers. System 7.5.2 is based on System 7.5.1 with specific enablers for each of these systems. The components of this release do not function on earlier Macintosh systems.

However, many of the new technologies included in System 7.5.2 have been included in the recent system update, System 7.5 Update 2.0, which you can use on these and earlier Macintosh computers. After installing System 7.5 Update 2.0, you will have System 7.5.3 installed on your computer.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.

System 7.5: Improper Shutdown Notification (11/96)

Revised: 11/5/96
Security: Everyone

System 7.5: Improper Shutdown Notification (11/96)

Article Created: 22 June 1995
Article Reviewed/Updated: 5 November 1996

TOPIC -----

Can you explain the operation of the shutdown check warning in System 7.5 and in pre-System 7.5 Performa system software?

DISCUSSION -----

System 7.5.x
=====

In System 7.5.x, the General Controls control panel uses the Notification Manager to issue the message about improper shutdown. The file called General Controls Prefs in the Preferences folder is where the current checkbox setting of whether to issue the notification is kept.

During a normal shutdown or restart the Shutdown Check file is deleted by the Finder. When the General Controls control panel initializes, it looks for the presence of the Shutdown Check file. If it is found, then a crash situation is assumed. The found Shutdown Check file is kept and made invisible, if it is not already. If the Shutdown Check file is not found during startup, a new one is created. The creation time and date of the Shutdown Check file is the approximate startup time of the last successful startup for the System Folder of the startup volume.

Developer guidelines evangelize that dialogs not be issued during an extension loading time. This is why you do not see the notification as the General Controls control panel loads. The approved method for issuing messages from extensions is the Notification Manager. General Controls posts the improper shutdown warning notification to be displayed as the Finder comes up.

The notification message could be misleading if you switch between multiple startup volumes. For example, you set the startup volume to be another volume other than the current volume. Before restarting normally you crash, and the computer starts up from the newly selected startup volume. You then operate from

this new startup volume for a number of days. Finally you choose the original volume to startup from in the Startup Disk control panel and restart. The old Shutdown Check file is now found by the General Controls control panel and the system realizes that it was not shutdown properly the last time.

Another similar example might be after a crash, if you start up from a floppy disk. Restarting from the floppy-based System Folder does not generate an improper shutdown notification, but when you return to starting from the hard drive the warning notification is issued.

You should interpret the warning notification based on whether the current volume being booted from had shutdown normally the last time it was active.

Pre-System 7.5

=====

Prior to System 7.5, the Performa control panel was used on Macintosh Performa computers to determine if the computer had been shut down correctly or not. The Performa control panel also created an invisible file to monitor the proper shutdown process, but this file was called the Performa Shutdown Check and was located in the Preferences folder within the System Folder.

Sometimes this preference file would become corrupted creating bogus improper shutdown messages. In other words, even if you had shut down properly the computer would report that you had not. In these cases, deleting the Performa Shutdown Check and Performa Preferences files will resolve this issue. Both files are located in the Preferences folder.

You need to trash the Performa Shutdown Check file and the Performa Preferences file. These files are located within your Preferences folder within your System Folder on your hard disk. Once you have trashed these items, restart the computer.

Power Macintosh: Video Blinking At Startup (10/96)

Revised: 10/16/96
Security: Everyone

Power Macintosh: Video Blinking At Startup (10/96)

Article Created: 26 June 1995
Article Reviewed/Updated: 16 October 1996

TOPIC -----

I noticed when my Power Macintosh 9500 series computer is starting up that the screen blinks off and on for a second during the startup process. Is this normal or is there something wrong with my computer?

DISCUSSION -----

The video blinking or flash is normal behavior for a PCI-based Power Macintosh computer and does not indicate a hardware problem. The flash will occur on Power Macintosh 7200/7500/8500/9500 computers.

The reason that the video goes blank for a short time at startup is the video card initially uses the driver contained on the ROM of the video card. Early in the startup process, a newer video driver is swapped in from either the Graphic Accelerator extension in the 9500 series or ROM of the 7200/7500/8500 series computers. It is during the swapping of the video driver that the flash occurs. This is normal.

A consequence of the new driver loading is if you have installed a custom StartupScreen in the System Folder, the system will startup with the custom screen, flash, and then display a grey screen for the rest of the startup sequence. At the time of this article, it is not possible to get a startup screen to remain visible throughout the startup process.

You can verify the driver swap is causing the issue you are experiencing by forcing the Power Macintosh to use the first video driver contained in ROM. This is done by holding down the Command-Shift-N-D keys at startup. You will notice that the video 'blanking' does not occur because the video driver is not being swapped.

This troubleshooting tip can be helpful for a couple of reasons:

..TIL18012-Power_Macintosh-Video_Blinking_At_Startup_10-96.pdf

- It can be used to demonstrate that the video driver is actually being swapped because it does not 'blink' when the video driver on ROM is used.
- If the 'software' video driver on the Power Macintosh 9500 is corrupt for some reason you can revert back to the video driver in ROM to determine where the problem might be (that is, it can be corrupt software or a bad card).

IMPORTANT: Since the video driver in the "Graphic Accelerator" extension contains a newer video driver, you should only bypass this video driver for troubleshooting purposes. Running the system off the ROM based video driver continually may produce unpredictable results.

LaserWriter: Toner cartridge life (12/96)

Revised: 12/9/96
Security: Everyone

LaserWriter: Toner cartridge life (12/96)

Article Created: 26 June 1995
Article Reviewed/Updated: 9 December 1996

TOPIC -----

Why is there such a difference between the rated life of the LaserWriter toner cartridges and the actual life that I experience?

DISCUSSION -----

It is nearly impossible to provide accurate toner cartridge life information because there are many variables affecting the toner requirements for a document. The formatting of the document, font type, and the inclusion of graphics significantly change the toner requirements.

To provide information about the average life of a toner cartridge, many manufacturers provide consumers with the expected number of pages that can be printed assuming a specific toner density. For instance, the LaserWriter 16/600 PS toner cartridge is expected to last 6,000 pages at 5% coverage. An average double-spaced Letter or A4 page using a single, monospaced font has a density close to 5%. Making a simple modification to the document, such as changing the font or making it bold, may increase the actual density value to 6% or 7%. Changing from a double-spaced to a single-spaced format doubles the amount of toner used.

Because most customers print a variety of different documents, the actual page life of a toner cartridge may vary significantly. For example, with a page density of 5%, the LaserWriter 16/600 PS has a rated life of 6,000 pages. However, if a solid black page (100% density) is printed, then the cartridge will run out of toner after approximately 300 pages [6,000 pages/(100%/5%)]. It is unusual to print solid black pages during normal use so most customers will experience a toner life somewhere between the two extremes.

Many laser printers also have the capability to adjust the toner density using a manual adjustment or software tool such as the Apple Printer Utility. Consult the printer's manual for more detailed information on changing the settings.

The chart below provides the approximate number of pages for the toner cartridges in each of these LaserWriter printers listed.

Begin_Table

Printer	Part#	Yield (5% coverage)
LaserWriter Pro 810 (Extended Capacity)	M3602G/A	13,000
LaserWriter Pro 600, 630, and 16/600 PS	M2473G/A	6,000
LaserWriter 12/640 PS	M4683G/A	6,000
LaserWriter II series	M6002 (new)	4,000
	M2795G/A (remftd)	4,000
LaserWriter Select 300, 310, and 360	M1960G/A	4,000
LaserWriter and LaserWriter Plus	M0180	4,000
Personal LaserWriter LS, SC, NT, and NTR	M0089LL/A	3,000
Personal LaserWriter 300, 320, and 4/600 PS	M2045G/A	3,000
Color LaserWriter 12/600 PS	Cyan M3757G/A	4,000
Color LaserWriter 12/660 PS	Magenta M3760G/A	4,000
	Yellow M3758G/A	4,000
	Black M3756G/A	4,000

End_Table

Article Change History:

09 Dec 1996 - Added Color LaserWriter toners.
 20 Jun 1996 - Added LaserWriter 12/640 PS information.
 20 May 1996 - Added table with approximate yields.

Color LaserWriter 12/600 PS: Maximum Page Count (6/95)

Revised: 6/26/95
Security: Everyone

Color LaserWriter 12/600 PS: Maximum Page Count (6/95)

Article Created: 26 June 1995

TOPIC -----

What is the maximum page count value for the Color LaserWriter 12/600 PS?

DISCUSSION -----

The maximum page count for the Color LaserWriter 12/600 PS is a 32-bit number with a maximum value of 4,294,967,296.

This value could be reached in approximately 1,047,553 days (2,870 years) assuming these conditions:

- Maximum throughput of 3 pages per minute
- 30 second pause to reload paper every 250 pages
- Overhead for replacing the consumables
- Printing occurring 24 hours per day
- Daily output of 4,100 pages per day

This estimate does not take into account the fact that the printer is rated to print a minimum of 300,000 black and white pages, or 150,000 color pages.

System 7.5 Update 1.0: Finder Update Message (6/95)

Revised: 6/26/95
Security: Everyone

System 7.5 Update 1.0: "Finder Update" Message (6/95)

=====

Article Created: 26 June 1995

TOPIC -----

After reinstalling System 7.5, the following message is displayed after the desktop appears:

"The system extension "Finder Update" cannot be used, because it is too new."

There does not seem to be any problem as the computer seems to operate properly after clearing the dialog box. What does this message mean?

DISCUSSION -----

This message is a result of having reinstalled System 7.5 over System 7.5.1 and not reinstalling the update. The solution is to install the System 7.5 Update 1.0.

System 7.x: Double-Clicking on Extensions(6/95)

Revised: 6/26/95
Security: Everyone

System 7.x: Double-Clicking on Extensions(6/95)

=====

Article Created: 26 June 1995

TOPIC -----

Whenever I double-click on an extension, I get an error message that states:

"This file adds functionality to your Macintosh. To add this file's functionality to your Macintosh, place the file in the Extensions folder and then restart the computer."

But when I do this, and then double-click on the file again, I get the same message! What's wrong?

DISCUSSION -----

Extensions modify (extend) the operation of your system software. They are programs which are automatically loaded by the system at startup time.

Extensions, as with many other items in your System Folder, are not designed to be double-clicked on, and you will not be able to use them by trying to open them.

The error message you are seeing is generic, and will be generated whenever you double-click or try to open an extension, no matter where you double-click on it.

ColorSync 2.0: White Paper (1 of 2) (4/97)

Revised: 4/28/97
Security: Everyone

ColorSync 2.0: White Paper (1 of 2) (4/97)

Article Created: 26 June 1995
Article Reviewed/Updated: 9 April 1997

TOPIC -----

This article contains part 1 of the ColorSync 2.0 White Paper.

DISCUSSION -----

ColorSync 2.0 Overview
=====

ColorSync 2.0 is a second-generation color management system from Apple Computer, Inc. ColorSync 2.0 will fulfill the promise of desktop publishing-from plain-paper office documents to glossy, high-quality magazines and books-by making available stunning, easy-to-use color.

The Evolution of Color
=====

With the advent of low-cost color printers and other devices, color has become available to a much larger audience. However, a key element has been missing that prevents color from becoming an easy-to-use tool. This missing piece is a system for automatically ensuring color fidelity between devices. ColorSync 2.0 is the crucial piece of technology that will make working with color easy, fast, and consistent. This is accomplished by providing an open architecture and a powerful method for exchanging and matching color information between input devices, displays, applications, and output devices.

ColorSync 2.0 is designed to remove the frustration associated with using color. Different people have different uses for color, ranging from a chart in a presentation to a glossy, six-color annual report. ColorSync 2.0 provides solutions for many of the different uses of color, while delivering an open architecture for those who need special tools.

Business and desktop publishing color users will love the simple plug-and-play nature of ColorSync 2.0. By selecting applications and color peripherals that support ColorSync, such as Apple color displays and printers, they can enable automatic matching of colors between the screen and the printer. ColorSync 2.0 removes the guesswork involved in using color.

ColorSync 2.0 provides powerful tools that are essential in the commercial publishing and prepress markets. High-end users, such as service bureaus, trade shops, and printers, require color solutions that produce the most accurate color reproduction while still supporting existing tools and work flows. ColorSync 2.0 provides one of the fastest, most accurate color-matching systems available on any personal computer system today. And it's an open system, allowing third-party tools to extend its capabilities.

Finally, ColorSync 2.0 offers substantial benefits for developers. Now there's a standard architecture and profile format for color matching on the desktop that delivers the solution that users have asked for. No more decisions about which applications programming interface (API) and profile format to use, or time wasted writing custom routines. The ColorSync 2.0 API provides the most powerful "plumbing" for color management.

Features of ColorSync 2.0

=====

ColorSync 2.0 is more than a simple follow-up to ColorSync 1.0. It has been redesigned based on feedback from customers, developers, and industry experts. While Apple has retained the simplicity of ColorSync, fundamental changes have been made to improve its architecture and performance. Some of the improvements ColorSync 2.0 has to offer are:

- Higher quality, higher performance transformation engine

ColorSync 2.0 provides a default color-matching method (CMM), which transforms color information between documents. This CMM was developed in conjunction with one of the world's leading manufacturers of prepress hardware and software. It provides excellent quality and performance, as well as compatibility with CMMs from other companies.

- Expanded, compatible architecture

The ColorSync 2.0 architecture has been expanded to support a wider array of functions, as well as third-party products, such as alternate CMMs.

- ICC profile compatibility

ColorSync 2.0 supports profiles which conform to the International Color Consortium (ICC) profile specification including ColorSync 2.0 profiles. The ICC profile format is an industry standard, allowing the same device profiles to be used across multiple platforms. In addition, these profiles contain more information than ColorSync 1.0 profiles, enabling higher quality color-matching results.

- Support for PostScript Level 2 devices

The Apple LaserWriter 8.3 driver supports ColorSync 2.0 for printing to color PostScript devices. This allows all devices with ICC-compatible profiles to work with ColorSync 2.0.

- Support for more than four-color devices

ColorSync 2.0 adds support for devices and processes that use more than the four process colors, such as Hi-Fi color printing. This is extremely powerful for prepress users who often have five- and six-color jobs. Support for more than three-color input devices has also been added, allowing for up to eight colors on input and output.

- Increased performance

ColorSync 2.0 is PowerPC native and provides excellent throughput, especially on Power Macintosh machines. Preliminary benchmarks show that ColorSync 2.0, running on a Power Macintosh 8100/80, can transform a 4-inch x 5-inch image at 300 dots per inch (approximately 5.5 megabytes in size) from one color space to another in approximately 5 seconds, more than five times faster than ColorSync 1.0.

- Increased application support

Most of the top publishing applications will offer support for ColorSync 2.0, providing users with a complete solution from start to finish. Every day, more developers are choosing to support ColorSync 2.0.

Hardware and System Requirements

=====

ColorSync 2.0 is system-level software, so no special hardware is necessary. However, ColorSync does require certain baseline hardware and software configurations to perform properly. ColorSync 2.0 is fat binary; it supports both 68000-family and PowerPC processors.

Minimum requirements:

- A 68020 or later processor, or
- A PowerPC 601 or later processor
- System 7.1 or later
- A hard disk drive
- A system with a minimum of 5 megabytes of RAM
- Color display with 8-bit or higher color support
- ColorSync 2.0 (or ICC-compatible) profiles for installed peripherals
- A supporting printer driver, such as the Apple LaserWriter 8.3 version driver

Compatibility

=====

ColorSync 2.0 is backward-compatible with ColorSync 1.0. This means that any application, driver, or CMM that implements ColorSync 1.0 will function normally

with ColorSync 2.0 installed. In addition, ColorSync 2.0 supports the International Color Consortium (ICC) profile standard. This ensures that devices with ICC profiles are compatible with ColorSync 2.0.

QuickDraw GX versions 1.1 and later integrate ColorSync 2.0 for color-matching functions. Users of QuickDraw GX have the added benefit of accurate color matching.

ColorSync 2.0 will be available with several Apple products, including peripherals, computers, and system software updates. Look for the ColorSync logo on popular applications and peripherals.

As it has done with other system extensions in the past, Apple will offer developers the option of licensing ColorSync 2.0 for applications they are developing that may benefit from ColorSync 2.0.

Why Is Color Management Needed?

=====

Why don't the colors on the display match the colors that come out of the printer? How come digital proofs look different from film proofs? There are many reasons, based in complex color science, why the appearance of a color image is difficult to predict. In many ways, communication in color has problems similar to those with communication in languages. Each device is like a person, speaking his or her own language. When one device that speaks French attempts to communicate with another device that speaks Japanese, there is a breakdown, and the message isn't communicated. What's needed is an interpreter that is capable of interpreting the language as well as the dialect, to ensure that the message is properly communicated.

There are two basic concepts to understand when working with color. The first is how devices reproduce color, and the second is how desktop devices communicate in color.

Each device that is capable of reproducing color has a range of colors that it can accurately reproduce, better known as the gamut. Each type of device, such as a display or printer, has a unique gamut. A device's gamut is a subset of a larger standard area of color, known as a color space. Different types of devices work in different color spaces. For example, displays work in a different color space than do printers. It is important to understand the impact that gamuts and color spaces have on color reproduction and the types of work that are being produced on the desktop. This is easily illustrated by a familiar problem: The colors selected on a display may be much brighter and more saturated than the color that comes out of the printer. The reason for this may be that the color selected on the display is in gamut for the display, but is not in gamut for the printer. The gamuts of desktop devices, such as displays and printers, are relatively small when compared with the visible spectrum of light.

The second problem exists in the method that desktop devices communicate with each other. Before the evolution of desktop publishing, special-purpose, computer-based systems were used for many of the tasks involved in color publishing. These were known as color electronic publishing systems, or CEPS.

CEPS offered many benefits over the traditional processes of color printing, such as improved quality and accuracy, and a complete solution from a single vendor. However, they required an enormous investment in equipment and training, as well as functionality limited to a single task for each computer. These factors limited the widespread use of color, leaving it in the control of experts.

The desktop publishing revolution delivered tools that reduced the complexity and cost of publishing. And a single desktop computer could perform a wide variety of tasks. Today color is used more widely than ever before. Quality color devices, such as color printers and scanners that were previously extremely expensive, now cost less than \$500.

Suddenly the tools for the in-house creation of color documents quickly became available and easy to use. However, a new set of problems reduced their power and effectiveness. With these new tools came incredible creative power, providing designers and artists with the ability to electronically manipulate color data themselves. However, in practice these tools required an unrealistic level of training and expertise due to the inherent complexity of color. So while color seemed within reach, it was in fact still as far away as ever. If high-quality color was to reach the masses, either the user's knowledge about color had to increase or the tools had to incorporate this knowledge.

Device-Dependent Color

=====

Why is color so complex? As discussed before, each color device has a range of colors that it can accurately reproduce. The problem occurs when a color that was specified on one device is reproduced on a different device. This is a common occurrence when working with color on the desktop. A color is selected based upon what it looks like on the screen, such as a deep, rich blue. The color that appears on the printer, however, is much less saturated than the color that was specified on the display. The gamuts of the two devices are different, and no translation has occurred between the two. Color in this case is device dependent-the desired appearance of color depends on its being reproduced on a particular device.

Many of the new software and peripherals that became color-aware were manufactured by different companies. So it was common to have a scanner, display, and printer from three different manufacturers, as well as image manipulation and page layout software from different software vendors. But none of these devices communicated in the same language of color. The tools and power of CEPS were now available to anybody for a fraction of the cost. But the continuity that brought the entire system together, the solution that a CEPS provided, was missing. How could these elements be enabled to work together?

In addition, the users of desktop systems, the graphic artists and designers, lacked the color expertise that prepress experts had accumulated. The tools they used were not equipped with the understanding of how color was delivered to different devices, so they failed to deliver a comprehensive solution. The color expert needed to become an integral part of the system.

The Color Management Wave =====

The color spaces typically used by devices are made up of the additive or subtractive primary colors. The additive colors, red, green, and blue (commonly referred to as RGB), are used by all color displays and many scanners. The subtractive primaries, cyan, magenta, and yellow, with the addition of black (commonly referred to as CMYK or process colors), make up the color space used by output devices, as well as some scanners. The two color spaces also have many areas that do not overlap.

Using color science, Apple developed a methodology to address the problem of device-dependent color. The fundamental solution was to create device-independent color, or colors that are not dependent on any particular device. The idea is to use color spaces that represent the entire range of visible colors as translation spaces. This means that any color that is selected on a display is in the gamut of this neutral color space. In 1931, the CIE (Commission Internationale d'Eclairage) established standards for a series of color spaces that represented the visible spectrum-60 years before the arrival of desktop color!

The CIE color spaces form the foundation of device-independent color for color management. Many of these spaces, such as CIE XYZ and CIE Lab, are widely used in desktop color management systems today. These color spaces, along with several other pieces that will be described in the following sections, together form a system for managing and matching colors.

Device Characterization, Device Calibration, and Gamut Mapping =====

In order to accurately render colors from one device's color space to another, some resource must exist that describes each device's color capabilities. Today's systems use profiles. Profiles are basically dictionaries that contain data on a specific device's color information, including its gamut, colorants, and modes of operation. These profiles are created by color scientists working with highly sensitive measuring devices called spectrophotometers. The resulting measurements are input to a custom software package that uses several complex algorithms, the result of which is a profile. This process, known as device characterization, must be repeated to refine the profile until quality results are generated.

It is important to recognize that a device profile represents that device in its factory condition. In reality, devices of the same type will deviate, resulting in inconsistencies, and may require device calibration. This process is much simpler than device characterization, and should be performed on a regular basis to ensure accuracy.

The profiles are then used by a color transformation engine, or a color matching method (CMM). The CMM translates data from one device's colors to another, via an independent color space. The CMM receives the necessary information from the profiles, so that it can accurately transform a color from one device to another. The result is color that is consistent from device to device. It is not possible to have perfect color matches between devices due to differences in

each device's gamut. For example, many of the deep, saturated blues and greens that appear on a display cannot be reproduced by printers using the CMYK ink set.

In this instance, the CMM must perform gamut mapping, a process by which the next closest reproducible color is selected. Most matching systems offer several gamut-mapping methods, or rendering styles. Because the use of color varies from business graphics to photographic reproduction, the rendering intent of a color must be specified to produce the best possible results.

In the late 1980s, a number of leading color technology companies developed systems for color desktop publishing applications. These were commonly known as color management systems, or CMSs. The first CMSs promised to solve the problem of unmatched colors across desktop color devices. These pioneers took the first steps in creating a solution. However, these systems lacked key features, which resulted in poor acceptance by users.

One of the fundamental problems that prevented widespread adoption of early color management systems was the fact that each was implemented using a different architecture. In order to perform color-matching functions, an application manufacturer would have to select one system and then make specific calls to it. However, because there was no common color management framework for applications to use, each application had to use a unique system, with no compatibility between profiles and no consistency among the results.

Because no single system was widely adopted, all of the systems failed to provide a satisfactory solution. From a user's perspective, there was no guarantee that peripherals and applications would all work together to provide a complete work flow with consistent results. And because each system was proprietary, users couldn't exchange files, like profiles, with users of different systems.

These early CMSs primarily addressed only the prepress market. In fact, they provided high-end tools that were very similar to the CEPS systems, but ran on the desktop. They didn't intend to provide a solution for less experienced users of color, such as graphic artists and designers or business users. So color still required expertise and continued to be difficult to use.

New and Improved ColorSync

=====

To address many of the issues surrounding color use, Apple Computer introduced ColorSync 1.0 in 1993. The goal of ColorSync was to provide a common architecture for color-management systems. ColorSync 1.0 was an important first step toward a solution, but it did not completely meet customer needs in certain key areas. The API lacked the necessary prepress functionality for high-end users. The profile format was structured in such a way that it did not contain enough data for higher quality transformations. These elements resulted in somewhat limited developer adoption. Without widespread application and driver support, there were limited vehicles to use ColorSync 1.0. Based on input from end-users and developers, Apple returned to the drawing board to redesign ColorSync. The result is a greatly refined solution, ColorSync 2.0.

Begin_Table

Differences Between ColorSync 1.0 and 2.0

=====

	ColorSync 1.0	ColorSync 2.0
	-----	-----
Profiles:	ColorSync 1.0	Apple Supplied ColorSync 2.0 or third-party ICC- compatible profiles
PowerPC Native:	Yes*	Yes
Channel Limit:	Up to 4	Up to 8
CMMs:	ColorSync 1.0 Default CMM	ColorSync 2.0 Default CMM and CMMs
third-party		
LaserWriter Driver Support:	None	Apple LaserWriter 8.3

End_Table

* Note: ColorSync 1.0.5 is PowerPC native.

ColorSync 2.0 greatly improves on the three key elements of ColorSync: the ColorSync API, the Apple Default CMM, and ColorSync 2.0 (or ICC-compatible) profiles.

ColorSync 2.0: White Paper (2 of 2) (6/95)

Article Created: 30 June 1995

TOPIC -----

This article contains part 2 of the ColorSync 2.0 White Paper.

DISCUSSION -----

Framework for Color Matching

A very important piece of any color-matching solution is a consistent method for users to gain access to the tools that are necessary to complete a task. ColorSync 2.0 provides an architecture that allows applications and drivers to request color-matching functions. This type of interface is commonly known as an applications programming interface (API). The ColorSync 2.0 API provides a powerful array of functions for color-matching needs. For example, the 2.0 API adds functions for features like device simulation, support for color separations using more than four colors, and PostScript driver support. In conjunction with the ICC profile format, ColorSync 2.0-supporting applications can actually store the color data for the device on which the file was created inside the file. For example, storing a scanner's color data in the file on disk ensures accuracy regardless of the system or platform the file is used on.

The ColorSync 2.0 API thus removes the need for application vendors to call specific APIs for color matching. With the release of ColorSync 2.0, most color management manufacturers will release new versions of their software that work within the ColorSync 2.0 architecture. This means much less work for application vendors—they need only call one API for all color management and matching functions. Now an avenue exists for popular tools to work together to ensure that color is communicated accurately, and consistent with the user's intent, across all applications and devices.

The API is only one piece of the solution, the framework for color matching. It is not capable of actual transformations of color data. The second piece of the system is the transformation engine that actually changes color data. This is

known as a color matching method, or CMM. ColorSync 2.0 contains a default CMM provided by Apple. The default CMM was developed with the help of a leading manufacturer of prepress equipment, with many years of experience with color science. The result is a CMM that not only produces excellent results, but is extremely fast.

The default Apple CMM is a powerful engine capable of handling the most complex color jobs. However, some users may need a different engine. The ColorSync 2.0 architecture is designed not only to allow the use of CMMs from other developers, but to provide a mechanism for cohabitation and cooperation of CMMs. This allows ColorSync to be flexible enough to provide solutions that the default CMM may not offer. This adaptability protects users with existing color management products and those whose needs may change. It also allows VARs and developers to add value by developing new CMMs without having to create new APIs, system calls, and profile formats.

To accurately transform data between two devices, the CMM must have the necessary information about the devices in use. This information is provided by the profiles. ColorSync 2.0 recognizes profiles in conformance with the International Color Consortium (ICC) profile specification. ICC was founded in 1993 to create standards for the use of color on the desktop. Apple led the way for the foundation of this specification by offering the ColorSync profile specification as a starting point. The result was a broad, cross-platform implementation for color management profiles. The benefit for the user is clear: One profile is all that is needed for any color-matching functions on any popular platform. Apple supplies ColorSync 2.0 profiles for Apple's color-capable peripheral devices with ColorSync 2.0, and ColorSync 2.0 and ColorSync 2.0 profiles are ICC compatible.

Working with Color: Before and After ColorSync =====

To better explain the how ColorSync 2.0 works, let's look at an example of what it has been like to work with color before ColorSync 2.0.

Jill, a graphic designer, is hired to create an advertisement for a new product. The ad needs to include a picture of the product, the company logo, and an attractive design. The final piece will be printed on an offset printing press, using high-quality paper and the traditional CMYK inks. Jill begins the process by scanning an image of the product. Jill examines the scanned image on screen, judging and correcting the color of her scan based on what she sees on her screen. And what she sees is misleading because she has not compensated for the differences between her scanner and her display. When Jill feels that the color on screen matches the original, she moves on to the next step, assembling and laying out the page.

Next Jill inserts the color image and the company's logo into the page layout. The company logo uses spot colors from a swatch book, or colors that require special inks or special ink combinations. Often, spot colors are outside the gamut of a conventional process (CMYK) printing device, while they are in gamut for the display. However, Jill feels that the color logo she sees on her screen accurately represents the colors used in the company's logo.

Next, she places some text in front of a color box. Jill selects the color based on screen values that correspond to the colors in the image the company has provided. Again, she has selected the color based on what she saw on her screen, without compensation for the printing press. After Jill assembles the document, she produces a comprehensive, or "comp" print of the document on her desktop printer. The comp allows her to check that all of the elements look as she intended. It also allows the client to examine the document.

As Jill examines the print, she notices that much of the color on the print is different from the colors on her screen. She must now go back several steps to correct the color. She will spend time repeating this process until the color from her desktop printer is what she wants. Because Jill is unable to preview what the color will look like, she is essentially guessing. And she must perform this process for each design comprehensive she produces for her client so that the client sees the most accurate representation possible.

Once the client views the comps, they may want to make several changes to the document, including changes to the colors that Jill has selected. Once a final comp is selected, Jill must prepare the document for the printing press. She will make the painful discovery that the press proof from the printing press does not match her desktop proof. At this point, she has spent many extra hours and dollars trying to match colors between her monitor, desktop printer, and printing press. She has three alternatives. The first is to have a trade shop or service bureau produce color proofs of her document. However, this would cost her a lot of money and reduce the control she has over the design process. Her second alternative is to simply guess how the colors will be reproduced. However, this may result in an unhappy client. Her third and most sensible alternative is to use a system that will automatically compensate for the differences in color between her devices, thus reducing the frustration, time, and money spent trying to get the results she wants. Jill wants to spend her talent and effort on creating the best possible design, not on trying to make colors match.

Let's examine her work flow using ColorSync 2.0:

Jill begins the process by scanning an image of the product, and then examines the scanned image on screen. She judges the color of her scan based on what she sees on her screen, confident that ColorSync 2.0 has compensated for the differences between her scanner and monitor, as well as alerting her to any colors that are out of gamut for her target printing device. She can now move ahead with the color correction process with confidence that the colors she sees on her screen will be very similar to those produced by her desktop printer.

Next Jill inserts the color image and the company's logo into the page layout. She doesn't worry about the spot colors used in the company logo because the logo file has the source device's color data attached to it, in this case, the display of the machine on which the logo was created. This means that ColorSync 2.0 will automatically adjust the colors between the logo file and her display to ensure accurate viewing of the logo.

Jill then places some text in front of a color box. She selects the color based on screen values that correspond to colors in the image the company has

provided. Again, she has selected the color based on what she saw on her screen, but this time she is confident that the color she has selected will reproduce accurately on the printing press. This is because ColorSync 2.0 knows which output device she will be using, and can adjust on-screen colors for that device. Now that the designer has the document assembled, she produces a comp of the document on her desktop printer. Before she prints, she tells ColorSync 2.0 that her current printing device is a desktop printer, such as an ink-jet or dye-sublimation printer, and that she wants her printer to simulate the printing press on which she'll print the final piece.

ColorSync 2.0 automatically maps the colors from her display to her printer, while keeping her intent of simulating a printing press. The result is a comp that very closely matches her display. She can now show her comps to the client with confidence in the color. Once the client has approved a design, Jill prepares the document for the printing press, where thousands of copies will be printed. Because she's using ColorSync 2.0, she easily creates color separations for the printing press. ColorSync 2.0 ensures that her digital proof closely matches her press output. ColorSync 2.0 has saved Jill enormous time, money, and frustration compared with her previous process. She now has more time to focus on design.

In our example, all steps are performed on a single workstation by a single user. However, in creating color documents, it is common for elements of that document to be created by different people, using different applications running on different computers. These factors can significantly affect the color fidelity between steps. However, ColorSync 2.0 is versatile enough to handle any color job, from a business graph in a presentation to the most difficult prepress task.

Developer and User Benefits

=====

ColorSync 2.0 offers a wide array of benefits for different types of users. Depending on the implementation of a particular application making calls to ColorSync 2.0, different levels of functionality and control become available. The result ranges from automatic color matching to high-end prepress functionality.

Business and desktop graphics users don't need to spend valuable time trying to get colors to look right. ColorSync 2.0 eliminates the guesswork involved in using color by putting the color science in the operating system. Colors that are defined on the screen in presentation or spreadsheet programs are automatically adjusted so that the colors from the printer match those on the screen. It is critical to have this type of solution implemented in the operating system so that color fidelity is consistent across all applications. To do otherwise would produce inconsistent, unacceptable results. Only one operating system currently offers this comprehensive solution: MacOS.

Commercial publishing and prepress users require the highest level of accuracy and performance from their tools. High-end users will appreciate the open approach Apple has taken to implementing ColorSync 2.0. Whether they use a drum scanner, a digital camera, or the hi-fi color process, they'll find that ColorSync 2.0 can handle the wide range of data they need.

A Labor-Saving Framework for Developers

=====

The key to the success of any color management system is that it be a complete solution. This requires the widespread adoption of ColorSync 2.0 by the manufacturers of products used in working with color, including application and device manufacturers, the operating system, and other third-party tools. ColorSync 2.0's expansive architecture provides developers with the plumbing needed to access system-level functionality for color management. With one framework for these functions, application vendors need only write one common set of calls, greatly reducing the development workload.

Before ColorSync 2.0, a manufacturer would have to decide which color management system to support, and then develop to that proprietary system. Application developers can now include color management in their applications without the burden of selecting a single system. Because ColorSync 2.0 has an open architecture, products from other companies can easily work with ColorSync. Developers' color management systems and their supporting products, which were previously proprietary, can plug into Apple's architecture to offer additional functionality to supporting products. Minimal work is required to ensure compatibility with ColorSync 2.0 and supporting applications.

To ensure that peripheral manufacturers benefit from a common framework, Apple led the way in developing the ICC standard-profile format. This format offers many benefits to both end-users and developers. Now peripheral manufacturers need only create one ICC-compatible profile for a device, eliminating the need for several profiles for each CMS and platform.

Together, ColorSync 2.0 and ICC-compatible profiles offer the ability to store the data about an element's original color space in the disk file. This ensures that any user who has ColorSync 2.0 installed can accurately reproduce that element, thus eliminating the possibility of a user not having the necessary profile. ColorSync will read this source data, and provide the necessary information to the CMM for proper display or printing. A variety of different tools are available to developers through the ColorSync 2.0 architecture.

An Open Solution

=====

ColorSync 2.0 alone does not provide a color management solution. Together with Apple's developers, ColorSync 2.0 provides a powerful solution for the needs of users working with color. This solution generates consistent, predictable results as color information is scanned, manipulated on the display, and then printed.

This solution levels many of the roadblocks to users of color, making color accessible to those who previously were intimidated by the daunting challenges of working with color.

Users of all Macintosh applications will be able to take advantage of the capabilities ColorSync 2.0 brings to the Macintosh. All in all, ColorSync 2.0

..TIL18021-ColorSync_2-0-White_Paper_2_of_2_6-95.pdf

allows Macintosh to be the computer of choice for anyone who wants to communicate effectively and powerfully with graphics, type, and color.

Powerbook 500 Series: Setting Up An External Modem (6/95)

=====

Article Created: 26 June 1995

TOPIC -----

I have a PowerBook 520 which does not have an internal modem. I cannot figure out how to set it up to use it with an external modem. In the manual it says that I should open the PowerBook Setup control panel and choose the Compatible option. I do not have that choice in my PowerBook Setup control panel. What do I do now?

DISCUSSION -----

In the PowerBook "Getting Started" manual the instructions for installing/using an external modem (pg. 106) indicate that you should open the PowerBook Setup control panel and select Compatible for the Modem Setting.

However, this manual was written under the assumption that you may have an internal modem installed in your PowerBook. Not all PowerBooks have internal modems. The Compatible option will only show up in the PowerBook Setup control panel if your PowerBook has an internal modem installed. If you have no internal modem, you will have no choices for Modem Setting.

The step described in the manual is an extra step required only for PowerBook computers with internal modems. You can skip this step and go on to the next step in the manual.

Power Macintosh 9500: Optimizing PCI card performance (7/96)

Article Created: 27 June 1995
Article Reviewed/Updated: 13 July 1996

TOPIC -----

This article discusses a configuration tip to provide optimal performance in Power Macintosh 9500 computers using more than three PCI cards.

DISCUSSION -----

In the Power Macintosh 9500, there are six PCI slots (A1, B1, C1, D2, E2, F2), which are serviced by two PCI controller chips (Bandit 1 and Bandit 2). Theoretically, each controller chip can handle up to four PCI cards. However, in order to even the data bandwidth load, three PCI slots are distributed to each controller. Specifically, Bandit 1 controls slots A1-C1, and Bandit 2 controls slots D2-F2. This distribution can almost be thought of as two PCI buses with three slots each.

The slots on the logic board are labeled by letter and number. The labelling, which is printed next to the slot, is used only to identify the physical location of the slot on the logic board. Located between the Power Supply and the bottom of the case, the slots look like:

Power Supply

-----	PCI Slot A1
-----	PCI Slot B1
-----	PCI Slot C1
-----	PCI Slot D2
-----	PCI Slot E2
-----	PCI Slot F2

Bottom of Case

Additionally, the I/O circuitry on the logic board, which controls functions such as ADB and Serial I/O, was designed to be accessed through the PCI bus. The I/O circuitry functions as a PCI card built into the logic board. When

considering performance of the PCI bus, it can be assumed that I/O functions will consume some of the bandwidth of the PCI bus. Depending on the amount of I/O activity, the PCI bus handling I/O may run slower than the PCI bus that does not.

On the Power Macintosh 9500, the I/O functions are handled by the first PCI controller (Bandit 1). Because the first PCI controller handles both I/O functionality and slots A1-C1, performance of cards in these slots may be decreased.

In order to achieve optimal performance of PCI cards, slots D2-F2 should be used first. However, when using high-bandwidth cards, which are moving large amounts of data across the PCI bus, it may be beneficial to evenly distribute the cards between the two buses. In such circumstances, it is likely that the I/O bandwidth is much smaller than that of the high-bandwidth card. To distribute data evenly across the entire PCI bus, you may want to use the following order: D2, A1, E2, B1, and so on.

MacTCP and SOCKS Compliance (6/95)

Revised: 6/27/95
Security: Everyone

MacTCP and SOCKS Compliance (6/95)

=====

Article Created: 27 June 1995

TOPIC -----

I need to know what, if any support, MacTCP has for SOCKS, and whether SOCKS support is implemented at the application level, for example Mosaic, Netscape, and so on?

DISCUSSION -----

SOCKS is a public domain Internet socket service consisting of client library routines and a daemon which interact through a simple protocol to provide convenient and secure network connectivity through a firewall host.

SOCKS support would be implemented in the various clients (ftp, telnet, www, and so on), and not directly in the protocol stack (MacTCP) itself. The library functions could be included in the protocol stack but support would still be required in the applications. It is not essential to have the library integrated into the protocol stack to provide SOCKS capabilities. Any client can implement the library routines within the application to allow SOCKS functionality.

The only applications we are aware of that provide support for SOCKS on the Macintosh is Netscape and InterCon Systems Corporation's TCP/Connect II. TCP/Connect II offers a suite of applications (mail, news, ftp, and www).

MAE 2.0: Technical Frequently Asked Questions (6/96)

Article Created: 27 June 1995
Article Reviewed/Updated: 25 June 1996

TOPIC -----

This article is the MAE 2.0 Technical Frequently Asked Questions (FAQ) for users of Macintosh Application Environment (MAE).

DISCUSSION -----

Table Of Contents

- File System
- Networking
- Floppy Disks and CD-ROMs
- Performance
- Keyboard and Display
- Prints and PostScript
- Other

Entire document is new for version 2.0 of MAE.

See Also:

- MAE 2.0 Tech Notes, available on <http://www.mae.apple.com> or via anonymous ftp from <ftp.support.apple.com> in directory /pub/mae/technotes.
- MAE 2.0 README.TXT (on MAE 2.0 product CD-ROM)

File Systems

Question: How do I show files and directories whose names begin with "." in MAE Finder windows?

Answer: You can show/hide these files and directories by setting the appropriate

check box in the Views control panel.

Question: Why are file sizes different in MAE and UNIX?

Answer: Using MAE to copy files from a CD or from network-based volumes can result in source and destination files of different sizes, as viewed by the UNIX file system. This is due to MAE's default of storing files in AppleSingle format. Since MacOS files have both resource and data forks, MAE handles these files differently on a UNIX File system, in a format called "AppleSingle". For more details, refer to "AppleSingle and AppleDouble File Formats" in the MAE 2.0 Tech Notes (see "See Also" following the table of contents of this document).

Question: Why won't my UNIX applications recognize files from MAE applications?

Answer: This is related to the previous question. By default, UNIX files are written by MAE in AppleSingle format. Since UNIX and its applications know nothing about the Macintosh "resource headers" tacked onto the beginning of files in their AppleSingle representation, UNIX applications may see these files as corrupted. For more details, refer to "AppleSingle and AppleDouble File Formats" in the MAE 2.0 Tech Notes.

This "corruption" can occur in a number of different ways. For example, under FileShare, if a UNIX file is dragged from a Macintosh to MAE, the file will be written by MAE in AppleSingle format, which may make it unusable. This occurs because the Macintosh doesn't know anything about UNIX files, so when it sends one to MAE, MAE thinks it's a Macintosh file and writes it to disk accordingly.

This situation does not occur between two MAE sessions that are sharing files, since MAE recognizes UNIX files for what they are and does not store "resource" information about them. When dragging a UNIX file between two MAE sessions, MAE correctly treats the file as a UNIX file.

Using ftp utilities such as Fetch from MAE can also be problematic. When "getting" a file, Fetch will pass the file to MAE to be written to disk. This works fine for Macintosh files since they will be written as AppleSingle files. However, when "getting" a UNIX file, MAE will likewise write this file as an AppleSingle file, which can make it unusable by UNIX applications.

Text files are handled differently by MAE. Text files are always written by MAE in AppleDouble format to facilitate reading and writing by both Macintosh and UNIX applications (newline characters are automatically translated by MAE; they are stored on disk as UNIX newlines). So in the examples above, when dragging a text file from a Macintosh to MAE or when Fetch gets a file using ftp "Text" mode (i.e., ASCII mode), MAE will write the file in AppleDouble format.

NOTE: Fetch 3.0 and higher will not work with MAE 2.0.2, use version 2.x.x.

As a rule of thumb, it's best to use UNIX to work with UNIX files and MAE to work with Macintosh files. If your environment requires the same (non-text) files to be regularly handled by both MAE and UNIX, then you're probably a candidate for running MAE in AppleDouble mode, by launching it with the

-filedouble option.

Question: Can I run UNIX commands located on Macintosh floppy disks?

Answer: MAE does not support execution of UNIX commands from Macintosh floppy disks.

Networking

Question: I like to have the Chooser open and available throughout my MAE session. Does this generate unnecessary network traffic?

Answer: The Chooser generates significant traffic only when it is the foreground application and a Chooser device (such as AppleShare) is selected. It generates minimal traffic when it is the foreground application and no Chooser devices are selected. It generates no traffic when it is in the background. Keeping the Chooser open when using other applications should not generate network traffic or impact network performance.

Question: I just launched MAE. I see the message "Unable to open the file '/dev/appletalk/lap/ethertalk0/control, please be sure the file exists'" in the UNIX window from which I launched MAE. What does this mean?

Answer: AppleTalk is not installed properly. AppleTalk installation must be done as root on each system on which you want to run MAE. You cannot simply copy your MAE binaries from machine to machine. The AppleTalk installation correctly configures your kernel and creates device files used by AppleTalk.

Question: Whenever I use Find File to search a folder exported via FileSharing from a workstation running MAE 2.0, both the client and the server appear to hang. Is this a bug?

Answer: This is a file system problem. FindFile uses PBCatSearch to search the entire volume anytime a search is done. For large volumes with nested mountpoints, PBCatSearch can take a very long time. It is best not to use FindFile to search remote volumes.

Question: I have two ethernet cards installed on my workstation; can I select either card for my MacTCP interface?

Answer: No. The MacTCP driver will use the first interface detected by the ifconfig command. If more than one ethernet card is installed, MacTCP will be configured for the first card.

Question: Can I use the MacTCP control panel to set my MacTCP ip address?

Answer: No. When you run MacTCP on MAE, it uses the host and ip configuration of

the UNIX workstation on which you are running MAE. This control panel is for information only. As a user, you cannot reset your workstation's ip/host information using MacTCP.

Question: We use File Sharing to share files between Macintoshes and workstations running MAE 2.0. We have experienced problems when accessing files exported from an MAE workstation while performing server maintenance chores on that workstation. In particular, changing access permissions or ownership seems to adversely affect clients accessing the file server. Is there any way we can prevent this?

Answer: It is best not to attempt to alter the sharing status of a folder while it is being used by a remote client. If you want to alter the status of a shared folder (by changing its access permissions, changing its owner, or unsharing it) you should check the "File Sharing Monitor" to see that no one is using the folder before changing its sharing status.

Floppy Disks and CD-ROMS

Question: (Sun only) I'm having difficulty mounting CD-ROM discs on Solaris 2.4.

Answer: MAE may be unable to mount CD-ROMs under Solaris 2.4, even though the file macdisk.Solaris is unchanged from Solaris 2.3, where CD-ROMs can be mounted without difficulty.

For mounting CD-ROMs in MAE while running Solaris 2.4, follow these steps:

Step 1

Verify that Volume Manager patch 101907-05 has been loaded.
(/etc/showrev -p will list all installed patches.)

Step 2

Under Solaris 2.4, modify the macdisks.Solaris file in this manner (scsi6 should be replaced with the correct SCSI ID# of the CD-ROM Drive):

```
scsi6:removable:ro:/vol/dev/aliases/cdrom0
```

NOTE: After inserting the CD-ROM, wait 5 seconds before attempting to mount it in MAE. The Volume Manager first must create an entry in aliases for 'cdrom0' before MAE will be able to read the alias directory.

This will properly allow MAE to mount CD-ROMs without modifying the /etc/vold.conf directory, thereby allowing the user to mount UNIX CD-ROMs with the Volume Manager.

Question: Is there any way of accessing a Mac-formatted hard disk from MAE if I connect it to the SCSI bus on my workstation?

Answer: No. MAE does NOT support HFS format hard disks (only CD-ROMs and

floppies). You may potentially damage your workstation or Mac disk if you try to connect the two.

Question: What kinds of removable media are compatible with MAE?

Answer: The current release of MAE only supports Macintosh formatted CD-ROMs and Macintosh formatted 1.4 Meg floppy disks.

Question: Are ISO 9660 format CD-ROMs compatible with MAE?

Answer: No. Do not add the "ISO 9660 File Access" extension (or any of the other Mac CD-ROM extensions) to your System Folder.

If ISO 9660 CD-ROMs are mounted under UNIX (Solaris 2.3 does this automatically), the mounted directory should be accessible to MAE. (It does not appear as an icon on the desktop.)

Performance

Question: Can MAE be run as an X Application over the network?

Answer: Yes. However, MAE was optimized to run as a local application and be displayed on the local workstation console. While MAE is certainly an X application and can be run remotely, it is graphics intensive and may run significantly slower over the network. MAE performance is highly dependent upon the X server, X client, and network bandwidth/traffic.

Question: Can I increase the performance of MAE when using a remote X-Client over the network?

Answer: Yes. Changing the Monitors Control Panel to "Black and White" will reduce the amount data sent over the network to the X-Client. This can make a significant difference when running remotely, especially with graphics intensive applications.

Question: Will performance be affected if my home directory is located on a remote volume?

Answer: Yes. The "System Folder", which contains the MacOS system files, is built in your home directory when you start MAE for the first time. Performance will be affected since the code in this folder must be executed to run MAE and it will run more slowly when the System Folder is located on a remote volume.

Question: Can I run MAE with my home directory physically located on a machine running SunOS 4.1.x and NFS mounted to a Solaris 2.x workstation running MAE?

Answer: Yes, but be careful with your permissions. Performance may also be

significantly affected.

Keyboard and Display

Question: Why does the cursor sometimes disappear from the screen, when I'm using MAE with a black and white monitor?

Answer: The MAE cursor can "disappear" when it enters an area of the MAE screen that is the same color as the cursor. This is most prevalent when running MAE in monochrome mode and you move an all black cursor (for example, the I-beam cursor) over an all black region of the screen. If your X Server supports color cursors, you can control the foreground and background colors of the MAE cursor by setting the TBFGCURSORCOLOR and TBBGCURSORCOLOR environment variables, as in the following c-shell example:

```
setenv TBFGCURSORCOLOR red
setenv TBBGCURSORCOLOR blue
```

Question: When I try to abort an MAE application by pressing Command-Option-Escape, MAE hangs. What's the problem?

Answer: This feature is not implemented in MAE 2.0. Avoid trying to abort applications with Command-Option-Escape on both Sun and HP.

Printers and PostScript

Question: I'm having trouble getting my PostScript printer to print reliably under MAE. What should I do?

Answer: While developing MAE, we couldn't test on all possible PostScript printers - there are just too many. Also, many older PostScript printers have very little memory (for example, the original Apple LaserWriter(tm), only had 1 Mbyte of RAM), making it difficult to print complicated documents on them. A Macintosh computer, by communicating directly with the printer, can circumvent this memory limitation by optimizing the feeding of PostScript to the printer. MAE's LprWriter, however, uses the underlying UNIX print spooler, and does not communicate directly with the printer. It is therefore possible for a printer to be unable to print a complex document from MAE that it can print successfully from a Mac.

Other tips:

1) The LprWriter driver generates Level 1 PostScript, which should print on any "real" PostScript printer that has enough memory. (Some companies didn't license a PostScript interpreter from Adobe but wrote their own; these often have problems.)

2) It is very important to specify the correct PPD file for the printer. The PPD file contains information about resident fonts, memory size, page sizes, etc. An incorrect PPD specification can create many problems.

3) If the PPD file for a printer isn't shipped with MAE, you can try to get it directly from the printer manufacturer, or from Adobe. Adobe, the creator of PostScript, maintains archives of PPD files, and technical papers about PostScript. These are available on the Internet, at Adobe's ftp server, ftp.adobe.com (130.248.1.4). The login is "anonymous" (without the quotes), and you should use your email address as the password. PPD files are in the directory : /pub/adobe/PPD/mac

NOTE: all spaces in PPD filenames have been replaced with tildes (~), to make it easier to retrieve the files. After downloading a PPD from this directory, change all tildes in the filename to spaces.

You can also send mail to their email server:
ps-file-server@adobe.com

Send an email message with just the word "help" in the subject for instructions on how to use the email server.

Other

Question: Why won't my Solaris 2.4 machine successfully run MAE unless it is connected to a network? Without a network, MAE hangs after the "Welcome to Macintosh" screen, and I must kill MAE from a UNIX shell. If the same machine is added to a network, MAE starts up fine.

Answer: Solaris 2.4 workstations not connected to a network require Sun's patch 101945-27 (this "megapatch" is newer than the patches recommended in the MAE 2.0 README). connected to a network. This patch can be found at sunsite.unc.edu. After installing the patch, remove the file /tmp/at if it exists.

Question: Why won't MAE 2.0 produce sound on my HP Workstation?

Answer: See ISSUES RELATED TO SOUND in the README file delivered with MAE 2.0. Final check: be sure the AUDIO environment variable is set to the target audio server.

Question: Using Aldus Persuasion 3.0 with MAE, I can open documents, but can't save them. What's the problem?

Answer: You will have to save your Persuasion 3.0 documents under a name different from their original name. This workaround is necessitated by an incompatibility between MAE and Persuasion 3.0 that causes Persuasion to think the original document is locked; it therefore opens a copy, with a generic 'untitled' name. Because it thinks the original document is locked, you can't save the modifications under the original name.

This article is one of many available through the Apple Fax center. For a complete list of available Fax documents, search the Tech Info Library for Apple

Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

QuickTake 150: Developers Can Contact APDA (6/95)

Revised: 6/27/95
Security: Everyone

QuickTake 150: Developers Can Contact APDA (6/95)

=====

Article Created: 27 June 1995

TOPIC -----

A developer is requesting information in order to write an interface to use the QuickTake 150 on a computer that is not compatible with Mac OS or Windows.

DISCUSSION -----

Apple Computer supports the QuickTake cameras on two platforms, Macintosh and Windows. If a developer wants to support platforms other than these, there is technical documentation available from the Apple Programmers and Developers Association (APDA) called the QuickTake Software Developers Kit.

It would also be possible to download images from a QuickTake camera into either a Windows or Macintosh computer, and then transfer the files to another platform in a image file format that is compatible with that machine.

Search the Technical Information Library (TIL) for "APDA" in order to locate contact information.

AudioVision 14 Display: System 7.5 Compatibility (7/96)

Revised: 7/19/96
Security: Everyone

AudioVision 14 Display: System 7.5 Compatibility (7/96)

=====
Article Created: 27 June 1995
Article Reviewed/Updated: 19 July 1996

TOPIC -----

Are there any known issues with the AudioVision Display Software 1.0.2 and System 7.5?

DISCUSSION -----

The AudioVision Display Software was not fully tested using System 7.5, so there were some software related issues. Instead of using the AudioVision Display software, you should upgrade to the AppleVision software v1.0.2 or later which addresses all of the AudioVision issues. The AppleVision software is available on Apple Software Update sites.

Macintosh Performa 640 DOS Compatible: Specifications (4/97)

Revised: 4/29/97
Security: Everyone

Macintosh Performa 640 DOS Compatible: Specifications (4/97)

Article Created: 27 June 1995
Article Reviewed/Updated: 29 April 1997

TOPIC -----

This article provides the specifications of the Macintosh Performa 640CD DOS Compatible computer.

DISCUSSION -----

Common Features

=====

Integration

- Run Mac OS and DOS or Windows software simultaneously
 - applications, games and CD-ROM titles
- Toggle between operating systems with a keystroke
 - single monitor supports both
- Copy & paste between OS environments
- Easily share files and folders
- Use Mac compatible printer and peripherals with both operating systems
- Supports Apple monitors (High Resolution RGB up to Multiple Scan 15) or VGA and SVGA monitors

Storage

- 1.4 MB Apple SuperDrive floppy
 - Read and write Mac OS, MS-DOS, OS/2 and ProDOS disks
- 500 MB IDE hard drive, 1/3 height
 - PC files reside in virtual drive container
- Double-speed CD-ROM drive

Options

- CommSlot Ethernet card
 - 10 BASE-T, thin, thick, AAUI

- Apple Presentation System

Bundled Hardware

- Apple Multiple Scan 15 Display
- AppleDesign Keyboard
- Global Village TelePort Gold 14.4Kps Fax Modem

Environment

- Operating Temperature
 - 50° F to 104° F (10° C to 40° C)
- Storage Temperature
 - -40° F to 116.6° F (-40° C to 47° C)
- Relative Humidity
 - Operating: 10% RH to 90% noncondensing
 - Non-operating: 5% RH to 95% noncondensing
- Altitude
 - Operating: -1,000 to 10,000 feet
 - Non-operating: -1,000 to 40,000 feet

Weight

- 19 Pounds (8.6 Kg)

Dimensions

- 12.6" X 16.5" X 4.3" (320 mm X 419 mm X 109 mm)

Electrical Requirements

- Line voltage: 100-240 volts AC, RMS, single-phase, nominal
- Frequency: 50-60 hertz (Hz)
- Power consumption: 45 watts maximum, not including monitor

ADB Power Requirements

- Maximum current draw for all ADB devices is 500 milliamperes (mA) (a maximum of three Apple Desktop Bus devices is recommended)
- Mouse draws up to 10 mA
- Keyboard draws 25-80 mA (varies with model).

Other

- Front headphone jack
- Front controls for volume
- Infrared remote control
- Power on/off from keyboard

Macintosh Features

=====

Processor & RAM

- 68LC040 running at 66/33 MHz
- 8 MB RAM standard
 - 4 MB on logic board, 4 MB in SIMM
 - Expandable up to 52 MB (32 MB in one SIMM, 16 MB in other)
 - Two 72-pin SIMM sockets
 - Expand single SIMM at a time
 - 80 ns or faster
- 1 MB ROM

Expansion & Ports

-
- Video-in slot (Optional)
 - TV tuner slot (Optional)
 - Communications slot
 - SCSI, two serial, ADB, sound-in, sound-out
 - Internal LC-Compatible 68030 processor-direct slot (PDS) with installed DOS-Compatibility Card*

Video

-
- 1 MB DRAM video frame buffer
 - 16-bit color at 640x480, 8-bit color at 800x600, 832x624
 - Supports video in a window with optional card

Sound

-
- 8-bit monophonic sound input
 - 8-bit stereophonic sound output (16-bit CD stereophonic playback)
 - Sound input port for optional microphone or line input
 - Two sound output ports, level nominally 0.5 volts RMS into 39 ohms
 - Internal speaker, muted whenever a plug is inserted into either sound output port

Software

=====

System software

-
- Mac OS System 7.5.1 with Apple Guide, AppleScript, PC Exchange
 - At Ease

Third-party software bundles

-
- American Heritage Dictionary
 - ClarisWorks
 - Quicken
 - MacLink Plus/Easy Open Translators
 - Click Art Performa Collection
 - MacGallery Clip Art Treasure Pak
 - Espresso
 - Zip Zap
 - TelePort Gold II for Performa
 - TelePort Modem Legend Tour

CD bundles

- TIME Almanac Reference Edition
- CardShop/StickerShop Plus
- 3D Atlas
- 1995 Grolier's MM Encyclopedia
- Club KidSoft

DOS/Windows Features

=====

Processor & RAM

- 486 DX/2 running at 66 MHz
- 4 MB RAM standard on SIMM
 - Expand up to 32 MB
 - One 72-pin SIMM socket
 - 80 ns or faster
- DMA for shared-memory support provided through Mac OS system software

Networking

- Included ODI driver supports Novell NetWare IPX and TCP/IP protocols

Sound

- SoundBlaster 16 compatible audio out

Ports

- Joystick (DB-15)
- Serial ports emulate PC serial interface (COM1, COM2)
- Printer port emulates parallel port (LPT1) supporting PostScript, Epson and HP PCL-style printer drivers

Video

- 512K DRAM video frame buffer
- 8-bit color at 640x480
 - 4-bit color at 800x600
- Supports VGA, SVGA, EGA, CGA standards

Software

- DOS 6.22 and Windows 3.1 included
- SoundBlaster

*Note: The Macintosh Performa 640CD DOS Compatible computer is not upgradeable to a PowerPC processor. The DOS Compatibility Card is installed in the single PDS slot.

Video Capture: Bottom Part Of Screen Out Of Sync (6/95)

Revised: 6/27/95
Security: Everyone

Video Capture: Bottom Part Of Screen Out Of Sync (6/95)

=====

Article Created: 27 June 1995

TOPIC -----

I have a Macintosh Performa 636/CD with Apple's Video In card installed. The Video In card was part of the Apple TV/Video System I purchased. When my computer is in video capture mode the bottom 1/8 inch of the screen seems out of sync. What could be causing this to occur?

DISCUSSION -----

The problem you are seeing will be exhibited on any computer using any video in card. The problem is actually generated by the video camera recorder itself and captured on the resulting video tape.

The "tearing" of the picture at the bottom of the screen is a result of the technology used in consumer grade video camera recorders and video cassette decks. The tearing (missing line) is not usually visible on a television screen because the television overscans the picture which covers for the flaw.

Color LaserWriter 12/600 PS: Pantone Software (7/95)

Revised: 7/27/95
Security: Everyone

Color LaserWriter 12/600 PS: Pantone Software (7/95)

Article Created: 27 June 1995
Article Reviewed/Updated: 27 July 1995

TOPIC -----

The Color LaserWriter 12/600 PS includes a card referring to Pantone calibration software. What is this software, and where is it available?

DISCUSSION -----

The PANTONE software basically consists of PANTONE color palettes that have been "tuned" for the Color LaserWriter 12/600 PS. The palettes have been created in application-specific file formats for the most popular desktop publishing applications that use the PANTONE color matching system. Loading these color palettes into the specified applications allows you to closely match screen colors to output colors on the Color LaserWriter 12/600 PS.

The PANTONE files for the Color LaserWriter 12/600 PS are available on online services.

These articles can help you locate the software update mentioned here:

At Ease for Workgroups 3.0: Mounted Volumes (8/95)

Revised: 8/14/95
Security: Everyone

At Ease for Workgroups 3.0: Mounted Volumes (8/95)

=====

Article Created: 27 June 1995
Article Reviewed/Updated: 14 August 1995

TOPIC -----

This article describes a security issue in At Ease for Workgroups 2.0.3 that was fixed in At Ease for Workgroups 3.0.

DISCUSSION -----

If the At Ease disk, in At Ease for Workgroups 2.0.3, is a mounted volume and a User's privileges are Go To Finder, the user will find the mounted volume on the desktop when they are in the Finder.

In At Ease for Workgroups 3.0, a mounted volume is dismounted when a user executes the Go To Finder command. The volume will have to be re-mounted after they are in the Finder.

Connection Kit for Macintosh 2.0: Create Import Template (6/95)

Revised: 6/27/95
Security: Everyone

Connection Kit for Macintosh 2.0: Create Import Template (6/95)

Article Created: 27 June 1995

TOPIC -----

How do I create a template to import data from another Macintosh application in the Connection Kit for Macintosh 2.0?

DISCUSSION -----

Template creation should follow these general steps:

Step 1

Export the data from the Macintosh application in a delimited ASCII (text) format file. The field delimiting character can be a TAB or any ASCII character, and the record delimiting character can be a Carriage Return or any ASCII character.

Step 2

Open the text file in a word processor to view the sequence of the exported data. Note the sequence of the fields and the ASCII character that separates the fields and the records.

Step 3

Create the template in the Connection Kit matching the EXACT sequence of the fields in the exported data. Follow the steps on pages 6 through 9 in the Newton Connection 2.0 Update addendum on how to create a template. Note the sequence of the fields you Add to the right hand window of the Template window, it must match exactly the sequence of the exported data.

Step 4

Once the template is created, import the text file and verify the data is placed in the correct fields in the Connection Kit. If the data is not placed in the correct field(s), the template will need to be edited to match the sequence of the delimited ASCII text file.

Specific template field information follows for the applications within the Connection Kit.

Names Template Fields

Ms./Mr.
First Name
Last Name
Title
Company
Address
Address2
City
State
Zip Code
Country
E-Mail
Phone1
PhoneKey1
Phone2
PhoneKey2
Phone3
PhoneKey3
Phone4
PhoneKey4
Birthday
Folder
List By
Card Style
Notes

Names template fields defined:

PhoneKey - Description of Phone fields (choices are Home, Work, Fax, Car, Beeper, Mobile and other) Any other information in this field will be ignored when imported into the MessagePad.

Folder - The folder name where you would like the data to reside once the data is on the MessagePad. The folder name must match exactly the folder name on the MessagePad. For instance, if you have a folder name of "Personal" in this field and you have a folder name of "Personal" on the MessagePad, the Name card will be placed in this folder. If you do not have a "Personal" folder on the MessagePad, the note will be placed in the "Unfiled" folder.

List By - How the Name cards will be listed in the MessagePad. List By will be either Last Name or Company. Any other information in this field will be ignored when brought over to the MessagePad.

Card Style - There are 4 card styles for the Apple MessagePad. These styles are Style1, Style2, Style3 and Style4. Any other information in this field will be ignored when brought over to the MessagePad.

Notes - These are text notes attached to the Name cards.

Names Example:

Mr. (TAB) John (TAB) Doe (TAB) Apple Computer, Inc. (TAB) 1200 West Orion (TAB)
Anytown (TAB) Texas (TAB) 78456 (TAB) 213-555-9999 (carriage return)

Notes Template Fields

Created

Text

Folder

Notes template fields defined:

Created - The creation date of the Note.

Text - The text of the Note.

Folder - The folder name where you would like the data to reside once the data is on the MessagePad. The folder name must match exactly the Folder name on the MessagePad.

Notes Example:

5/24/95 (TAB) Buy groceries before lunch (TAB) Personal Folder

Dates

All Dates data to be imported MUST have a Type of "Meeting", "Day Note", or "To Do Item". The data will not be imported if the text of the Type does not match exactly. Note that importing Repeating Meetings into the Connection Kit is not supported. Repeating Meetings can only be exported from the Connection Kit.

Meeting Template Fields

Type

Title

Date

Start Time

Duration (minutes)

Notes

Meeting template fields defined:

Type - Type will always be Meeting.

Title - The title of the Meeting.

Date - The date the meeting is on.

Start Time - The time the meeting starts in Military Time format.

Duration - Length of the meeting in minutes.

Notes - Any notes attached to the Meeting Slip.

Meeting Example:

Meeting (TAB) Lunch (TAB) 5/24/95 (TAB) 12:00:00 (TAB) 60 (TAB) Discuss business
(Carriage Return)

Day Note Template Fields

Type

Title

Date

Notes

Day Note template fields defined:

Type - Type will always be Day Note.

Title - The title of the Day Note.

Date - The date the Day Note is on.

Notes - Any notes attached to the Meeting Slip.

Day Note Example:

Day Note (TAB) Vacation (TAB) 5/24/95 (TAB) Trip to the beach (Carriage Return)

To Do Item Template Fields

Type

Title

Date

Priority

Done

To Do Item template fields defined:

Type - Type will always be To Do Item.

Title - The title of the To Do Item.

Date - The date the To Do Item is on.

Priority - The priority of the To Do Item; either 1, 2, or 3

Done - Whether or not the To Do Item is completed or not. Completed = True, Not
completed = False

To Do Item Example:

To Do Item (TAB) Buy Groceries (TAB) 5/24/95 (TAB) 2 (TAB) False (Carriage
Return)

Connection Kit for Macintosh 2.0:Export Application Data (6/95)

Revised: 6/27/95
Security: Everyone

Connection Kit for Macintosh 2.0:Export Application Data (6/95)

=====

Article Created: 27 June 1995

TOPIC -----

I would like to download data from a Macintosh database to my MessagePad. The Connection Kit for Macintosh 2.0 does not have a built-in translator for my application. I understand I need to export the application data in a delimited ASCII (text) file, but I'm unsure how to do this.

DISCUSSION -----

The data export process will vary from application to application. In general terms, you can follow the guidelines below to export your data in an delimited text file. For specific information on how to export data from an application, always consult the manual or contact the developer of the application for information. After the data is exported, you will need to import it into a Newton Connection Kit template you create.

Overview

Database information can be defined in general terms by Fields and Records. Groups of fields often compose a single record. A business card can be used to visualize fields and records. The individual pieces of information on the business card such as First Name, Last Name, Company, Address, City, State, Phone Number can be viewed as fields. The entire business card with all of the information on it can be viewed as a record. A group of business cards in a rolodex can be viewed as multiple records in a database.

Export Process

To begin the export process, choose the command to export data in the database or contact manager. In most cases, you will then need to choose the export file type. A Tab or Comma Separated ASCII Text format will work well with the Connection Kit. The Tab or Comma character is used to separate the data fields and is known as a delimiter. Any other ASCII character can also be used as a delimiter to separate the data into distinct fields.

After selecting the export format file type, the application may ask you to select the data fields to export and to indicate an export order, or it may just export the data in the order it is currently in. Applications will vary on the amount of control you have to export the data. Again, for specific information on how to export data from an application, always consult the manual or contact the developer of the application for information.

In general terms, what happens next is the application goes to the first record in the database, takes all information in the first field (for example First Name) and copies it to the text file. The application then enters a delimiter into the text document, goes back to the first record, copies the data in the second field (for example Last Name), and places this data back into the text file AFTER the delimiter. This cycle repeats itself until all of the field data in the first record is placed in the text file. After the first record has been exported, many applications will place a carriage return between it and all subsequent records until all records are exported. Any other ASCII character can also be used as a delimiter to separate the data into distinct records.

Export Example:

An example of how a contact database with the fields first name, last name, address, city, state, zip and phone number would look after exported in a tab delimited text (tab separated) format.

Record 1:

John (tab) Doe (tab) 1200 West Orion (tab) Anytown (tab) Texas (tab) 78456 (tab)
213-555-9999 (carriage return)

Record 2:

Joanne (tab) Doe (tab) 1200 East Big Dipper (tab) Some-town (tab) Texas (tab)
78346 (tab) 213-555-1212 (carriage return)

Once the data has been exported into the delimited text file, the file is ready to be imported into the Connection Kit via a template you create.

For information on how to create a template in the Connection Kit, see the following TIL article: "Connection Kit for Macintosh 2.0: Create Import Template"

Macintosh LC 630: Screen Control Panel and Beeping (6/95)

Revised: 6/28/95
Security: Everyone

Macintosh LC 630: Screen Control Panel and Beeping (6/95)

Article Created: 27 June 1995

TOPIC -----

What could cause a Macintosh LC 630 computer to beep when trying to wake up after the After Dark Screen Saver has come on?

DISCUSSION -----

System 7.5 and later versions of System 7.1 that shipped with the all-in-one 500 series Macintosh computers include a control panel called Screen. The Screen control panel is designed primarily for use on all-in-one style Macintosh computers, such as the Macintosh Performa and LC 500 series.

Included systems are:

Macintosh Performa 550, 560
Macintosh Performa 575 series
Macintosh LC 520
Macintosh LC 550
Macintosh LC 575
Macintosh LC 580

You can set the Screen control panel to automatically dim the screen after a certain amount of time. After the selected period of time has passed without mouse movement or keyboard input, this control panel will dim the screen and "put the system to sleep." Upon moving the mouse or pressing a key on the keyboard, the image will come back up but you will not be able to click the mouse or type until the beeping stops, usually about ten seconds.

The Screen control panel will also load and allow you to turn it on but will not dim the external monitor on these systems:

Macintosh LC 630
Macintosh Quadra 630

Macintosh Performa 630 series

Macintosh Performa 640 series

In this case, the Screen control panel tries to put the machine to sleep, but the external monitor still displays the image. When you move the mouse or press a key on the keyboard, the control panel senses your input and starts beeping as if it is working normally.

You are seeing After Dark running and when you move the mouse you, are hearing the Screen control panel "wake up" your Macintosh. Since the Screen control panel is not working as intended you should turn it off or drag it out of your System Folder.

Japanese Language Kit: Freezes at Shutdown (4/97)

=====

Article Created: 27 June 1995
Article Reviewed/Updated: 28 April 1997

TOPIC -----

I did a clean install of System 7.5 (International). Then I installed the Japanese Language Kit. It works ok with the Japanese script, but when I shut down or restart, it locks up.

DISCUSSION -----

This problem is fixed in System 7.5 Update 1.0, which can be found in the CD Extras folder on the JLK 1.2 CD, or Apple SW Updates on CompuServe and Apple's internet servers.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.
- "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

PC Net Exchange: Read Me File (6/95)

Revised: 6/27/95
Security: Everyone

PC Net Exchange: Read Me File (6/95)

=====

Article Created: 27 June 1995

TOPIC -----

This article contains the ReadMe file for PC Net Exchange software.

DISCUSSION -----

PC Net Exchange 1.0.1

PC Net Exchange is a utility program that helps users of Mac OS computers share DOS/Windows files, over an AppleTalk network, with users of AppleShare Client for Windows software. This document describes PC Net Exchange and how it works with AppleShare Client for Windows and PC Exchange. PC Net Exchange is distributed free of charge—see the notice at the end of this document for details. For information about purchasing AppleShare Client for Windows and PC Exchange, see your authorized Apple dealer.

Note: None of the products described in this document translates or converts DOS/Windows data files into Macintosh data files, or Macintosh data files into DOS/Windows data files.

AppleShare Client for Windows

The AppleShare Client for Windows software provides file services and print services for Windows computer users on an AppleTalk network. The file services let you share files from your Windows computer with Mac OS computer users on the network. You can use AppleShare Client for Windows to create, copy, use, and delete files on a Mac OS-based computer that is running either AppleShare or Macintosh file sharing.

PC Exchange

The PC Exchange utility lets you use PC-formatted floppy and SCSI disks on a Macintosh computer just as you would use Macintosh-formatted disks. PC Exchange automatically identifies PC disks and files with "PC" icons, and you can save, delete, copy, and open files as usual. PC Exchange internally labels these files as text files, and you can open these files from within any Mac OS-based application that supports text files. (If they are indeed text files, you will be able to use them from within the application you opened. If they are not text files, then the Mac OS-based application will open the files but will not be able to display the contents of the files properly.)

You use PC files other than text files with your Mac OS applications by using the PC Exchange control panel to map PC filename suffixes to Mac OS application document types. (A PC filename suffix is the three characters following the "dot" in a DOS/Windows filename.) Once you have mapped a PC filename suffix to a document type, the Mac OS treats any PC file whose name ends with this suffix as a Mac OS document of that type. You see the file in the Finder represented by the appropriate Mac OS document icon. You can open the document directly from the Finder, automatically starting the appropriate Mac OS application. If the file's format is the type you specified in the mapping process, you will be able to use the file just as if it had been created by the Mac OS-based application.

PC Net Exchange

You can install PC Net Exchange with PC Exchange on your Mac OS servers to extend this suffix-based file-mapping capability to your network. If PC Net Exchange is installed, you can map such files on the Mac OS-based system to Mac OS documents in the same way that you map PC files on locally attached PC disks. Any mapping that you've previously defined is automatically implemented.

If PC Net Exchange is installed on a server, files that users have copied or saved to that server by using AppleShare Client for Windows appear as "PC" (text) files, and you can map these files to Mac OS application document types with the PC Exchange control panel. If PC Exchange is not installed, such files appear on the server as "PC" (text) files, but you cannot map these files to Mac OS document types.

System Requirements

Windows system

- AppleShare Client for Windows version 1.0 or later

Mac OS system

- Macintosh system software version 7.1 or later
- Macintosh PC Exchange 2.0.3 or later

Installing PC Net Exchange

To install PC Net Exchange on your Mac OS system:

1. Drag the PC Net Exchange icon into the Extensions folder inside your System Folder.

2. Restart your computer.

Known Limitations

Some DOS/Windows applications store changes to a document in a temporary file, then rename that file to the original document name when the user saves the document. PC Net Exchange cannot detect this type of file activity, and therefore cannot assign the correct icon to the file. To allow PC Net exchange to assign the "PC" icon to such a file, drag the file into another folder, then back to its original location, or copy the file from the Windows computer to the Mac OS computer using the Windows File Manager.

NOTICE: This document and the software described in it are copyrighted. PC Net Exchange 1.0.1 is released by Apple Computer, Inc., as "freeware." That is, you may use the software free of charge, but Apple makes no warranty or representation, either expressed or implied, with respect to the software, its quality, performance, merchantability, or fitness for a particular purpose. As a result, this software is distributed "as is," and you, the user, are assuming the entire risk as to its quality and performance. Apple provides no support of any kind for this software. You may distribute PC Net Exchange and this Read Me file to others on the condition that you distribute both together and at no charge. The same proprietary and copyright notices must be affixed to any permitted copies as were affixed to the original. Under the law, copying includes translating into another language or format.

DOS Compatibility Card: Using PhotoCDs in DOS (8/95)

Revised: 5/7/96
Security: Everyone

DOS Compatibility Card: Using PhotoCDs in DOS (8/95)

Article Created: 28 June 1995
Article Reviewed/Updated: 22 August 1995

TOPIC -----

I cannot get a PhotoCD to mount using MS-DOS or Windows. My Window CD-ROM discs work properly. How can I use PhotoCD discs with my DOS Compatibility Card?

DISCUSSION -----

There is no way to use a PhotoCD disc in the MS-DOS/Windows environment on the DOS Compatibility Card. However, Apple includes the drivers necessary for the Macintosh to read Photo CD discs, so you can read the disc using the Macintosh environment. Here is a workaround for this problem.

Workaround

It is possible to save the Photo CD files in a TIFF format with various graphic applications such as Adobe PhotoShop or Storm PhotoFlash on the Macintosh. Once the photos are converted, you can share the files on your hard disk drive with Windows.

Article Change History:

Security: Everyone

System Software: Version Matrix, System 6.0.x to 7.0.1 (9/96)

=====

Article Created: 28 June 1995
Article Reviewed/Updated: 9 September 1996

TOPIC -----

This article lists all Macintosh computers that can run system software previous to System 7.1.

For information on System software after 7.0.1, search the TIL using search string "system and enabler and matrix" to locate "System Software: 7.1 and Later Enabler Matrix"

DISCUSSION -----

Use the following chart to determine which version of system software you should be using on your Macintosh computer:

KEY:

! - Not supported

OK - Works with this version of system software

Macintosh	7.0.1	7.0	6.0.8	6.0.7	6.0.5	6.0.4	6.0.3	6.0.2
-----	----	----	----	----	----	----	----	----
128K*	!	!	!	!	!	!	!	!
512K*	!	!	!	!	!	!	!	!

LW Pro 810: Printer Utility Cannot Configure IP Address (6/95)

=====

Article Created: 28 June 1995

TOPIC -----

I'm trying to set the IP address of my LaserWriter Pro 810 with the Apple Printer Utility. My LaserWriter 16/600 PS works fine, but I can't get the same dialogs to come up.

DISCUSSION -----

The Apple Printer Utility does not support the LaserWriter Pro 810, although the LaserWriter Pro 810 has enough common characteristics for some information to be retrieved. You should refer to the LaserWriter Pro 810 documentation to configure its various features.

You can also search the Tech Info Library for more information, use the search string, "Pro 810 and TCP/IP".

Apple Telecom 2.0 and Earlier: PCI Bus Power Mac Issue (5/96).

Revised: 5/23/96
Security: Everyone

Apple Telecom 2.0 and Earlier: PCI Bus Power Mac Issue (5/96).

=====

Article Created: 28 June 1995
Article Reviewed/Updated: 23 May 1996

TOPIC -----

This article discusses compatibility issue between PCI bus Macintosh computers (like the Power Macintosh 9500) and Apple Telecom software.

DISCUSSION -----

Power Macintosh computers that ship with the PCI bus are not compatible with Apple Telecom 2.0 or earlier versions when used with a GeoPort Telecom Adapter. Users should upgrade to Apple Telecom 2.1 or later software.

If you are using a GeoPort Telecom Adapter on these Power Macintosh models, you must disable LocalTalk. To do this, disconnect any LocalTalk devices attached to the printer port (serial devices can remain attached).

GeoPort 2.1 Telecom Adapter ReadMe (5/96)

Revised: 5/27/96
Security: Everyone

GeoPort 2.1 Telecom Adapter ReadMe (5/96)

Article Created: 28 June 1995
Article Reviewed/Updated: 26 May 1996

TOPIC -----

This article is the GeoPort Telecom Adapter 2.1 Read Me file.

DISCUSSION -----

Software Included in the GeoPort Telecom Adapter Kit

Apple Telecom Software 2.1

This includes all software necessary to use the GeoPort Telecom Adapter with the following Macintosh systems:

- Centris 660AV, Quadra 660AV and Quadra 840AV.
- Power Macintosh 6100 series, 7100 series, 8100 series, and 9500 series.

The Apple Telecom User's Guide contains complete information about installing and using this software. An electronic Apple Telecom Upgrade Manual is included in the Telecom Documents folder so that you can learn about the new features if you upgraded electronically and don't have the Apple Telecom User's Guide. Disks 1 and 2 can also be used to install Apple Telecom 2.1 software on Macintosh systems equipped with an Express Modem card.

NOTE: For Power Macintosh 9500 series, version 2.1 or higher of Apple Telecom Software is required. If you are using a GeoPort Telecom Adapter on these Power Macintosh models, you must disable LocalTalk. To do this, disconnect any devices attached to the printer port (except serial printers, which can remain attached).

IMPORTANT: If you select "Sleep" from the Special Menu available on some Power Macintosh models while there is an active GeoPort connection, the GeoPort

Telecom Adapter will automatically disconnect the call without warning.

MegaPhone

This is a basic screen-based telephone application that delivers support of the telephony capabilities of the Apple Telecom 2.x software, including support for dialing from a graphical keypad, copying and pasting telephone numbers, and dragging and dropping business card information.

The full-featured version of MegaPhone is included in the GeoPort Telecom Adapter Kit, which can be purchased separately. The Kit also includes the GeoPort Telecom Adapter, Apple Telecom 2.x software, and SITcomm SE/GTA, which is a terminal emulator application.

Upgrading From Previous Releases of GeoPort Telecom Adapter Software

=====

If you are installing this version of the software over an older version, you should use the Easy Install option rather than the Custom Install option. This ensures that all files are updated as necessary.

NOTE: If you have installed any customized fax cover pages and renamed the fax folder (called Express Fax in previous versions), the Installer moves them to the new Fax Folder. You can still use them, but if you want to keep them in a different folder, you'll need to drag them there manually.

When you have installed over an older version, the folders "Modem Documents" and "Express Fax" and the file "GeoPort ReadMe" may still be left on your hard disk from the earlier version. These are not necessary for using the newer version; you may delete them.

Connection (CCL) Scripts for Apple Remote Access

Use the following connection scripts with Apple Remote Access:

ARA 1.0: GeoPort Telecom ARA 1.x (in Extensions folder in System Folder)
ARA 2.0: GeoPort Telecom ARA 2.x (in Extensions folder in System Folder)

These files are placed directly in the Extensions folder by the Installer program. You do not need to move or copy them there as stated in Appendix C of the Apple Telecom User's Guide. Apple Remote Access 1.0 does not support Power Macintosh computers. You can order an upgrade for Apple Remote Access by calling the Apple Order Center.

Two additional, optional connection (CCL) files, named GeoPort Telecom ARA 1.x/CNG and GeoPort Telecom ARA 2.x/CNG, are installed as well. When you use them, the GeoPort Telecom Adapter transmits data calling tones after dialing. Data calling tones allow the remote machine to detect automatically that an incoming call is a data modem call. If you are dialing into a system that supports data, fax and voice calls (such as another GeoPort Telecom Adapter), you should select it in the Apple Remote Access Setup control panel.

NOTE: The GeoPort Telecom ARA 1.x/CNG and GeoPort Telecom ARA 2.x/CNG files are installed in the Telecom Documents folder. Should you decide to use these optional files, you'll need to drag or copy them to the Extensions folder.

Using Remote Access Dial Back

If your Remote Access server uses a "Dial Back" feature, the server's return call back to your machine may be inadvertently directed to an open telephone application. To avoid this situation, either close these applications or open the Express Modem control panel and choose "Data" as the default call type when you expect an incoming call from another computer.

Using Fax Sender GX With QuickDraw GX 1.1

=====

The Fax Sender GX extension described in Chapter 8 of the Apple Telecom User's Guide can only be used with QuickDraw GX 1.1 or later. Depending on your location, QuickDraw GX 1.1 may not be available in your area at the time this software is released.

If you need to send complex grayscale images, you should use Fax Sender GX instead of Fax Sender. The image quality is superior.

NOTE: The Control-shift shortcut used to select Fax Sender without going through the Chooser is not available when using Fax Sender GX. However, you can create a desktop printer icon for Fax Sender GX and use drag-and-drop to accomplish the same thing.

Fax Sender GX initially defaults to Standard quality. If you plan to use a desktop printer and want to change the default to Fine quality, print a document from any GX-aware application (SimpleText, for example) and select Fine quality from the Fax Sender GX print dialog.

Please refer to the About Fax Sender GX electronic manual installed in the Telecom Documents folder or Chapter 8 of the Apple Telecom User's Guide for more information about this software.

Sharing Fax Sender GX on an AppleTalk Network

Using Fax Sender GX, you can set up one machine on an AppleTalk network to be a central server for sending faxes. Other users on the network can send faxes without having the modem hardware installed in their computers.

In order to do this, the server must have the appropriate hardware installed, and both the server and client machines must have QuickDraw GX (version 1.1 or later) and the fax software installed. To install the fax software on a client machine, select the "Fax Sender GX Client Software" Custom Install option in the Apple Telecom Installer.

Note: If you are sharing your Express Modem or GeoPort Telecom Adapter on an AppleTalk network, try to minimize the time you spend in Fax preview. While you are previewing, other Fax Sender GX users may be paused.

Using the Apple Fax Gateway with PowerTalk 1.1

The Apple Fax Gateway extension should be used with PowerTalk 1.1 or later. PowerTalk 1.1 is included in the System 7.5 system software release.

Note: Apple Fax Gateway only sends AppleMail-compatible letters, text-only files, and PICT files. If you enclose a formatted document (for example, a word processor document), it will be skipped and not be included in the fax.

See also: The About Apple Fax Gateway electronic manual installed in the Telecom Documents folder.

FastPrint

The Fax Viewer program included with this package implements a new FastPrint feature. The speed of printing can be significantly improved but is only available if the preferred memory size setting of the Fax Viewer application is set to at least 1500K (the default is 290K). To enable FastPrint, select the FastPrint checkbox in the Fax Viewer print dialog box. Note that this feature only works with PostScript printers.

Troubleshooting

=====

Connecting to Online Services That Do Not Support Data Compression or Error Correction

First check to see if your software uses a "modem initialization string". If so, locate and remove "S48=0", if it appears in the string. If this does not work or it is not present, add "%C0S46=136" to the end of your modem initialization string (this disables compression). If this still does not work, try adding "&Q0" instead (this disables compression and error correction).

Another potential connection problem is your application getting confused by the CARRIER message. Some applications misinterpret this as a CONNECT message and begin sending data. This will cause the GeoPort Telecom Adapter to drop the connection. Since it is still negotiating the connection, it will abort the call if it receives any data prior to the CONNECT message. If this is the case, you may want to add a W0 command in the application's initialization string (this suppresses the CARRIER message).

Communication settings

If you are using a terminal emulator or communications program that supports the Apple Communications Toolbox, you should select the "Express Modem Tool" from the connection settings menu item. This tool's default settings will always try to establish connections at the highest possible speed with error correction and compression enabled.

Identifying incoming calls

When answering your phone line, the GeoPort Telecom Adapter will attempt to determine the type of incoming call (fax, voice, or data) before transferring the call to a telephony application. Incoming fax calls are easily detected since the sending fax machine usually transmits a fax calling tone. Incoming data and voice calls are more difficult to detect since in many countries modems typically do not transmit a tone. In the Express Modem control panel, you can set the default call type for situations where no calling tone is detected. If you are using a voice telephony application (such as MegaPhone), we recommend that you select Voice as the default call type. If you are using a data telephony application (such as Apple Remote Access server), we recommend that you select Data as the default call type. If you expect to receive both voice and data calls, ask your callers to send a data calling tone when calling your machine. Use of these features is explained in detail in the Apple Telecom Upgrade Manual electronic document installed in the Telecom Documents folder.

If you have problems receiving calls from data modems (when using the Apple Remote Access dial back feature, for example), try decreasing the number of rings to Auto-answer in the Express Modem control panel (if permitted in your country). Some calling modems may time out and disconnect before your modem answers if the number of rings is too high.

Removing Fax Storage Folders

To protect your fax documents, the fax storage folders ("Fax Waiting To Be Sent", "Received Fax Documents", "Sent Fax Documents") are protected from accidental deletion. To bypass this mechanism, drag these folders to the trash, restart your computer, and then empty the trash. New, empty folders are created for you.

Using a Centris 660AV or Quadra 660AV/840AV

If you are using a Centris 660AV or Quadra 660AV/840AV and experience errors when attempting to establish a connection, you may need to change the audio settings on your computer. The default setting of 24.000 kHz is compatible with the GeoPort Telecom Adapter. To change this setting, open the sound control panel, choose "Sound Out" and select the "24.000 kHz" sampling rate.

Resetting a blacklisting error message

Regulations in France, Japan, and a few other countries require that the Express Modem software blacklist recently dialed numbers when the connection fails. If you receive a "BLACKLISTED" error message when dialing, you can reset the BLACKLISTED condition by turning the Express Modem control panel off and then on. This software reset, equivalent to turning off and on a hardware modem, is compliant with PTT regulations.

Clicking Sound from GeoPort Telecom Adapter

If your machine freezes, the GeoPort Telecom Adapter can lose its connection with your machine and may generate a rapid clicking sound. This sound is a temporary side-effect of the lost connection. To stop the clicking, unplug the adapter for a few seconds or restart your machine.

Port Selection

The interface for selecting the correct communications port has been simplified since GeoPort Telecom Adapter software versions 1.0.2 (Power Macintosh) and 1.2.2 (660AV/840AV). The "Use internal modem instead of modem port" checkbox has been removed from the Express Modem Control Panel. The Express Modem control panel now automatically detects whether a GeoPort Telecom Adapter is actually attached to the Modem port. If so, all serial communications are first processed by the Express Modem software and transmitted through the GeoPort Telecom Adapter. If not, serial communication passes through the modem port directly.

GeoPort has been removed from the list of ports. The Express Modem control panel now automatically detects whether a GeoPort Telecom Adapter is actually attached to the Modem port. Select Modem Port whenever you wish to communicate through the GeoPort Telecom Adapter.

What Goes Where

When you install the software using the Easy Install option of the Installer program, the following files and resources are installed on your hard disk.

Hard Disk:

- GeoPort Telecom Adapter ReadMe
- SimpleText 1.2

Hard Disk: Telecom Applications: Fax Folder:

- Fax Terminal
- Fax Viewer
- Fax Cover
- Sample (cover document)
- Standard (cover document)
- My First Fax (PICT sample)

Hard Disk: Telecom Documents:

- About OCR (OCR manual for users who upgrade electronically)
- About Apple Fax Gateway (Manual for users who upgrade electronically)
- About Fax Sender GX (Manual for users who upgrade electronically)
- Apple Telecom Upgrade Manual
- Express Modem CCL (AppleLink CCL)
- Modem AT Command Set
- GeoPort Telecom ARA 2.x/CNG (optional, transmits data calling tone)
- GeoPort Telecom ARA 1.x/CNG (optional, transmits data calling tone, 660/840AV only)

Hard Disk: System Folder: Control Panels:

- Express Modem

Hard Disk: System Folder: Extensions:

- Apple Fax Gateway
- Apple Telecom Modem
- Express Modem Tool

MegaPhone ReadMe (8/95)

Revised: 8/4/95
Security: Everyone

MegaPhone ReadMe (8/95)

=====

Article Created: 28 June 1995
Article Reviewed/Updated: 4 August 1995

TOPIC -----

This article is the MegaPhone Read Me file that comes with GeoPort 2.1 Telecom Adapter.

DISCUSSION -----

Please read this entire document carefully. It includes installation instructions and a description of the version of MegaPhone included with your new Power Macintosh.

MegaPhone is a screen-based telephone designed to work with the Macintosh Telephony Architecture and other features of the Macintosh Operating System such as PowerTalk. The version included on your new Macintosh is specifically designed to work in its basic mode with the GeoPort Telecom Adapter from Apple. However, you are able to use some features even without an adapter.

By default MegaPhone assumes that you do not have a GeoPort Telecom Adapter and uses the "DemoDialer Telephone Tool." Using this tool, MegaPhone can emit Touch Tone sounds through a Macintosh's speaker, but cannot answer incoming calls (because your Macintosh is not connected to a phone line). Running in this mode gives you a telephone dialer and a preview of what you could do with a GeoPort Telecom Adapter connected to your Macintosh.

PLEASE NOTE: Even though MegaPhone does not require a GeoPort Telecom Adapter, it does require that the Telephone Manager software be installed. To install the Telephone Manager software, you must install the Apple Telecom Software 2.1 in the Apple Extras folder on your Macintosh's hard drive. See the GeoPort Telecom Adapter ReadMe for further information.

If you already have a GeoPort Telecom Adapter and would like to use it with this Macintosh and this version of MegaPhone, please follow these steps:

..TIL18051-MegaPhone_ReadMe_8-95.pdf

Step 1

Install the Apple Telecom 2.1 software which is in the Telecom Software folder within the Apple Extras folder on your hard drive.

Step 2

Attach your GeoPort Telecom Adapter to the modem port on your Macintosh. IT CAN ONLY BE CONNECTED TO THE MODEM PORT.

Step 3

Launch MegaPhone.

Step 4

Select "Preferences..." from the "File" menu.

Step 5

Select "General" from the "Topic" pop-up menu in the Preferences dialog.

Step 6

At the bottom of the Preferences dialog is an area labeled "Hardware." Click on the "Change..." button in this area.

Step 7

Select the GeoPort Telephone Tool from the "Phone Type" pop-up menu.

Step 8

Click the OK button.

Step 9

You should now be back in the Preferences dialog. Click the OK button.

After this, you can use MegaPhone and your GeoPort Telecom Adapter to make and receive telephone calls.

At this point, MegaPhone is running in its basic mode. The full-featured MegaPhone has many convenient features to help you use your telephone more effectively. Please see the brochure included with your Macintosh for more information, or to order the full-featured MegaPhone, you can call Cypress Research at 1-800-515-8111, extension 3112. To receive more information via fax, you can call 1-800-CR-INFO-1, extension 3112.

Also, if you buy a GeoPort Telecom Adapter Kit (version 2.0 or later), a free 30-day trial of the full-featured MegaPhone is included. For the Power Macintosh 7200, 7500, 8500, and 9500 series, you need Apple Telecom Software 2.1 or later.

Apple Media Tool: v2.0 Frequently Asked Questions (1/96)

Revised: 1/17/96
Security: Everyone

Apple Media Tool: v2.0 Frequently Asked Questions (1/96)

=====

Article Created: 28 June 1995
Article Reviewed/Updated: 17 January 1996

TOPIC -----

This article lists frequently asked questions (FAQ) on the Apple Media Tool, version 2.0.

Questions Answered in this FAQ:
=====

- 1) Does the Apple Media Tool (AMT) support QuickTime VR and QuickDraw 3D?
- 2) Does the AMT come with some simple editing tools (like Persuasion, to create a colored background, simple graphics, etc.)?
- 3) What is involved in making a truly cross platform application? (I'm using AMT as an example of developing on the Mac and deliver on anything, from Mac to Windows to Pippin to SetTop boxes.)
- 4) What is involved in making a single CD that would be able to be read from a Macintosh or a Windows machine?
- 5) Do I always have to have the "Media" folder? Isn't there an option to make it a single document that could be sent over a network?

DISCUSSION -----

1) Question: Does the Apple Media Tool (AMT) support QuickTime VR and QuickDraw 3D?

Answer: Apple Media Tool 2.0 supports QuickTime 2.0, QuickTime VR, and QuickDraw 3D much better than version 1.2.

2) Question: Does the AMT come with some simple editing tools (like Persuasion,

to create a colored background, simple graphics, etc.)?)

Answer: The Apple Media Tool will probably never come with editors built-in because third party products almost always do a better job. You can use Persuasion as a simple editor from within the Apple Media Tool to create PICTs as backgrounds.

Examples of applications with built-in color graphics editors are Director and HyperCard 2.2/2.3. Not many people use these to build shipping multimedia projects. Most developers use PhotoShop or Fractal Design Painter as the graphics editor for anti-aliased text and more control over gradient ramps, textures, color control and file formats.

3) Question: What is involved in making a truly cross platform application? (I'm using AMT as an example of developing on the Mac and deliver on anything, from Mac to Windows to Pippin to SetTop boxes.)

Answer: Apple Media Tool is one of the only truly cross-platform development tools. It creates files that can be used on ISO 9660 CD-ROMs that will play on Macintosh computers, computers running Windows, Pippin products, and ITV setup boxes.

4) Question: What is involved in making a single CD that would be able to be read from a Macintosh or a Windows machine?

Answer: Creating an ISO 9660 CD-ROM is something that most CD-R authoring software does as one of its output options. Examples of CD-R authoring applications included Hybrid 1.1.2 from Sony, and Toast from Catalogic in Mountain View, California, which will create bootable CD-ROMs and Enhanced CD-ROMs that will play in audio CD players. There are many other packages on the market.

5) Question: Do I always have to have the "Media" folder? Isn't there an option to make it a single document that could be sent over a network?

Answer: You always have to create media assets that reside in folders separate from the project that you create. That is the way the Apple Media Tool was designed. This feature makes it better than Macromedia Director. You can change the media assets at any time in the future without changing the source code to the project and re-compiling everything.

Personal LaserWriter LS: Time Out Error (6/95)

Revised: 6/28/95
Security: Everyone

Personal LaserWriter LS: Time Out Error (6/95)

=====

Article Created: 28 June 1995

TOPIC -----

I am using System 7.5 and a Personal LaserWriter LS printer. When I attempt to print from any application, I intermittently get an error message stating that there is a receive time out error and to check the Peripheral-8 cable.

DISCUSSION -----

This error occurs when using the LaserWriter LS driver and System 7.5. The correct driver to use with the LaserWriter LS and System 7.5 is the LaserWriter 300 driver (v. 1.2). This version of the LaserWriter 300 driver is included with System 7.5, and it is also available on the online services.

CLW 12/600 PS & CLW 12/660 PS: Memory Configuration (5/97)

Revised: 5/2/97
Security: Everyone

CLW 12/600 PS & CLW 12/660 PS: Memory Configuration (5/97)

Article Created: 28 June 1995
Article Reviewed/Updated: 02 May 1997

TOPIC -----

This article describes the memory configuration and expansion on the Color LaserWriter 12/600 PS and Color LaserWriter 12/660 PS printers.

DISCUSSION -----

The Color LaserWriter 12/600 PS and Color LaserWriter 12/660 PS printers include 8 MB on the logic board as well as two SIMM expansion slots.

The standard RAM configuration of the Color LaserWriter 12/600 PS is 12 MB, which includes a 4 MB SIMM installed in one of the two SIMM slots. The Color LaserWriter 12/660 PS printer has 16 MB of RAM, which includes two 4 MB SIMMs in both of the SIMM slots.

The memory of both Color LaserWriter printers is expandable to 40 MB using standard 72-pin, 60ns SIMMs, 2K and 4K refresh in 1, 4, or 16 MB configurations. It is possible to mix SIMMs of different sizes in the two slots.

The table below lists the possible DRAM configurations for 1 MB, 4 MB, and 16 MB SIMMs installed in the printer.

DRAM configurations for the Color LaserWriter 12/600 PS and Color LaserWriter 12/660 PS:

Begin_Table

SIMM slot J10	SIMM slot J11	Total Installed DRAM
-----	-----	-----
4 MB	0 MB	12 MB*
4 MB	1 MB	13 MB
4 MB	4 MB	16 MB**
16 MB	0 MB	24 MB

16 MB	1 MB	25 MB
16 MB	4 MB	28 MB
16 MB	16 MB	40 MB

* Color LaserWriter 12/600 PS shipped configuration

** Color LaserWriter 12/660 PS shipped configuration

End_Table

NOTE:

When installing memory simms of different sizes, the larger simm always goes in slot J10.

It is important to remember, however, that you must use single-sided memory SIMMs when upgrading the printer's memory, if you intend to fill both memory slots. Double-sided SIMMs are recognized as two individual memory banks and could, therefore, cause problems when the printer attempts to address the memory SIMM in the other slot.

IMPORTANT:

You CANNOT use 8 MB SIMMS in either the Color LaserWriter 12/600 PS or the Color LaserWriter 12/660 PS printer.

Article Change History:

23 Octob 1996 - Updated to include current models.

02 May 1997 - Corrected error in simm installation note.

Token Ring 4/16 NB & Token Ring NB/c Differences (6/95)

Revised: 6/28/95
Security: Everyone

Token Ring 4/16 NB & Token Ring NB/c Differences (6/95)

=====

Article Created: 28 June 1995

TOPIC -----

What are the differences between the Apple Token Ring 4/16 NB Card and the Apple Token Ring NB/c Card?

DISCUSSION -----

The Apple Token Ring 4/16 NB Card is a 9-inch bus master network interface card. The card operates independently of the main Macintosh processor, executing multiple networking protocols or network application programs concurrently.

The Apple Token Ring NB/c Card was designed to the 2.0 NuBus specifications, and it functions as a NuBus slave device. As a NuBus slave, it will relinquish control of all of its internal resources to the NuBus master.

In summary, the Apple Token Ring 4/16 NB Card can be configured to be a bus master or a slave device, whereas the Token Ring NB/c Card can only be configured as a slave device.

Power Macintosh 9500 Series: Frequently Asked Questions (5/96)

=====

Article Created: 28 June 1995
Article Reviewed/Updated: 20 May 1996

TOPIC -----

This article includes Frequently Asked Questions (FAQ) about the Power Macintosh 9500 Series computers.

Questions in this FAQ:
=====

- 1) If I add more memory to my system, what kind do I need?
- 2) Which DIMMs are supported?
- 3) How much benefit is gained from interleaving?
- 4) Does this Power Macintosh use the same self-terminating connectors as the original Power Macintosh?
- 5) Is the Power Switch a "hard switch"?
- 6) Can NuBus cards be used with these Power Macintosh computers?
- 7) Can these Power Macintosh computers accommodate any PCI card?
- 8) Are these computers PCI card plug-and-play?
- 9) Which version of Mac OS should be used with the Power Macintosh 9500/120 and 9500/132 computers?
- 10) How does "processor upgradeability" work?
- 11) My computer came with Open Transport 1.0, and my PPP software says I need version 1.0.7. How can I get version 1.0.7?

12) I started my Power Macintosh computer from the startup CD, but Disk First Aid says "files are open" and won't allow me to click on Repair. How can I close those files and repair the directory?

13) I have an old program that requires fewer than 256 colors, but in the Monitors control panel I cannot select anything lower than 256 colors.

14) As my computer starts up, my display flashes off and back on again. Why?

15) How can I obtain the built-in Ethernet address for my computer?

16) I have a GeoPort Telecom Adapter. What version of the Apple Telecom software should I be using?

17) What causes Type 11 errors?

18) 5) Question: I need to run DOS software on my Power Macintosh 9500 series computer. What are my options?

DISCUSSION -----

1) Question: If I add more memory to my system, what kind do I need?

Answer: You need Dual Inline Memory Modules (DIMMs) that are 64-bit-wide, 168-pin, fast-paged mode, 70 nanosecond RAM.

2) Question: Which DIMMs are supported?

Answer: The 4, 8, 16, 32, and 64 MB DIMMs are supported.

3) Question: How much benefit is gained from interleaving?

Answer: Interleaving provides maximum performance to you. If the DIMMs are not paired in the A and B slots, the system does not perform to its capability. Interleaving lets the computer read and write data to memory at the same time other reads and writes are occurring. This improves performance. DIMMs need to be the same size for interleaving to work.

4) Question: Does this Power Macintosh use the same self-terminating connectors as the original Power Macintosh?

Answer: Yes, the self-terminating connector is the same.

5) Question: Is the Power Switch a "hard switch"?

Answer: No. It is a "smart switch". You cannot turn off power by just pressing the power actuator button. If you press the Power Key, it quits all applications and shuts down the machine.

6) Question: Can NuBus cards be used with these Power Macintosh computers?

Answer: NuBus cards cannot be used in this Power Macintosh. However, to preserve your investment in NuBus technology, a NuBus expansion chassis for PCI will be available from Second Wave, Inc. This chassis will enable you to continue to use your existing NuBus cards in Power Macintosh systems with PCI slots.

7) Question: Can these Power Macintosh computers accommodate any PCI card?

Answer: These systems support any PCI 2.0-compliant card. However, a Mac OS-specific software driver is required for each card, just as PCI drivers are required for any other operating system.

8) Question: Are these computers PCI card plug-and-play?

Answer: For the most part, yes. The PCI card needs to include either a Mac OS driver or a new ROM so the Mac OS can recognize it.

9) Question: Which version of Mac OS should be used with the Power Macintosh 9500/120 and 9500/132 computers?

Answer: The minimum system software these computers use is Mac OS version 7.5.2. However, we recommend using the System 7.5 Update 2.0 to upgrade to Mac OS version 7.5.3. The update is available online for download from the Apple Software Updates areas.

If you do not have access to an online service or the Internet, then you can order the update on CD-ROM or floppies in the U.S. for a \$13 shipping and handling fee. The number to call in the United States to order the update is 1-800-293-6617, ext. 984.

10) Question: How does "processor upgradeability" work?

Answer: Power Macintosh 9500 series computers are equipped with a removable processor card. This processor card can be replaced with a more powerful processor card.

Apple currently offers The Power Macintosh Processor Upgrade Card in two processor speeds: one with a 120-megahertz PowerPC 604 RISC processor, and the other with the even more powerful 132-megahertz PowerPC 604.

Power Macintosh 9500 series computers that are capable of accepting processor upgrade cards will be able to support cards of up to 200 MHz, as they become available.

11) Question: My computer came with Open Transport 1.0 and my PPP software says I need version 1.0.7. How can I get version 1.0.7?

Answer: We recommend updating to Open Transport 1.1 which is installed by the System 7.5 Update 2.0. See the answer to question 9 on how to obtain a copy of the update.

12) Question: I started my Power Macintosh computer from the startup CD, but Disk First Aid says "files are open" and won't allow me to click on Repair. How can I close those files and repair the directory?

Answer: Virtual memory is active when started from the Power Macintosh CD. Here are two ways to disable virtual memory:

- Insert the CD into the computer. Open the Startup Disk control panel and select the Power Macintosh CD. Restart the computer and hold down the Shift key. Release the Shift key when you see the Extensions Off message at the Welcome to Macintosh screen. Virtual memory is now off and Disk First Aid should be able to attempt repairs.

- Start the computer with the Power Macintosh CD in the drive and hold down the C key. When you see the happy Macintosh on the screen, immediately release the C key and hold down the Shift key. Release Shift when you see the Extensions Off message at the Welcome to Macintosh screen. Virtual memory is now off and Disk First Aid should be able to attempt repairs.

13) Question: I have an old program that requires fewer than 256 colors, but in the Monitors control panel I cannot select anything lower than 256 colors. What can I do?

Answer: The built-in video does not support fewer than 256 colors or grays. If you have a program that requires black and white, 4, or 16 colors to run, then you cannot run these programs. Check with the software vendor for availability of a compatible version. You could also check with video card vendors to see if any offer support for fewer than 256 colors.

14) Question: As my computer starts up, my display flashes off and back on again. Why?

Answer: The software video driver for the monitor is loading up. This is normal and is addressed in the Power Macintosh 7200/9500 Read Me file.

15) Question: How can I obtain the built-in Ethernet address for my computer?

Answer: With Mac OS 7.5.2, the Apple LAN Utility version 1.0b4e1 can obtain the built-in Ethernet address in the Power Macintosh 9500 series computers. While this utility is not supported by Apple, it is available on the online services.

The Tech Info Library article, "Power Macintosh 9500: Can't Get Ethernet Address", has additional steps to get the hardware address if you connect to a

UNIX host.

We recommend updating to Mac OS 7.5.3 using the System 7.5 Update 2.0. With the update install you can then choose Get Info from under the File menu when in the AppleTalk and TCP/IP control panels to get the built-in Ethernet address.

16) Question: I have a GeoPort Telecom Adapter. What version of the Apple Telecom software should I be using?

Answer: You should use at least Apple Telecom 2.2. Apple Telecom 2.3 is the current version but adds no additional functionality to the Power Macintosh 9500. Note that currently you must have AppleTalk inactive or set to the Ethernet port for the GeoPort to work correctly. This will be addressed in a future update of the system software.

Note: Apple Telecom 2.2 or later will install the Audio Tuneup extension into the Extensions folder. This is not needed when the System 7.5 Update 2.0 is installed and the installer will remove it if present. If you install the Apple Telecom software after installing the update, then remove the Audio Tuneup file from the Extensions folder or reinstall the update.

17) Question: What causes Type 11 errors?

Answer: Type 11 errors are typically due to one of a variety of factors:

- Font problems: you are using a bad font.
- Incompatible software running in emulation.
- SCSI chain problems: bad driver or cable.
- Cache SIMM problems (if you have installed one on your Power Macintosh computer).
- RAM problems: bad RAM has been installed.

For steps on how to troubleshoot such problems, use the search string "type 11 power" to locate the Tech Info Library article, "Power Macintosh: Meaning of Error Type 11." Use the search string "sys7 extension troubleshoot" to locate the article "Troubleshooting Macintosh System 7 INIT Conflicts."

18) Question: I need to run DOS software on my Power Macintosh 9500 series computer. What are my options?

Answer: With a Power Macintosh 9500 series computer, there are several ways to accomplish this.

- Apple offers two PC Compatibility cards featuring either a Pentium 100-megahertz processor on a 12-inch card (M4092LL/A) or a 586 100-megahertz processor on a 7-inch card (M4091LL/A). These PC Compatibility Cards let you run MS-DOS and Windows applications directly on your Power Macintosh computer. You can switch instantly between Mac OS, Windows, and MS-DOS environments with a single keystroke.

- Orange Micro has announced a version of their Orange PC card for PCI based

Power Macintosh computers. The Orange PC cards use an expansion slot inside of your Power Macintosh 9500 series computer. You can get more information by contacting Orange Micro directly. Their phone number is 714-779-2772.

- Reply, Inc. has also announced a version of their DOS on Mac card for PCI based Power Macintosh computers. The Reply cards use an expansion slot inside of your Power Macintosh 9500 series computer. You can get more information by contacting Reply directly. Their phone number is 800-801-6898.

- You can use Insignia Solutions' SoftWindows emulator. This is a Macintosh application which emulates a PC DOS/Windows environment. You can get more information, such as pricing, performance, system requirements, and compatibility information from Insignia by calling them at 800-848-7677.

These articles can help you answer additional questions you may have about the Power Macintosh 9500 series computers:

LaserWriter 8.3: Read Me (4/97)

Revised: 4/2/97
Security: Everyone

LaserWriter 8.3: Read Me (4/97)

=====
Article Created: 29 June 1995
Article Reviewed/Updated: 02 April 1997

TOPIC -----

The following article is the Read Me document for the LaserWriter 8.3 driver software.

DISCUSSION -----

About Your Apple Macintosh LaserWriter Printer Software

=====
This document contains some important reminders and some information that is not in the manual that comes with your printer. You may want to print this document and keep it for future reference. The topics are:

- Installing the Printer Driver Software
- Using the Apple Color LaserWriter 12/600 PS Printer
- Obtaining Printer Supplies for the Apple Color LaserWriter 12/600 PS
- Desktop PrintMonitor Version 1.0.1
- Apple Printer Utility Version 2.0
- LaserWriter 8 Printer Driver Version 8.3

Installing the Printer Driver Software

=====
The manual that came with your printer contains detailed installation instructions. You cannot install the software and fonts by dragging their icons to your hard disk; you must use the Installer program as described in the printer manual. Your Macintosh must have System 7.1 or later. The printer software does not support QuickDraw GX systems.

IMPORTANT: Before installing the printer software, restart your system with all Extensions turned off. To do this, hold down the Shift key while you restart your computer. Hold the Shift key down until you see the message "Extensions off" or until your normal desktop appears.

The Installer does not remove versions of the LaserWriter printer driver earlier than version 8.0. If you no longer need these files, you may remove them from your System Folder.

The Installer does remove earlier versions of the LaserWriter 8 driver (for example, LaserWriter 8.0) and replaces the PPD files for Apple LaserWriter printers with the latest versions.

When you choose Easy Install, the Installer places the following files in the System Folder on your hard disk:

- LaserWriter 8.3 is placed in the Extensions folder.
- The PPD files used by LaserWriter 8 are placed in the Printer Descriptions folder inside the Extensions folder.
- TrueType fonts are installed in the Fonts folder.
- The Apple Printer Utility and this Read Me file are placed in the Apple LaserWriter Software folder.
- For desktop printing, Desktop Print Monitor, Desktop Printer Spooler, and Desktop Printer Extension are placed in the Extensions folder.
- ColorSync 2.0 is placed in the Extensions folder. The ColorSync profiles are placed in a folder called ColorSync Profiles (in the Preferences folder inside the System Folder). The ColorSync System Profile control panel is placed in the Control Panels folder (inside the System Folder).
- If your system has System Software 7.1.1, Finder 7.1.3 is placed in your System Folder, and Finder Help 7.1.3 is placed in the Extensions folder.
- If your system has System 7.1.1 or 7.1.2, these files are placed in the Extensions folder: Thread Manager 2.1, Network Extension 7.1.3, Macintosh Drag and Drop 1.1, and Dragging Enabler.

IMPORTANT: If the Installer is unable to remove old files from your hard disk, it will terminate the installation procedure. If this happens, please remove old copies of the LaserWriter 8 driver and the PPD files. Then move your Fonts folder from the System Folder to the desktop. Run the Installer again. Once installation is complete, move the fonts from the Fonts folder on the desktop back to the new Fonts folder in your System Folder.

Using the Apple Color LaserWriter 12/600 PS Printer

=====

This section provides additional information on using the Color LaserWriter 12/600 PS Printer.

About the Demonstration Page

When the power is turned on, the Color LaserWriter 12/600 PS automatically prints a startup page and a demonstration page. For legal and B5 paper sizes, only the startup page prints; the demonstration page is not printed. You can use the Apple Printer Utility to turn off the printing of the startup and demonstration pages.

About the Apple Color LaserWriter 12/600 PS Status Panel

As described in the Color LaserWriter 12/600 PS manual, Appendix G, the status panel lights aid in indicating hardware service problems found during printer startup. If the Alert light is flashing and all the door lights are flashing, check all the printer doors; one of them is open. If the Paper Out and Paper Jam lights are blinking alternately, a hardware problem has been detected. To identify the problem, notice which toner lights (C, M, Y, Bk) and how many of the maintenance lights (in the area on the right-hand side of the status panel) are on, and refer to the table below. Each area listed under "Problem" represents a general circuit area for the service technician to investigate, not necessarily the exact cause of the problem.

If you have an external SCSI hard disk drive attached but don't turn it on before you turn on the printer's power, the printer may indicate a hardware failure. To correct the problem, turn the hard disk drive on and restart the printer.

Obtaining the Best Results for Business Graphics

To obtain the best results for business graphics, colors should be 100% saturated. For example, to print pure yellow, define yellow as 100% red and 100% green without any blue. Then print your document, selecting the Color/Grayscale option in the Print Options dialog.

Printing on Legal-Size Paper

In the standard memory configuration, the Color LaserWriter 12/600 PS uses a higher compression technique for legal-size paper using only the cyan, magenta, and yellow colors. As a result of this compression technique, very complex pages may show missing pixels in fine lines or small text, "jaggies" (edges with low-resolution appearance), and color changes. To improve the image quality of such pages, you can increase the printer's memory to 16 MB or more. With at least 16 MB of printer memory, the Color LaserWriter 12/600 PS can achieve the same quality with legal-size pages as with letter and A4 sizes using all four colors (cyan, magenta, yellow, and black.)

Printing Images on the Color LaserWriter 12/600 PS Printer

The Color LaserWriter 12/600 PS Printer's highest resolution for printing images is 150 x 150 dpi. No gain in image quality is achieved if higher resolution images are used. All other types of documents print at 600 x 600 dpi.

Avoiding Hue Shifts When Printing to File

When you save an image in an Encapsulated PostScript (EPS) file all the PostScript settings relating to the original output device in effect are saved along with the image data. When the image is printed later, the settings that were in effect may cause major hue shifts. To prevent these hue shifts save the image in TIFF format instead of EPS.

The Density Control Panel

The Color LaserWriter 12/600 PS has been adjusted at the factory to produce the best possible image quality. However, small variations exist among different printers. To make subtle changes to image quality, you can use the Density Control Panel on the back of the printer. NOTE: If changing the settings produces inferior image quality, return to the factory settings by following these steps: Select each color using the Color Select button, then press the - or + button to move the indicator light to the center position. When the indicator is in the center, press Enter to make the setting permanent. Repeat this procedure for all four colors.

Printer's Processor Speed

In the printer manual, Appendix A contains a typographical error: the microprocessor speed is 30 MHz, not 25 MHz as printed.

Setting Your ColorSync System Profile for Best Printing Results

Before using ColorSync color matching to print to the Color LaserWriter 12/600 PS printer, set the ColorSync System Profile for the monitor connected to your system. To do this, open Control Panels in the System Folder and double-click ColorSync System Profile. Make sure the following settings are selected:

- Set the profile for the monitor connected to your system. For the best color match when printing, select the "page-white" or "D50" system profile for your type of monitor if one is available.
- For the best visual match between the colors on your monitor and printed colors, select the Page-White Gamma option in the Monitors control panel. To select a gamma option, open the Monitors control panel, then hold down the Option key while you click the Options button. In the Options window, click the Use Special Gamma checkbox to put an X in it. Then choose Page-White Gamma from the list.
- On a multiscan monitor, make sure that the color temperature, or intensity, is set to 9300K (the default setting). See the monitor manual for instructions. If the Page-White Gamma option is selected with a color temperature other than 9300K, your monitor colors could look too red or too blue compared to printed colors.

Obtaining Printer Supplies for the Apple Color LaserWriter 12/600 PS

To order printer supplies for the Color LaserWriter 12/600 PS direct from Apple, call 1-800-600-7805. For order numbers, see Appendix A of the printer manual:

- toner cartridges
- transparencies
- photoconductor cartridge (includes toner disposal boxes)
- fuser oil
- fuser

Instructions for replacing the fuser are in Appendix F of the printer manual. Instructions for replacing other printer parts come in the new packages.

For the location of the nearest Apple-authorized dealer, call 1-800-538-9696, extension 525.

Desktop PrintMonitor Version 1.0.1

=====

Creating Desktop Printers

You create desktop printers by selecting a printer in the Chooser. When you close the Chooser, the desktop printer icon is created.

System Software Requirements for Desktop Printing

Desktop printing requires System 7.1.1 (System 7 Pro) or greater. If you have System 7.1 and you want to use desktop printing, you can upgrade your Macintosh to use a later version of System software. Contact your Apple-authorized dealer.

Using Desktop PrintMonitor on a Non-English System

If no desktop printer icon appears after you install the printer software, it may mean the Installer installed PrintMonitor 7.1.2 and did not install the Desktop PrintMonitor. (PrintMonitor 7.1.2 is installed if you have an earlier version of the PrintMonitor. Later versions of the PrintMonitor are not replaced.) You have three choices:

- Use PrintMonitor 7.1.2 (or a later version).
- Obtain a set of installation disks for the printer software in the language of your system software from your Apple-authorized dealer and install it.
- Upgrade your system software to System 7.5 and install the printing software again. An English language version of the Desktop PrintMonitor is installed.

Removing the Desktop Printing Software

The desktop printing software uses both the Desktop PrintMonitor and the PrintMonitor software. The Desktop PrintMonitor requires 200-400K of memory in addition to the memory required by the PrintMonitor. If you don't want to use the desktop printing software, you can remove it. Follow these steps:

1. Drag any print spool files found in the PrintMonitor Documents folder (in the System Folder) to the Trash. Warning: these jobs will not be printed.
2. Restart your computer with the extensions off by holding down the Shift key and choosing Restart from the Special menu. Hold the Shift key down until the message "Extensions off" appears or until your normal desktop appears.
3. Drag the following files from the Extensions folder to the Trash:
 - Desktop PrintMonitor 1.0.1
 - Desktop Printer Spooler 1.0.2
 - Desktop Printer Extension 1.0.1.
4. Restart your computer.

Using Save or Open With Desktop Printers

When you choose Save or Open in your application programs, you will see your desktop printers listed as if they were folders, but you should not save or open any documents in them. If you do, you will not be able to access your documents.

Having More Than Five Desktop Printers

If you want to have more than five or six desktop printers, you must increase the Desktop PrintMonitor memory allocation by 10K for each additional desktop printer you want. To do so, select the Desktop PrintMonitor icon (it's in the Extensions folder inside the System Folder), choose Get Info, type a larger number in the Preferred Size box, then close the Get Info window.

Apple Printer Utility Version 2.0

Installing the printer software creates the Apple LaserWriter Software folder containing this Read Me file and the Apple Printer Utility program version 2.0. The Apple Printer Utility program works with all Apple PostScript Level 2 printers.

Downloading PostScript Fonts on a GX System With the Apple Printer Utility

When GX is installed, any PostScript fonts (often called Type 1 fonts) in the Fonts folder are converted to GX fonts, and the original PostScript fonts are copied to a new folder called Archived Type 1 Fonts in the System Folder. If you want to download these fonts to your printer, use the Apple Printer Utility to send the fonts in the Archived Type 1 Fonts folder, not the GX-converted versions in the Fonts folder.

Removing Fonts From a Hard Disk Attached to the Printer

If a font is downloaded to both the printer's RAM and the printer's hard disk with the same name, and you remove the font on the hard disk, the RAM font will also be removed. If you remove the RAM font, the font on the hard disk will not be removed.

LaserWriter 8 Printer Driver Version 8.3

The software includes version 8.3 of the Apple LaserWriter 8 printer driver, which works with many Apple LaserWriter printers. This section contains information about the software and information on using it with several of the printers.

What's New in Version 8.3

=====

LaserWriter 8 now provides support for color matching and for embedded JPEG-compressed documents. LaserWriter 8 now supports ColorSync 2.0, Apple's latest system software for device-independent color-matching services, and PostScript Level 2 color matching.

Using Color Matching

When ColorSync 2.0 is installed and the ColorSync Profiles folder contains printer profile(s), there are two new options in addition to color/grayscale output:

- ColorSync Color Matching invokes the ColorSync system software to perform color matching for the printed document, matching your monitor and printer's profile and sending the correct CMYK information to the printer. With ColorSync

Color Matching, most of the work is done by your Macintosh.

- PostScript Color Matching is an alternative to ColorSync Color Matching. When you are printing to a PostScript Level 2 printer, and it is efficient to let the printer do most of the work, this option is a good choice.

Here are some tips on using color matching:

- Color output will vary depending on the application you are using.
- Documents that use ColorSync 1.0 embedded profiles convert to the profile set up in the ColorSync 2.0 System Profile control panel.
- When you print with PostScript Color Matching selected and ColorSync 2.0 is not installed, the driver uses the Apple 13" RGB Standard profile.
- Application programs that generate their own PostScript may have problems color matching EPS or TIFF images correctly. Converting the image to a PICT corrects the problem.

PPD Files

=====

The LaserWriter 8 driver uses PostScript Printer Description (PPD) files to determine the characteristics of the printers it uses. PPD files contain information about individual PostScript printers. For example, PPD files describe the paper-handling capabilities of printers: the number of paper trays, their capacity, and the paper sizes they handle.

To take full advantage of your printer's features, you need to go through a simple setup procedure. When selecting your printer for the first time, or after installing an additional option, click the Setup button in the Chooser. This procedure causes the LaserWriter driver to query the printer for its characteristics and associate a particular PPD file with the printer.

Creating EPS Files

=====

You can create an Encapsulated PostScript (EPS) file in many application programs by clicking File in the Print dialog box, then clicking Save. When you create an EPS file, note the following:

- Creating EPS files with the All option selected in the Font Inclusion pop-up menu in the EPS dialog box can result in very large files. If you include all fonts in an EPS file and save the file with the Unlimited Downloadable Fonts option selected, you may create an extremely large file.
- If you create an EPS file with no fonts included and open the document, fonts in the document appear on your screen, but Courier may be substituted when you print.
- When you create EPS files with preview information included, other programs that create their own PostScript code may not display the EPS file accurately on the screen.

Using the LaserWriter 8 Driver With LaserWriter Printers

=====

When using the LaserWriter 8 driver, you should be aware of the following situations. Some happen with all LaserWriter printers, and others happen only with specific models.

All LaserWriter Printers

- The LaserWriter 8 driver allows some printers to print using a larger imageable print area on the page. If your printer does so, you may find that text in some documents reflows or is clipped to fit the new imageable area. To maintain your document format when printing to different printer models, deselect the Larger Print Area option in the Page Setup Options dialog box.
- Some older printers with small amounts of memory will not print documents containing large numbers of fonts unless you select the Unlimited Downloadable Fonts option in the Page Setup Options dialog box. If a document using multiple fonts doesn't print using the LaserWriter 8 driver, try selecting Unlimited Downloadable Fonts in the Page Setup Options dialog box and print again.
- Printing multiple documents with the Finder may not work if the documents have been created by different application programs.
- If you encounter a timeout (PostScript error -8993) when printing multiple copies of large and complex documents in the background, print the documents one at a time or select foreground printing to avoid this problem.

LaserWriter 16/600 PS

If Tray Switching is turned on and you have an optional 500-sheet feeder that contains the same size paper as the 250-sheet feeder, use the 500-sheet feeder as the preferred paper source for optimal printing performance. See the manual that came with your printer for instructions on selecting the 500-sheet feeder as the preferred paper source.

LaserWriter Pro 810

- With some graphics programs, bitmapped graphics printed with the Precision Bitmap Alignment option in the Page Setup Options dialog box will be reduced in size by 25%.

LaserWriter Pro 600 and 630

- When you print envelopes from the optional envelope feeder, you cannot use Auto Select as the Paper Source (in the Print dialog box).
- When you print at a resolution of 600 dots per inch (dpi), bitmapped images may appear with lines across the image.

LaserWriter II NT and II NTX

- If you select both the Smooth Graphics and the Invert Image options in the Page Setup Options dialog box, a PostScript error results.

- Do not use the B5 tray to print envelopes on a LaserWriter II NT. Use the letter tray instead.

LaserWriter IIg and IIx

- When you select paper sources from the First From and Remaining From pop-up menus in the Print dialog box, selecting Manual Feed for either source sets the driver to print the first page from the manual feed tray.
- The US Legal paper size has been changed on some LaserWriter IIx/IIg printers to be more compatible with other Apple LaserWriter printers. If your legal-size documents no longer fit on the page, select Larger Print Area in the Page Setup Options dialog box.
- Some form-printing application programs cannot print forms using the Layout settings in the Page Setup dialog box.

Using the LaserWriter 8 Driver With the Kanji System

To print Japanese characters using KanjiTalk or the Japanese Language Kit, your system must have WorldScript II version 7.5.1 or later.

Using the LaserWriter 8 Driver With Application Programs

Some application programs do not yet take advantage of the new features of the LaserWriter 8 driver or have small incompatibilities that result in printing problems. If you experience problems with a program, contact the publisher of the program. In some cases a newer version of the program may be available.

The following list describes some special cases that you should be aware of when working with some application programs. (There may be other problems with these programs, or with other programs, not mentioned in this document.)

- Color output will vary depending on the application you are using.
- With many application programs, you cannot use the Flip Horizontal, Flip Vertical, landscape page orientation, and Layout option in the Page Setup dialog box in combination.
- Some programs may not be able to print from the Finder or use the Drag and Drop printing feature.
- Some programs may print in color when Black and White mode is selected.
- Programs that generate their own PostScript may have problems color matching EPS or TIFF images correctly. Converting the image to a PICT corrects the problem.

Adobe Illustrator 5.5

- Multiple-page documents may not print correctly when you choose a page layout from the Layout pop-up menu in the Page Setup dialog box.

Aldus Freehand 4.0 & Freehand 5.0

- Documents do not print correctly when you choose a page layout from the Layout pop-up menu in the Page Setup dialog box.
- Some paper sizes in Freehand may not be supported by the printer and may generate Postscript errors.

Aldus PageMaker 5.0

- Documents that have been set up using a page layout from the Layout pop-up menu may not print correctly with the Print-Option command; use the Print command with PageMaker's Thumbnail option.
- When using a page layout from the Layout pop-up menu with the Print-Option command, the document will be printed in reverse order.
- Rotated graphics may not print correctly when you hold down the Option key and click Print in the Print dialog box.
- You cannot print legal-size documents from the paper cassette of the Personal LaserWriter 320; print such documents by selecting Manual Feed or by holding down the Option key and clicking Print in the Print dialog box.

Aldus Personal Press 2.02

- Using several font style combinations in text can result in spacing problems.

Aldus SuperPaint 3.5

- Rotated or filled polygons print as solid gray objects.
- Gradient fills may not print when copied into other programs.

Canvas 3.5.2

- When you select the Substitute Fonts option in the Page Setup Options dialog box, text may be incorrectly spaced if you use the Geneva, New York, or Monaco fonts.

ClarisDraw 1.0

- Some shapes that contain gradients may not print correctly.

CricketDraw III 2.01

- When you choose a page layout from the Layout pop-up menu in the Page Setup dialog box, underlined TrueType fonts may not print.

CricketPresents 2.1

- You cannot import an EPS file created with the LaserWriter 8 driver when it has been saved without preview information.

DeltaGraph Pro 3.0.4

- Printing with Unlimited Downloadable Fonts may cause some elements to be shifted and fonts to substitute Courier.

FileMaker Pro 2.1

- When you choose a page layout from the Layout pop-up menu in the Page Setup dialog box, documents that contain EPS graphics may appear clipped when printed.

Informed Designer/Manager 1.4.2

- Do not print documents that contain JPEG images in Black and White mode; your system will restart.
- When you select the Unlimited Downloadable Fonts option, some graphic elements may shift or disappear when printed.

MacDraft 3.01 and earlier versions

- When you print using the Cut Marks option, a PostScript error results.

MacDraw Pro 1.5

- Rotated text within a frame that is placed in another application program may not print correctly.

MacWrite Pro

- Colored text with colored underlines may not print correctly from the Finder.

Microsoft Excel 5.0

- Colored horizontal cell borders will often not appear in the printout. This happens with any color printing option and on most printers.

Microsoft PowerPoint 3.0

- Polygons and ovals filled with gradients and without a border line may shift locations on the page when printed.

Microsoft Works 3.0

- Printing documents that have rotated objects with rounded corners results in a PostScript error.

Microsoft Works 4.0

- There are 24 new shapes available through the tools palette. Colored shadows for any of these shapes will appear correctly on screen. But these colored shadows will only print in gray, regardless of what the print color options

might be.

Painter 3.0

- When you print using the Invert option, images do not print inverted correctly.

PixelPaint Pro 3.0
